Merger review by two federal agencies can impose significant and duplicative costs on both the merging parties and the agencies.[38] In addition, it can lead to conflicts between the antitrust agencies and the regulatory agency. The Commission has considered how to structure merger review in industries still subject to some degree of regulation. The Commission makes the following recommendations.

69. Even in industries subject to economic regulation, the antitrust agencies generally should have full merger enforcement authority under the Clayton Act.*

* Commissioner Kempf does not join this recommendation.

AR_002930

70. For mergers in regulated industries, the relevant antitrust agency should perform the competition analysis. The relevant regulatory authority should not re-do the competition analysis of the antitrust agency.

71. The federal antitrust agencies and other regulatory agencies should consult on the effects of regulation on competition.

72. The antitrust enforcement agencies and courts should take account of the competitive characteristics of regulated industries, including the effects of regulation.

73. Mergers in regulated industries should be subject to the requirements of the Hart-Scott-Rodino Act, if they meet the tests for its applicability, or to an equivalent pre-merger notification and investigation procedure, such as set forth in the banking statutes, so that the relevant antitrust agency can conduct a timely and well-informed review of the proposed merger.*

The Commission is not convinced that the public interest factors the regulatory agencies may take into account cannot be provided by competition, or should ever outweigh the substantial negative impact on consumer welfare that may result from the approval of an anticompetitive merger. If competition can provide the public interest benefits identified in the statute, or if those public interest benefits could never outweigh likely anticompetitive effects, then merger review by a regulatory agency would be unnecessary. Accordingly, the Commission makes the following recommendation.

74. Congress should periodically review all instances in which a regulatory agency reviews proposed mergers or acquisitions under the agency's "public interest" standard to determine whether in fact such regulatory review is necessary.

- **In its reevaluation, Congress should consider whether particular, identified interests exist that an antitrust agency's review of the proposed transaction's likely competitive effects under Section 7 of the Clayton Act would not adequately protect. Such "particular, identified interests" would be interests other than those consumers' interests—such as lower prices, higher quality, and desired product choices—served by maintaining competition.**

* Commissioner Kempf does not join this recommendation.

C. The State Action Doctrine

1. The Origin and Contours of the State Action Doctrine

The states, like the federal government, generally rely on competition in the marketplace to produce lower prices, higher quality, and incentive to innovate. Nonetheless, also like the federal government, sovereign states can and do enact economic regulations to displace competition in particular situations. Over sixty years ago, in *Parker v. Brown*, the Supreme Court created the "state action" doctrine to identify circumstances in which a state's decision to displace competition with regulation trumps the general federal policy in favor of free markets and, therefore, overrides the application of federal antitrust law.[39] In upholding the legality of a California regulatory program that limited raisin output and thereby raised raisin prices, the Court concluded that Congress did not intend the Sherman Act expressly to preempt state economic regulation.[40] The Court explained, "In a dual system of government in which, under the Constitution, the states are sovereign, save only as Congress may constitutionally subtract from their authority, an unexpressed purpose to nullify a state's control over its officers and agents is not lightly to be attributed to Congress."[41]

Under the state action doctrine, courts can thus immunize from potential federal antitrust liability certain activity undertaken pursuant to a state regulatory regime or other state law.[42] State sovereignty and federalism were, and still are, the underpinnings of Supreme Court state action jurisprudence.[43]

The state action doctrine applies not only to state governmental actors themselves, but also, in certain circumstances, to quasi-governmental entities and private actors. The actions of state governmental actors are generally immune from antitrust liability without further inquiry.[44] This is because "[w]hen the conduct is that of the sovereign itself . . . the danger of unauthorized restraint of trade does not arise."[45] What constitutes the "state," however, has given rise to extensive litigation. For example, cities and other municipalities, public service commissions, and state regulatory boards are not the "state" for purposes of the state action doctrine.[46]

The actions of private economic actors, as well as of governmental or quasi-governmental entities not considered to be the "state," are immune from antitrust liability only if they pass a two-part test. The Supreme Court set forth that test in *California Retail Liquor Dealers Ass'n v. Midcal Aluminum, Inc.*: (1) the challenged restraint must be "'one clearly articulated and affirmatively expressed as state policy,'" and (2) "the policy must be 'actively supervised' by the State itself."[47] The first requirement, "clear articulation," serves to ensure that the state has affirmatively authorized departures from free-market competition.[48] The second requirement, "active supervision," is intended to ensure that state action immunity "will shelter only the particular anticompetitive acts of private parties that, in the judgment of the State, actually further state regulatory policies."[49] The Supreme Court's state action jurisprudence has thus recognized the importance of not immunizing conduct intended to benefit private, not governmental, purposes.

Critics warn, however, that the lower courts increasingly have applied the *Midcal* test in ways that allow defendants to obtain antitrust immunity in situations where a state did not intend to displace competition. Others question whether courts have properly taken into account the potential for one state's endorsement of anticompetitive conduct to have spillover effects that raise prices or otherwise harm consumers in other states. And there is also a serious question whether the state action doctrine should immunize conduct by state government entities and municipalities when they act as market participants.

The American Bar Association, Section of Antitrust Law (ABA Antitrust Section) believes that "[s]tate action immunity drives a large hole in the framework of the nation's competition laws."[50] In 2003 the Federal Trade Commission (FTC) issued a staff report (FTC State Action Report) recommending "clarification and re-affirmation of the original purposes of the state action doctrine to help ensure that robust competition continues to protect consumers."[51]

2. Summary of Recommendations

The Commission agrees that the federal lower courts in some cases have misinterpreted or misapplied the state action doctrine to override the federal policy in favor of free-market competition in ways inconsistent with Supreme Court rulings. The best method to resolve concerns with the state action doctrine is through the continued development of case law in the courts. The Supreme Court's articulation of core standards for the state action doctrine will lead to its correct application if applied more rigorously by the lower courts. There is no need at this time to codify those standards. Rather, the lower courts need to apply the Supreme Court's precedents with increased precision. The courts should do this with the understanding that failure to do so could result in significant consumer harm from anticompetitive conduct that has been immunized from antitrust scrutiny.

Based on its study, the Commission makes the following recommendations, which are explained more extensively in Part 4 of this Section.

75. Congress should not codify the state action doctrine. Rather, the courts should apply the state action doctrine more precisely and with greater attention to both Supreme Court precedents and possible consumer harm from immunized conduct.

76. The courts should not grant antitrust immunity under the state action doctrine to entities that are not sovereign states unless (1) they are acting pursuant to a clearly articulated state policy deliberately intended to displace competition in the manner at issue, and (2) the state provides supervision sufficient to ensure that the conduct is not the result of private actors pursuing their private interests, rather than state policy.

The lower courts have not always properly implemented Supreme Court precedents outlining what is required to satisfy the clear articulation prong. In *Town of Hallie v. City of Eau Claire* the Supreme Court held the clear articulation standard was satisfied where the allegedly anticompetitive conduct was a "foreseeable result" of a state law.[52] Following *Town of Hallie*, however, some courts have applied a standard of "foreseeability" (and thus immunity) wherever a state authorizes conduct that does not necessarily, but might, have an anticompetitive effect.[53] To say that anticompetitive effects are a possible result of a statute, however, is not the same as finding "a deliberate and intended state policy" to replace competition with regulation, as the Court subsequently required in *FTC v. Ticor Title Insurance Co.*[54]

Another issue that demands rigorous attention is whether the relevant statute reveals a state's intent to displace competition *in the manner at issue* in the case. The Seventh Circuit's reasoning in *Hardy v. City Optical, Inc.* exemplifies the type of careful analysis that courts should use.[55] In that case, a statute required optometrists to provide patients with some, but not all, of the information needed to purchase contact lenses, which left patients unable to purchase their lenses through cheaper, mail-order sources. The court held that "Indiana has not sought to supplant . . . competition *from mail-order houses*," and therefore the clear articulation standard was not met.[56] This approach ensures that the courts do not loosely allow exceptions to competition. The Commission therefore makes the following recommendation.

77. As proposed in the FTC State Action Report, the courts should reaffirm a clear articulation standard that focuses on two questions: (1) whether the conduct at issue has been authorized by the state, and (2) whether the state has deliberately adopted a policy to displace competition in the manner at issue.

The active supervision requirement ensures that "'the [private] actor is engaging in the challenged conduct pursuant to state policy,' rather than in pursuit of private interests."[57] Because the active supervision test applies only when there is a risk that the challenged conduct may be the product of parties' pursuing interests other than state policy, its application turns in part on whether the relevant actor is public or private.[58] The Supreme Court's one opinion in this area, *Ticor*, dealt with a situation in which state supervision of the conduct at issue was virtually nonexistent.[59] Thus, the Court has not yet provided extensive guidance on how to address more complex situations.

To focus the active supervision inquiry, courts should use a flexible, "tiered" approach that requires a different level of active supervision depending on the type of conduct at issue, the entity engaging in that conduct, the industry, the regulatory scheme, and other factors.[60] A flexible analysis would recognize that, to the extent the actor or the challenged conduct suggests an appreciable risk that the challenged conduct results from private actors pursuing their private interests, rather than state policy, courts should require a greater degree of active supervision than if that risk is lower. The Commission therefore makes the following recommendation.

78. The courts should adopt a flexible approach to the active supervision prong, with different requirements based on the situation.*

The state action doctrine has been criticized for its failure to consider interstate spillovers.[61] When one state regulates activities in a manner that overwhelmingly imposes the cost of regulation on citizens of other states, both economic efficiency and the political participation goals of the federal system suffer. State regulations producing spillover costs to consumers in other states do not deserve deference.[62] Out-of-state citizens adversely affected by spillovers typically have no political participation rights and effectively are disenfranchised on whether the conduct at issue should be authorized by the neighboring state.[63] Moreover, economics teaches that where decision-makers reap the benefits without bearing the costs of an activity, they have incentives to engage in more of that activity than is socially desirable.[64] To address the significant consumer harm and political representation concerns, the Commission makes the following recommendation.

79. Where the effects of potentially immunized conduct are not predominantly intrastate, courts should not apply the state action doctrine.†

* Commissioners Garza, Kempf, and Warden do not join this recommendation.

† Commissioners Burchfield, Cannon, Delrahim, Garza, and Kempf do not join this recommendation.

A government entity's participation in a market as a competitor is likely to have market-distorting effects if that entity is not subject to the same rules of competition as private competitors. A "market participant" exception to the state action doctrine would require application of both prongs of the *Midcal* test to a government entity participating in the market. This would ensure that the government entity's behavior is consistent with state policy and the state action doctrine is applied consonant with its original purposes and goals. The possibility of such an exception was recognized by the Supreme Court in *City of Columbia v. Omni Outdoor Advertising, Inc.*, where the majority stated in dictum that the *Parker* doctrine "does not necessarily obtain where the State acts not in a regulatory capacity but as a commercial participant in a given market."[65] The Commission therefore makes the following recommendation.

80. When government entities act as market participants, the courts should apply the same test for application of the state action doctrine to them as the courts apply to private parties seeking immunity under the state action doctrine.*

2. STATUTORY EXEMPTIONS FROM THE ANTITRUST LAWS

A. Introduction

As discussed in Part 1.A, above, statutory antitrust exemptions should be disfavored as likely to harm both U.S. consumers and the U.S. economy.[66] A wide variety of antitrust exemptions, both partial and whole, currently exists in federal law, as listed in Annex A. Rather than examine each antitrust exemption individually, the Commission concluded that articulating relevant general principles that Congress may wish to use in determining whether to abolish, renew, or adopt particular antitrust exemptions would be its best contribution. The Commission's recommendations are discussed in more detail below.

* Commissioners Burchfield, Garza, and Kempf do not join this recommendation.

B. Background

1. History of and Justifications for Antitrust Exemptions

"[V]igorous competition, protected by the antitrust laws, does the best job of promoting consumer welfare and a vibrant, growing economy."[67] Nonetheless, in response to concerns about particular societal values, Congress has at times exempted certain groups or activities from the full or partial application of the antitrust laws.[68] Exemptions from the antitrust laws have existed since the passage of the Clayton Act in 1914.[69] Most recently, Congress passed the medical resident matching program exemption in 2004, which immunizes sponsoring, conducting, or participating in a graduate medical education residency matching program.[70] Congress, of course, is entitled to make judgments about the extent to which competition is in the public interest and when other societal values trump the aims of antitrust law.[71]

The creation of antitrust exemptions is made easier by the disparity in the nature of the benefits they create and the costs they impose.[72] While the benefits of exemptions generally flow to small, concentrated interest groups, the costs are typically passed on to a large population of consumers through higher prices, reduced output, lower quality, and reduced innovation.[73] The concentrated benefits provide incentives for interested parties to seek immunities from Congress, while the diffuse costs often have sufficiently minimal impact on individual consumers that those consumers are unlikely to oppose the creation of immunities.[74]

2. Examples of Different Kinds of Antitrust Exemptions

Congress has adopted varying types of antitrust exemptions; most are unique. Among other things, these exemptions differ in terms of the scope of conduct exempted from antitrust law and whether some degree of potential antitrust liability remains (for example, single damages or the possibility of injunctive relief). Attempts at categorizing them are difficult and often unhelpful. Indeed, regardless of their nature, exemptions are harmful. Nonetheless, to describe the problem of exemptions without a description of specific immunities would fail to convey their pernicious nature.

Some exemptions provide a limited immunity for specific conduct. Examples include the Health Care Quality Improvement Act, which provides limited immunity from antitrust damages (but not from equitable relief) for physicians participating in professional peer review bodies in which they review other physicians' conduct;[75] and the Standards Development Organization Advancement Act, which provides for rule of reason assessment and limits antitrust damages to actual damages for certain kinds of standards development organizations that form joint ventures or engage in standards development activities.[76] Another example is Title III of the Export Trading Company Act of 1982, which allows any person engaged in export trade to request a Certificate of Review from the Department of Commerce, conferring immunity from criminal antitrust actions as well as treble damages in civil antitrust actions for activities specified in the Certificate, so long as the applicant establishes that its export trade and methods of operation will not adversely affect competition in the United States.[77] The Webb-Pomerene Act similarly provides an exemption to Sherman Act provisions for associations formed solely to engage in export trade, on the condition that the association is not adversely affecting competition in the United States.[78]

Other exemptions apply to narrow areas but provide a broader immunity—often complete immunity from the antitrust laws. Examples include antitrust immunity for marketing alliances between domestic and foreign airlines that are approved by the Department of Transportation;[79] the Charitable Donation Antitrust Immunity Act, which gives antitrust immunity to charitable institutions that set the annuity rate for gift annuities or charitable remainder trust agreements;[80] the Defense Production Act, which provides antitrust immunity for conduct undertaken in developing or carrying out a voluntary agreement or plan of action for the President that is necessary for the defense of the United States;[81] the Need-Based Educational Aid Act, which provides an antitrust exemption to certain joint actions taken by institutions of higher education regarding awards of financial aid to students;[82] and the Soft Drink Interbrand Competition Act, which provides an antitrust exemption for the grant of exclusive territories to soft-drink bottlers by soft-drink trademark holders in trademark licensing agreements.[83]

Exemptions may instead apply broadly, but provide only limited immunity (from multiple damages, for example). Examples include the Local Government Antitrust Act (LGAA), which precludes treble damages actions against local governments, their officers and employees acting in an official capacity, or private persons whose conduct is directed by a local government;[84] and the National Cooperative Research and Production Act (NCRPA), which provides for rule of reason assessment and limits antitrust damages to actual damages for joint ventures for the purpose(s) of research, development, or production (except for certain specified conduct), if the joint venture has first been notified to the Antitrust Division of the Department of Justice (DOJ) and the FTC.[85]

Finally, some exemptions create a broad immunity for entire areas or types of commerce. For example, the Capper-Volstead Act provides antitrust immunity for persons engaged in the production of agricultural products acting together in associations to process, prepare, handle, or market such products, unless the conduct would violate Section 2 of the Sherman Act or "unduly enhance" prices of agricultural products.[86] The McCarran-Ferguson Act grants an exemption to "the business of insurance" to the extent it is regulated by state law, unless the conduct involves an agreement or act to "boycott, coerce, [or] intimidat[e]."[87] The statutory labor exemption "enables workers to organize to eliminate competition among themselves, and to pursue their legitimate labor interests, so long as they do not combine with a nonlabor group."[88] The Shipping Act exempts a wide variety of agreements filed with the Federal Maritime Commission, including those in which shipping "conferences"—that is, groups of competing ocean liner shipping companies—formally agree to specific terms of service, including fixing rates.[89]

C. Recommendations and Findings

57. **Statutory immunities from the antitrust laws should be disfavored. They should be granted rarely, and only where, and for so long as, a clear case has been made that the conduct in question would subject the actors to antitrust liability *and* is necessary to satisfy a specific societal goal that trumps the benefit of a free market to consumers and the U.S. economy in general.**

58. **In evaluating the need for existing or new immunities, Congress should consider the following:**

- **Whether the conduct to which the immunity applies, or would apply, could subject actors to antitrust liability;**
- **The likely adverse impact of the existing or proposed immunity on consumer welfare; and**
- **Whether a particular societal goal trumps the goal of consumer welfare, which is achieved through competition.**

Congress should first determine whether the conduct covered, or to be covered, by an antitrust exemption could in fact violate the antitrust laws. If not, immunity from the antitrust laws is unnecessary. This step is especially important given the changes in the antitrust laws over the past thirty to forty years. As discussed in Chapter I.A, the substantive application of the antitrust laws has become more economically sophisticated and flexible. Conduct that may have been at risk for the application of per se rules of automatic illegality at the time an antitrust exemption was adopted may now be far more likely to be evaluated under the rule of reason, which examines likely procompetitive, as well as anticompetitive, effects.

Congress should also carefully weigh the harms of an antitrust exemption to consumer welfare.[90] Any decision to allow an exemption should "be made reluctantly and only after thorough consideration of each particular situation."[91] A proposed exemption should be recognized as a decision to sacrifice competition and consumer welfare, and should be allowed only if Congress determines that a substantial and significant countervailing societal value outweighs the presumption in favor of competition and the widespread benefits it provides.[92]

Congress, of course, is entitled to make judgments regarding what societal values may trump the goals of antitrust law. The Commission finds two arguments in favor of antitrust exemptions particularly unpersuasive, however. First, no immunity should be granted to create increased certainty in the form of freedom from antitrust compliance and litigation risk.[93] Antitrust compliance and litigation risks are costs of doing business that hundreds of thousands of American businesses manage every day. No particular companies or industries should be specially entitled to avoid those costs; if these costs are unreasonable, broader reform applicable to all businesses is the proper remedy.* Second, no immunity should be granted to stabilize prices in order to provide an industry with certainty and predictability for purposes of investment or solvency.[94] This too is a benefit that all industries would appreciate, but that none should be singled out to receive. The costs of price "stability" typically flow to consumers and result in inflexibility that undermines economic growth. Indeed, these were two of the justifications offered in support of the three exemptions on which the Commission held hearings.

For example, some proponents of the McCarran-Ferguson Act's antitrust exemption for the business of insurance maintain the exemption is necessary to allow insurers, among other things, to collect, aggregate, and review data on losses (both historical and projected) so they can better set their rates to cover their likely costs.[95] They argue that the sharing of such historical and trending data is needed especially by smaller insurers that otherwise would be unable reasonably to assess risk and compete effectively.[96] Like all potentially beneficial competitor collaboration generally, however, such data sharing would be assessed by antitrust enforcers and the courts under a rule of reason analysis that would fully consider the potential procompetitive effects of such conduct and condemn it only if, on balance, it was anticompetitive.[97] Insurance companies would bear no greater risk than companies in other industries engaged in data sharing and other collaborative undertakings. To the extent that insurance companies engage in anticompetitive collusion, however, then they appropriately would be subject to antitrust liability.

A related and equally questionable justification appears in support of the antitrust exemption under the Shipping Act. Although Congress substantially modified the Shipping Act in 1998 to allow individually negotiated rates, which has sharply reduced ocean carriers' use of jointly set "conference rates,"[98] proponents assert that an antitrust exemption remains necessary for other purposes. They maintain that carriers need an antitrust exemption to adopt more efficient practices jointly, such as agreements that allow ocean carriers to share certain equipment at ports in order to reduce congestion.[99] Acknowledging the possibility that such agreements could withstand antitrust scrutiny, one witness maintained that the ocean carriers nevertheless would not attempt them absent the certainty that no antitrust liability would result.[100] The witness emphasized the enormous investments of ocean carriers and the need to eliminate even the potential for antitrust liability.[101]

However, this reasoning reduces to an argument that ocean carriers should not be subject to the same costs of doing business as other industries. These costs of doing business

---

* Although Commissioner Burchfield agrees that increased certainty and freedom from litigation risk are not justifications for antitrust immunity, he believes that programs by federal and state governments to review business practices in advance of their implementation to confirm the legality of those practices under existing antitrust standards are useful, but currently underused, and should be encouraged.

include managing firms' conduct to comply with antitrust, and many other, laws. All kinds of businesses across the United States—including firms that make investments comparable to or greater than those of ocean carriers—comply with the antitrust laws as they plan their activities, including joint activities with competitors. This is not hypothetical economic theory;[102] it is how hundreds of thousands of firms do business every day. Because they must comply with the antitrust laws, these firms structure their activities to avoid anticompetitive effects.[103] This promotes consumer welfare. There does not appear to be anything unique about ocean carriers that would merit holding them to a lesser standard.

Indeed, contrary to the asserted need for an immunity, ocean shipping provides a good example of an industry that now operates more efficiently with competition than without. An exhaustive survey of ocean shipping has found that:

> [t]he steepest declines in observed freight rates have coincided with a generalised decrease in conference power in the face of competition from strong independent operators and the implementation of competition-enhancing legislation in the United States trades . . . . Carriers have delivered better quality and more shipper-responsive services in recent years. This improvement in shipping services has not come about because of price fixing, but, rather, has accompanied a decline in conference power and an increase in competition.[104]

These justifications are similarly wanting with respect to the Export Trading Company Act (ETC Act).[105] Title III of the ETC Act creates a limited antitrust exemption for U.S. companies that jointly export goods or services, provided there is no substantial lessening of competition within the United States. Such joint export-oriented activities are not subject to criminal antitrust liability or treble damages.[106] The ETC Act creates a rebuttable presumption that U.S. antitrust laws are not violated by a covered company's joint conduct to export with other firms as long as it complies with an Export Trade Certificate of Review issued by the Commerce Department (and reviewed by the DOJ).[107]

Proponents of the ETC Act claim that it promotes exports, especially by small and medium-sized companies that "would not be able to export, or not be able to export on a sustained basis" without an antitrust exemption for their joint conduct.[108] Small and medium-sized enterprises constitute the vast majority of companies covered by Certificates of Review.[109] Proponents argue that the ETC Act exemption is necessary for these companies because it provides assurance that specified conduct does not violate the U.S. antitrust laws and will not result in a government antitrust action against the exporters.[110]

The Commission sees no reason, however, why these companies should be held to a lesser standard of antitrust compliance than any other companies doing business. The Department of Commerce explained that the ETC Act does not actually exempt conduct from the antitrust laws because a Certificate would not issue covering conduct that would violate those laws.[111] In that case no antitrust exemption should be necessary.

The ETC Act raises a particularly acute concern insofar as it can be characterized as granting a limited immunity to U.S. companies engaging in cartel behavior in foreign markets. It is inconsistent for U.S. antitrust enforcers to emphasize to foreign antitrust enforcers the importance of cartel enforcement at the same time that U.S. law immunizes what some consider to constitute overseas cartel behavior by American firms.*

These are only three of more than thirty antitrust exemptions. The Commission does not mean to imply that these three are the only antitrust exemptions that warrant scrutiny, however. Although the Commission was not in a position to study all antitrust exemptions in depth, it heard no compelling justification for any of the exemptions on which it held hearings.[112] Such justifications, as discussed above, seemed to overestimate the potential for antitrust liability for the immunized conduct or seek a special exception from the same costs of legal compliance as are borne by other firms in the United States. Claimed justifications for antitrust exemptions require careful scrutiny and testing against legal and marketplace realities.

59. The following steps are important to assist Congress in its consideration of those factors:

- **Create a full public record on any existing or proposed immunity under consideration by Congress.**
- **Consult with the Federal Trade Commission and the Antitrust Division of the Department of Justice about whether the conduct at issue could subject the actors to antitrust liability and the likely competitive effects of the existing or proposed immunity.**
- **Require proponents of an immunity to submit evidence showing that consumer welfare, achieved through competition, has less value than the goal promoted by the immunity, and the immunity is the least restrictive means to achieve that goal.**

* Commissioners Burchfield and Garza do not join the Commission's conclusions with respect to the ETC Act.

Commissioner Burchfield believes that the certainty provided to small exporters by the ETC Act is worthwhile. Furthermore, he would not suggest that the ETC Act is deserving of special criticism among all the other exemptions.

In Commissioner Garza's view, the ETC Act has not been shown to have had anticompetitive effects. It is also consistent with a proposal she favors to limit treble damage exposure for overt conduct subject to the rule of reason. It is also erroneous, in her view, to equate joint export activity by small and medium-sized companies with criminal "cartels," especially given that a Certificate of Review will not be issued over the objection of the Justice Department.

Congress should develop a complete public record when it considers whether to abolish, renew, or enact antitrust exemptions.[113] Gathering information from a broad range of sources and through various means, including public hearings, is vital for sound policy and well-reasoned decision-making.[114] Ensuring that the information gathered is available to all interested persons enables identification of any errors or omissions in the record, facilitates more input to Congress, and provides context regarding the purpose and scope of the immunity at issue.[115] Moreover, providing a substantial legislative history that explains the reasons for a particular exemption can provide a baseline against which to compare assumptions and conditions at the time of passage with data obtained at a later time when the immunity may once again be under consideration.[116]

Congress should consult with the antitrust agencies on whether the conduct at issue could subject the actors to antitrust liability and the competitive effects of the immunity.[117] The agencies already informally provide their views on proposed immunities and do so formally when called upon.[118]

Further, Congress should require proponents of an immunity to submit evidence demonstrating that the benefits of competition are less important than the societal value promoted by the immunity under consideration, and that the proposed immunity is the least restrictive means to achieve that value.[119] The proponent of an antitrust exemption should explain why conduct within the scope of a proposed immunity is both in the public interest and unlawful under the antitrust laws; estimate the ancillary effects of the proposed immunity; and demonstrate that the immunity is essential to achieve the desired policy outcome.[120] This would require the proponent to show there is no less restrictive alternative to achieve the benefits of the exemption.[121]

The burden of justifying any immunity should fall on the proponents of that immunity, because they "are in an inherently unique position to provide that information as to the relative merits of the immunity."[122] Exemptions from the antitrust laws should require ongoing proof of their justification and necessity.[123]

60. If Congress determines that a particular societal goal may trump the benefit of a free market to consumers and the U.S. economy in general, Congress should take the following steps:

- **Consider a limited form of immunity—for example, limiting the type of conduct to which the immunity applies and limiting the extent of the immunity (for example, a limit on damages to actual, rather than treble, damages).**

- **Adopt a sunset provision pursuant to which the immunity or exemption would terminate at the end of some period of time, unless specifically renewed.**

- **Adopt a requirement that the Federal Trade Commission, in consultation with the Antitrust Division of the Department of Justice, report to Congress, before any vote on renewal, on whether the conduct at issue could subject the actors to antitrust liability and the likely competitive effects of the immunity proposed for renewal.**

Limited Form of Immunity. If Congress decides an antitrust exemption may be an appropriate course of action, it first should consider precisely what conduct may require an antitrust exemption. The scope of conduct to be immunized should be as limited as possible. In addition, Congress should consider whether full immunity from antitrust liability is necessary to achieve the societal value at issue. It may be sufficient instead to limit potential civil antitrust remedies.[124] An antitrust exemption that reduces treble damages to single damages is preferable to a broader exemption that would more significantly restrict the ability of the antitrust laws to combat anticompetitive behavior.[125] Two examples of such an approach are the NCRPA and the Standards Development Organization Advancement Act, both of which restrict monetary remedies to actual damages for conduct taken in accordance with the acts' terms.[126]

Sunset Provision. Congress also should consider a "sunset" provision for any antitrust exemption it adopts or reconsiders. Sunset provisions would allow Congress to take into account changed circumstances that may make an immunity socially harmful.[127] They help ensure that immunity-granting legislation is interpreted in accordance with congressional intent.[128] Sunset provisions allow Congress to restudy an issue regularly, leading to more frequent input from interested groups.[129] To date, sunset provisions have been used only very rarely for antitrust exemptions.[130] Once an exemption is adopted, it is rarely revisited. Especially when vested interests are at stake, it is often difficult to get renewed consideration of the need for an antitrust exemption, even if it proves ineffective or harmful.

Periodic consideration of exemptions is important. Statutory exemptions can cement the economic understanding of market circumstances at a particular point in time. The justifications claimed for statutory exemptions from the antitrust laws warrant a great deal of skepticism, particularly if the exemption was originally created decades ago. Changes in technology, competitive forces, or economic learning can render an exemption completely obsolete.[131] Many were enacted at a time when the U.S. economy was very different from today. Moreover, revolutions in communications, transportation, and business methods have lowered transactions costs and substantially changed the ways in which firms and industries operate.[132] International competition now affects many more industries than previously was the case. Antitrust analysis itself has changed substantially in recent decades. Thus, even if one assumes there may have been valid economic justifications for specific industry exemptions in the past, it is highly questionable whether those justifications remain valid.[133]

To prevent the retention of antitrust exemptions for decades after their reasons for being have disappeared, Congress should impose a sunset provision on all immunities it enacts.[134] The Commission does not intend this recommendation to encourage the adoption of antitrust exemptions on the rationale that they can be reconsidered at a later time.[135] Rather, if Congress goes so far as to adopt or renew an antitrust exemption, it is important to ensure it does not become set in stone, but rather must be justified on a recurring basis. Existing immunities also should be amended to include sunset provisions and should be reviewed using the framework proposed by this Commission.

The mechanics of this approach would require all statutorily created antitrust immunities to terminate after a set period of time, unless specifically renewed by an affirmative act of Congress after thorough reconsideration of the justification for and the evaluation of the actual operation of the exemption.[136] Congress can then determine whether to initiate a renewal process. Prior to the expiration of the sunset period, policymakers should hold public hearings regarding possible renewal of the immunity.[137] In addition to examining the historical record of an immunity, policymakers should collect new information that was not available previously but could be relevant to their current analysis of that immunity. Key issues would include: (1) whether economic or legal conditions have changed such that an immunity no longer is necessary; (2) whether alternatives could remedy the alleged problem with less impact on competition; and (3) what effects the immunity has had since its passage or last renewal.[138]

Report from FTC. Congress should require that, before any vote on renewal of an exemption, the FTC, in consultation with the DOJ, report to Congress on whether the conduct at issue could subject the actors to antitrust liability, and the competitive effects of the immunity proposed for renewal. FTC Chairman Deborah Platt Majoras testified that such studies of competitive effects are very resource-intensive, but that the FTC would consider undertaking such studies if given sufficient resources.[139] Another way to implement this recommendation could be to direct the FTC to sponsor studies undertaken by academics or others as appropriate.

61. Courts should construe all immunities and exemptions from the antitrust laws narrowly.

Congress should grant only those immunities that are narrowly drafted, so that competition is reduced only to the minimum extent necessary to achieve the intended goal.[140] Congress commonly puts limits on its exemptions,[141] and has at least once explicitly directed that a statutory exemption be construed narrowly.[142]

Further, courts should construe all immunities narrowly and against the beneficiary.[143] Doing so would restrict their more expansive interpretation and emphasize the importance of Congress's enacting clear statutory language.[144]

3. REGULATED INDUSTRIES, THE TRANSITION TO DEREGULATION, AND ANTITRUST LAW

A. Introduction

During the early part of the twentieth century, a variety of industries were considered subject to market failures, such as natural monopoly or an inability to survive "excessive competition." In such industries, Congress typically created administrative agencies to oversee economic functioning, particularly prices, costs, and entry (known as "economic regulation").[145] Regulation was intended to limit the exercise of monopoly power and advance the objective of reliable service, provided on non-discriminatory terms, through rate and service regulation.[146] Under such regulation, there is only a limited role for antitrust law.[147] Indeed, economic regulation ultimately can be the "antithesis" of competition, tending to preserve monopolies and other non-competitive market structures by restricting entry, controlling price, skewing investment, and limiting or delaying innovation.[148]

A movement toward deregulation, however, now has taken place in almost all regulated industries.[149] Various factors have moved public policy in the United States toward deregulation of formerly regulated industries.[150] Technological progress has facilitated the growth of competition in industries previously considered natural monopolies.[151] In addition, critiques of regulation began to emerge as early as 1960, when a significant report concluded that "most federal regulatory agencies ha[ve] taken sides with the regulated firms at the expense of the public interest," and that the costs of regulation were significantly more than anticipated.[152] Others expanded on these critiques, pointing out that regulation often distorts firms' incentives and rewards inefficiency rather than reduced costs and innovation.[153] Some conclude that, in many instances, "regulation reflects successful rent-seeking by private economic interests and generally reduces consumer welfare by restricting output."[154]

B. Recommendations and Findings

Congress's decision broadly to deregulate has brought substantial benefits to U.S. consumers and the U.S. economy.[155] The trend toward deregulation should be furthered where practicable. Free-market competition generally promotes efficiency and thus benefits consumer welfare, while economic regulation often results in inefficiency that increases prices to consumers. In the vast majority of cases, competition is more likely to benefit consumers than is economic regulation. The Commission therefore makes the following general recommendation, and several others set forth below.

62. Public policy should favor free-market competition over industry-specific regulation of prices, costs, and entry. Such economic regulation should be reserved for the relatively rare cases of market failure, such as the existence of natural monopoly characteristics in certain segments of an industry, or where economic regulation can address an important societal interest that competition cannot address. In general, Congress should be skeptical of claims that economic regulation can achieve an important societal interest that competition cannot achieve.

1. The Application of Antitrust Law in Regulated and Deregulated Industries

When and how to apply antitrust law in the context of regulated industries and industries undergoing deregulation has prompted confusion from time to time. Even in industries governed predominantly by regulation, antitrust can still play a limited role.[156] At the other end of the spectrum, once deregulation has been completed and the public relies solely on competition and market forces, the antitrust laws should apply fully to deter or challenge anticompetitive conduct.

63. When the government decides to adopt economic regulation, antitrust law should continue to apply to the maximum extent possible, consistent with that regulatory scheme. In particular, antitrust should apply wherever regulation relies on the presence of competition or the operation of market forces to achieve competitive goals.

The precise point at which an industry passes from regulation to competition requiring antitrust enforcement typically is not easy to discern. The deregulation of entire industries cannot always be instantaneous, of course, so transition mechanisms may be necessary.[157] In addition, certain segments of industries may require ongoing regulation if natural monopoly characteristics remain that hinder effective competition there.[158] Thus, questions have arisen about whether antitrust law should apply to regulated industries, particularly those undergoing transition from regulation to deregulation.

In many industries that have undergone deregulation, policymakers have found particular circumstances in which monopolistic market structures and residual areas of potential monopoly power, often called "bottlenecks," continue to require some form of regulation.[159] In these circumstances, it is crucial to apply sound economic principles so that regulated and unregulated portions of industry do not work at cross-purposes and thereby harm consumer welfare.[160] One authority on deregulation stated:

> Where competition is not feasible throughout an industry or market, as in the traditional public utilities, entry of unregulated competition can introduce distortions so severe as to make the mixed system the worst of both possible worlds. The preferable remedy is not to suppress the competition, but to make the residual regulation as consistent as possible with it.[161]

As Congress continues to assess ongoing regulation and deregulation in particular industries, it is important to keep in mind that the application of antitrust law is a necessary component of a reliance on competition. Antitrust law generally has a more significant role to play as an industry moves toward less direct regulation.[162] "In essence, [the antitrust laws] promote competition so that competition itself can bring us its economic benefits."[163]

This general principle has a number of applications, two of which are explained below.

a. Savings Clauses and Implied Immunities

64. Statutory regulatory regimes should clearly state whether and to what extent Congress intended to displace the antitrust laws, if at all.*

65. Courts should interpret savings clauses to give deference to the antitrust laws, and ensure that congressional intent is advanced in such cases by giving the antitrust laws full effect.†

Congress can specify the extent to which antitrust law should apply to regulated industries by including savings clauses in legislation involving those industries. Antitrust savings clauses clarify the extent to which Congress intends to preserve the role of antitrust enforcement in a regulatory environment.[164] They make clear that Congress did not intend the courts to imply immunity from the antitrust laws for conduct covered by a regulatory regime.[165] Where a savings clause does not exist, the courts must "discern the intent behind complex statutes and regulatory schemes, and fill in the gaps" of such legislation.[166] This may result in outcomes not intended by Congress.

Congress should articulate clearly the extent to which it intends a regulatory regime to displace the antitrust laws, if at all. A savings clause that addresses this issue can help courts determine whether an immunity from antitrust law should be implied from the regulatory scheme, which can reduce uncertainty and litigation costs. The use of savings claus-

* Commissioner Warden does not join this recommendation. In his view, this and the following recommendation do not recognize the myriad of conflicts between regulatory and antitrust regimes that arise in the real world and are unforeseen when regulatory statutes are enacted.

† Commissioners Garza and Warden do not join this recommendation.

Commissioner Warden does not join this recommendation for the reason stated in the previous note.

es can help avoid results that conflict with Congress's intent in creating the regulatory scheme.

66. Courts should continue to apply current legal standards in determining when an immunity from the antitrust laws should be implied, creating implied immunities only when there is a clear repugnancy between the antitrust law and the regulatory scheme at issue, as stated in cases such as *National Gerimedical Hospital and Gerontology Center v. Blue Cross of Kansas City*.*

In the absence of a savings clause, courts will determine whether the regulatory scheme is so pervasive that Congress is "assumed to have foresworn the paradigm of competition."[167] The analysis of implied immunities begins with the "cardinal principle of construction that repeals by implication are not favored."[168] This principle reflects a presumption that Congress does not intend to limit the scope of the antitrust laws except where it expressly says so.

As the Supreme Court explained in *National Gerimedical Hospital and Gerontology Center v. Blue Cross of Kansas City*, "[i]mplied antitrust immunity . . . can be justified only by a convincing showing of clear repugnancy between the antitrust laws and the regulatory system."[169] The Court further stated that "[r]epeal is to be regarded as implied only if necessary to make the [subsequent regulatory scheme] work, and even then only to the minimum extent necessary. This is the guiding principle to reconciliation of the [antitrust and regulatory] statutory schemes."[170] In fact, "[e]ven when an industry is regulated substantially, this does not necessarily evidence an intent to repeal the antitrust laws with respect to every action taken within the industry."[171] An implied immunity is limited to the particular activity challenged and does not extend to other conduct regulated by the same agency."[172] Although the Supreme Court is likely to address this standard in *Billing v. Credit Suisse First Boston Ltd.* this term,[173] the Commission agrees that *National Gerimedical* provides the proper standard for determining whether to imply an immunity from antitrust law.

67. *Verizon Communications, Inc. v. Law Offices of Curtis V. Trinko LLP* is best understood only as a limit on refusal-to-deal claims under Section 2 of the Sherman Act; it does not displace the role of the antitrust laws in regulated industries.

* Commissioner Delrahim does not join this recommendation.

The appropriate application of antitrust savings clauses and when to imply an immunity from the antitrust laws was most recently raised by the Supreme Court's decision in *Verizon Communications, Inc. v. Law Offices of Curtis V. Trinko LLP*, involving the Telecommunications Act of 1996 (1996 Act).[174] In that case Trinko alleged that Verizon violated Section 2 of the Sherman Act by breaching certain interconnection duties under the 1996 Act.[175] Trinko was a customer of AT&T's local telephone service and allegedly suffered antitrust injury when he received "poor local phone service" due to Verizon's failure to fulfill its statutory duty to provide certain services to AT&T.[176]

When Congress enacted the 1996 Act, it permitted companies providing local telephone service to provide long-distance service as well, if they fulfilled certain duties to enable competitors to enter the local telephone service market.[177] To facilitate this new competition in the local telephone service market, local telephone companies (such as Verizon) were required to provide competitors (such as long-distance companies like AT&T) non-discriminatory access to certain network elements necessary to provide local telecommunication service.[178] Verizon agreed to abide by these new duties in order to enter the long-distance telephone service market.[179] When Verizon allegedly did not comply with its statutory duties under the 1996 Act, federal and state regulators penalized Verizon.[180] The New York state regulator issued orders requiring Verizon to pay $10 million to its injured competitors, and pursuant to a Federal Communications Commission (FCC) consent decree, Verizon agreed to pay $3 million to the U.S. Treasury.[181]

The question before the Supreme Court was "whether a complaint alleging breach of the incumbent's duty under the 1996 Act to share its network with competitors states a claim under § 2 of the Sherman Act."[182] The Court held that the Act's antitrust savings clause precluded the courts from implying immunity from the antitrust laws.[183] In applying the antitrust laws, however, the Court concluded that Verizon's alleged violations of the 1996 Act did not constitute a violation of the Sherman Act.[184] The Court concluded that "traditional antitrust principles" do not justify adding "insufficient assistance in the provision of service to rivals" under the 1996 Act to "the few existing exceptions from the proposition that there is no duty to aid competitors."[185] Thus, the Court's statements indicate that its holding simply confirms the limits on the circumstances that can give rise to a duty to deal under Section 2.

To be sure, there is language in the case that some have construed as suggesting that the Court failed to apply the antitrust laws fully because the alleged refusal to deal arose in the context of the regulatory regime established by the 1996 Act. Thus, they suggest, despite the savings clause, the Court created an implied immunity. For example, in part four of its decision, the Court opined that it must consider the importance of the "existence of a regulatory structure designed to deter and remedy anticompetitive harm" when evaluating antitrust claims.[186] This language must be read in the proper context, however. After deciding that Trinko's claim did not state a cause of action under traditional antitrust law, the Court then examined whether the regulatory regime established by the 1996 Act provided a reason to *expand* the contours of antitrust doctrine beyond the usual limits. The Court concluded it did not. The Court simply held that the specific, regulatory duties to deal established under the 1996 Act did not also create a new cause of action under the refusal-to-deal doctrine of Section 2 of the Sherman Act.[187] *Trinko* is thus best understood only as a limit on refusal-to-deal claims under Section 2 of the Sherman Act. It should not be read to displace the role of the antitrust laws in regulated industries as an implied immunity, nor should it be taken as a judicial rejection of a savings clause.

*b. Filed-Rate Doctrine (*Keogh *Doctrine)*

The filed-rate doctrine, also known as the *Keogh* doctrine,[188] prohibits a private plaintiff from pursuing an antitrust action seeking treble damages where the plaintiff is claiming that a rate submitted to, and approved by, a regulator resulted from an antitrust violation.[189] At the time this doctrine was created, members of a regulated industry were typically required to file their proposed rates with regulators who reviewed the rates to ensure they were "fair and reasonable." In creating the "filed rate" doctrine in *Keogh v. Chicago & Northwestern Railway*, the Supreme Court explained that only the relevant regulatory authority could change these rates, even if the rate was higher than it otherwise would be due to a price-fixing conspiracy.[190]

Since deregulation, however, many industry members are no longer required to file their rates with regulators. For example, rail and motor carriers are generally no longer required to file rates with the Surface Transportation Board (STB).[191] Similarly, in the electricity industry many rates are market-based and, although filed with a regulatory agency after they go into effect, are not reviewed for reasonableness.[192] Nonetheless, courts have continued to apply the filed-rate doctrine to preclude antitrust claims where a tariff has been filed with a regulatory agency, regardless of whether the agency has actually reviewed and approved the rate.[193]

68. Congress should evaluate whether the filed-rate doctrine should continue to apply in regulated industries and consider whether to overrule it legislatively where the regulatory agency no longer specifically reviews proposed rates.

Some commentators have questioned in recent years whether courts should continue to apply the filed-rate doctrine to market-based rates that are merely submitted to regulatory agencies as a formality and are not substantively reviewed.[194] In 1986 the Supreme Court reviewed the filed-rate doctrine and conceded that a variety of developments had cast the original reasoning for the *Keogh* doctrine "in a different light."[195] Nonetheless, the Court concluded, it was for Congress, not the Court, to determine whether to abolish the filed-rate doctrine.[196] The Commission believes the time has come for Congress to address the issue, especially since the movement to deregulation has continued, and even grown, since the Court's 1986 decision.

2. Merger Review in Regulated Industries

As discussed in Chapter I.B, the antitrust agencies examine mergers and acquisitions notified to the agencies pursuant to the HSR Act to determine whether a proposed transaction may substantially lessen competition.[197] The antitrust agencies apply the same merger analysis to all industries, including those that formerly were regulated.

Four industries remain in which a regulatory agency also has merger review authority: certain aspects of electricity (regulated by the Federal Energy Regulatory Commission (FERC)); telecommunications/media (regulated by the FCC); banking (regulated by various banking agencies); and railroads (regulated by the STB).[198] In those industries the regulatory authority typically reviews a proposed transaction under its statutory public interest standard. The "public interest" standard, which varies by industry, usually requires the agency to review both likely competitive effects and likely public interest effects. For example, in reviewing a proposed transaction, the FCC takes into account possible effects on the diversity of views available and the obligation to provide universal service, as well as likely effects on competition.[199] Thus, the regulatory authority could allow a transaction if it determines that the public interest benefits offered by the proposed transaction outweigh its likely anticompetitive effects.

In the first two of those four industries—electricity and telecommunications—the DOJ has full enforcement authority to investigate and challenge a proposed merger under the Clayton Act, regardless of the regulatory agency's authority pursuant to its regulatory statute.[200] In both instances, the regulatory agencies also consider competition as one part of their broader public interest review.[201]

A slightly different approach controls in the area of banking. There, the federal banking agency considers likely competitive effects, along with financial soundness and other banking-specific concerns.[202] The DOJ provides its competitive analysis to the banking agency, and, in practice, the banking agency and the DOJ usually work closely together to agree on the proposed transaction's likely competitive effects.[203] The banking agency has authority to depart from the DOJ's competition-based recommendations, however, and this has occurred a few times, although not in the recent past.[204] If the banking agency approves the merger over the DOJ's objections, the DOJ has full independent authority to challenge the banking agency's decision in court.[205] Pursuant to the Bank Merger Act, the court applies a standard that differs slightly from Section 7 of the Clayton Act: a merger can overcome an otherwise successful challenge on competition grounds if the merging parties demonstrate the anticompetitive effects are "clearly outweighed in the public interest by the probable effect of the transaction in meeting the convenience and needs of the community to be served."[206]

The fourth industry is railroads, where Congress, in abolishing the Interstate Commerce Commission (ICC) in 1995, transferred the ICC's historical railroad merger review authority to the STB.[207] The STB reviews mergers under a public interest standard that incorporates several considerations, including whether the proposed transaction would have an "adverse effect on competition."[208] By statute, the STB must give "substantial weight" to the DOJ's views on whether the transaction will adversely affect competition, but the STB makes the final decision on whether to allow the merger.[209] In 1996 the STB approved the merger between Union Pacific and Southern Pacific, despite the DOJ's objections that the merger was anticompetitive.[210] Unlike under the Bank Merger Act, the DOJ does not have independent authority to challenge a transaction in this industry.[211]

a. Statutory Authority to Review Mergers in Regulated Industries

69. Even in industries subject to economic regulation, the antitrust agencies generally should have full merger enforcement authority under the Clayton Act.*

70. For mergers in regulated industries, the relevant antitrust agency should perform the competition analysis. The relevant regulatory authority should not re-do the competition analysis of the antitrust agency.

71. The federal antitrust agencies and other regulatory agencies should consult on the effects of regulation on competition.

72. The antitrust enforcement agencies and courts should take account of the competitive characteristics of regulated industries, including the effects of regulation.

73. Mergers in regulated industries should be subject to the requirements of the Hart-Scott-Rodino Act, if they meet the tests for its applicability, or to an equivalent pre-merger notification and investigation procedure, such as set forth in the banking statutes, so that the relevant antitrust agency can conduct a timely and well-informed review of the proposed merger.

Merger review in industries still subject to some degree of regulation should place responsibility for the analysis of particular issues with the agency with the relevant expertise and should aim to make this dual review as efficient as possible. Merger review by two federal agencies can impose significant and duplicative costs on both the merging parties

* Commissioner Kempf does not join this recommendation.

While joining this recommendation, Commissioner Warden sees no reason to alter the present regime for review of bank mergers.

and the agencies. In addition, conflicts have sometimes arisen, for example as explained above when the STB approved a railroad merger despite a conclusion by the DOJ that it would substantially lessen competition.

The antitrust agencies have unique expertise in evaluating the likely competitive effects of mergers. Therefore, the antitrust agencies should be responsible for analysis of the likely competitive effects of mergers in regulated industries. The regulatory agencies have expert understanding of the regulated industry, as well as knowledge of the particular "public interest" factors important to the regulated industry, which can be valuable to the analysis. The antitrust agencies would draw on the expertise of the industry regulator in conducting its competition analysis, much as they do today in defense industry mergers and others. The recommended approach would ensure competition policy and enforcement consistency, limit inefficiencies and delays associated with overlapping enforcement, align competition policy assessments across industries regardless of the existence of different regulatory agencies, facilitate transparency in decision-making, and allow the antitrust agencies to act where they have a comparative advantage.[212] It would also limit duplicative expenditure of resources and an inefficient allocation of scarce government resources, particularly where an industry regulator disregards the antitrust agency's analysis.[213] Moreover, because the continued transition to deregulation may result in additional proposals to consolidate firms in regulated industries, it is important to conduct proper competitive analyses to ensure such industries continue to become, or remain, competitive.[214]

This recommendation is consistent with recommendations reached by other organizations studying the interrelationship between regulatory and antitrust review of mergers. The International Competition Policy Advisory Committee (ICPAC), which reviewed this issue in 2000, recommended giving federal antitrust agencies exclusive jurisdiction to review mergers in regulated industries, as well as further study of issues relating to overlapping agency review.[215] In offering this recommendation, the ICPAC majority explained that overlapping sectoral and generalized agency authority threatens (1) efficient review; (2) substantive international convergence; (3) case-by-case cooperation; and (4) consistency and transparency.[216] The Organisation for Economic Co-operation and Development (OECD) has also addressed the issue of the relationship between antitrust and sectoral agencies, most recently during its February 2005 Global Forum on Competition. The OECD concluded that competition agencies are best suited for competition oversight and that sectoral agencies are best suited for technical regulation.[217] This view was also supported by the Business and Industry Advisory Committee to the OECD.[218]

Finally, to ensure the ability of the antitrust agencies to perform proper competitive analyses, regulated industries should be subject to HSR Act requirements. This will ensure that the antitrust agency reviewing the transaction has appropriate information with which to perform its competitive analysis. Where there is an equivalent mechanism by which the antitrust agencies are provided with information, as is the case with banking mergers, such that requiring pre-merger notification under the HSR Act would be redundant, the Commission sees no need for duplicative filing requirements.

b. Ongoing Evaluation of the Need for Regulatory Review of Mergers

74. Congress should periodically review all instances in which a regulatory agency reviews proposed mergers or acquisitions under the agency's "public interest" standard to determine whether in fact such regulatory review is necessary.

- **In its reevaluation, Congress should consider whether particular, identified interests exist that an antitrust agency's review of the proposed transaction's likely competitive effects under Section 7 of the Clayton Act would not adequately protect. Such "particular, identified interests" would be interests other than those consumers interests—such as lower prices, higher quality, and desired product choices—served by maintaining competition.**

Congress should periodically revisit statutes providing for merger review by regulatory agencies to determine whether such review remains necessary. Economic theory and recent experience have shown that free-market competition will protect consumer interests such as price, quality, and choice of products. The Commission believes that competition can in many cases provide the same benefits to consumers that regulatory agencies' public interest review also seeks to ensure. Furthermore, the Commission is not convinced that an anticompetitive merger can ever be in the "public interest." Because of this, merger review by regulatory agencies may not be beneficial to consumer welfare.

4. THE STATE ACTION DOCTRINE

A. Introduction

The states, like the federal government, generally rely on competition in the marketplace to produce lower prices, higher quality, and innovation. Nonetheless, also like the federal government, sovereign states can enact economic regulations to replace competition in particular situations, and individual states have done so. Courts developed the "state action" doctrine to identify situations in which a state's decision to displace competition with regulation trumps the general federal policy in favor of free markets and, therefore, overrides the application of federal antitrust law. Under the state action doctrine, courts can immunize from potential federal antitrust liability certain activity undertaken pursuant to a state regulatory regime or other state law.[219]

The Supreme Court created the state action doctrine more than sixty years ago in *Parker v. Brown*.[220] There, the Supreme Court upheld the legality of a California program regulating the marketing of raisins, concluding that Congress did not intend the Sherman Act expressly to preempt state economic regulation.[221] Absent such an express statement, the Court was reluctant to assume Congress had implicitly preempted state law. The Court explained, "In a dual system of government in which, under the Constitution, the states are sovereign, save only as Congress may constitutionally subtract from their authority, an unexpressed purpose to nullify a state's control over its officers and agents is not lightly to be attributed to Congress."[222] State sovereignty and federalism were, and still are, the underpinnings of Supreme Court state action jurisprudence.[223]

The state action doctrine applies not only to state governmental actors themselves, but also, in certain circumstances, to quasi-governmental entities and private actors. The actions of state governmental actors are generally immune from antitrust liability without further inquiry.[224] This is because "[w]hen the conduct is that of the sovereign itself . . . the danger of unauthorized restraint of trade does not arise."[225] What constitutes the state, however, has given rise to extensive litigation. For example, cities and other municipalities, public service commissions, and state regulatory boards are not the "state" for purposes of the state action doctrine.[226]

The actions of private economic actors, as well as of governmental or quasi-governmental entities not considered to be the "state," are immune from antitrust liability only if they pass the two-part test set forth in *California Retail Liquor Dealers Ass'n v. Midcal Aluminum, Inc.*: (1) the challenged restraint must be "'one clearly articulated and affirmatively expressed as state policy,'" and (2) "the policy must be 'actively supervised' by the State itself."[227] The first requirement, that of clear articulation, serves to ensure that the state has affirmatively authorized departures from free-market competition.[228] The second requirement, that of active supervision, is intended to ensure that state action immunity "will shelter only the particular anticompetitive acts of private parties that, in the judgment of the State, actually further state regulatory policies."[229] In its most recent ruling on the state action doctrine, *FTC v. Ticor Title Insurance Co.*, the Supreme Court further explained the purpose of the active supervision inquiry is "not to determine whether the State has met some normative standard, such as efficiency, in its regulatory practices," but rather "to determine whether the State has exercised sufficient independent judgment and control so that the details of the rates or prices have been established as a product of deliberate state intervention, not simply by agreement among private parties."[230] Local governments can obtain full or partial antitrust immunity. To obtain full state action immunity, conduct by local governments must meet the "clear articulation," but not the "active supervision," portion of the *Midcal* test.[231]

The Supreme Court's state action jurisprudence has demonstrated a desire to avoid immunizing conduct intended to benefit private, not governmental, purposes. Critics warn, however, that the lower courts increasingly have applied the *Midcal* test in ways that allow defendants to obtain antitrust immunity and thereby trump competition in situations where a state did not intend to displace competition. The ABA Antitrust Section believes that "[s]tate action immunity drives a large hole in the framework of the nation's competition laws."[232] In 2003 the FTC staff issued a report (the FTC State Action Report) recommending "clarification and re-affirmation of the original purposes of the state action doctrine to help ensure that robust competition continues to protect consumers."[233]

Critics raise other troubling issues as well. Some question whether courts have properly taken into account the potential for one state's endorsement of anticompetitive conduct to have spillover effects that raise prices or otherwise harm consumers in other states. Questions also have arisen about whether the state action doctrine should immunize conduct by state government entities and municipalities when they act as market participants. The Commission's recommendations are discussed below.

B. Background

1. The Midcal *Test for Activities of Non-Sovereign State Entities*

a. Clear Articulation

The clear articulation requirement is "directed at ensuring that particular anticompetitive mechanisms operate because of a deliberate and intended state policy."[234] As one leading treatise explains:

> Adoption of a policy requiring a state to make a clear statement of its intention to supplant competition reconciles the interests of the states in adopting non-competitive policies with the strong national policy favoring competition . . . . [I]t ensures that the strong federal policy embodied in the antitrust laws will not be set aside where not intended by the state, and yet also guarantees that the state will not be prevented by the antitrust laws alone from supplanting those laws as long as it makes its purpose clear.[235]

The Supreme Court has established certain parameters for the "clear articulation" test. On one end of the spectrum, "clear articulation" does not require that the state *compel* the anticompetitive conduct at issue.[236] The state also need not explicitly authorize specific conduct to satisfy this prong, as long as the state legislature's intent to establish a regulatory program displacing competition is "clear."[237] At the other end, a general grant of authority that is competition-neutral, such as the authority to operate a hospital or contract for taxi service, does not suffice to show "clear articulation."[238] In *Community Communications Co. v. City of Boulder* the Supreme Court declined to accept the argument that "the general grant of power to enact ordinances necessarily implies state authorization to enact specific anticompetitive ordinances" because to do so "would wholly eviscerate the concepts of 'clear articulation and affirmative expression' that our precedents require."[239]

The question is whether "the State as sovereign clearly intends to displace competition in a particular field with a regulatory structure."[240] In *Southern Motor Carriers Rate Conference, Inc. v. United States* the Supreme Court reasoned that a state legislature's decision to set rates through a public service commission, rather than through market forces, clearly demonstrated its intention to displace competition in motor carrier ratemaking and thus satisfied the clear articulation requirement.[241] The Court also has used a "foreseeability" analysis to evaluate whether a state clearly intended to replace competition with a regulatory structure.[242] In *Town of Hallie v. City of Eau Claire*, where the relevant statutes gave cities the authority to decide where to provide sewage services, the Court reasoned that potentially anticompetitive conduct—refusing to serve or imposing conditions on agreeing to serve—was a foreseeable result of allowing the cities to determine the areas to be served.[243] Accordingly, the Court concluded the statutes evidenced "a state policy to displace competition."[244]

b. Active Supervision

(i) The Purpose of the Active Supervision Requirement

The active supervision prong of the state action doctrine requires that the state has and exercises independent power to review the challenged conduct, and exercises ultimate control.[245] The state must supervise both the general regulatory scheme and the particular conduct at issue.[246] As the Supreme Court stated in *Town of Hallie*, the active supervision prong serves to ensure that the actor is engaging in the challenged conduct pursuant to state policy.[247] It applies to private actors because when they engage in anticompetitive behavior there is "a real danger" that they are acting to further their own interests, rather than those of the state.[248] The "active supervision" requirement addresses the "practical problems inherent in delegating regulatory power: a private party could carry out an initially authorized scheme in a manner inconsistent with state policy."[249]

The active supervision requirement serves other purposes as well, ensuring that the state's regulatory program "actually implements a positive regulatory policy."[250] As the Court explained in *Midcal*, a state may not circumvent the Sherman Act's proscriptions "by casting . . . a gauzy cloak of state involvement over what is essentially a private price-fixing arrangement."[251] In addition, the active supervision requirement assigns political responsibility for actions:

> States must accept political responsibility for actions they intend to undertake . . . . For States which do choose to displace the free market with regulation, our insistence on real compliance with both parts of the *Midcal* test will serve to make clear that the State is responsible for the price-fixing it has sanctioned and undertaken to control.[252]

Finally, the "active supervision" requirement promotes the "citizen participation" value of federalism.[253] Private parties on their own might not offer the public an opportunity to participate in the decision-making process, but the governmental authority that supervises them can ensure that the public has a voice in the regulatory activity.

(ii) Entities to Which the Active Supervision Requirement Applies

The active supervision test applies only when there is a risk that the challenged conduct may be the product of the parties' pursuit of interests other than state policy, and thus its application turns on whether the relevant actor is public or private.[254] Purely private actors are subject to the active supervision test;[255] cities are not. When an entity has a combination of public and private attributes, courts ask "whether the nexus between the State and the [entity in question] is sufficiently strong that there is little real danger that the [entity] is involved in a *private* . . . arrangement."[256]

(iii) Evidence of Active Supervision

To satisfy the active supervision requirement, a defendant must show the state exercises "sufficient independent judgment and control," and that "the details of the [restraint] have been established as a product of deliberate state intervention, not simply by agreement among private parties."[257] Active supervision requires the actual involvement of the state, not just a state's authority to exercise supervisory power. A "negative option" form of supervision (state authority to veto) is not sufficient unless the state has informed itself of the details of the proposed action.[258] For example, in *Midcal* active supervision sufficient to invoke the immunity did not exist because the state authorized and enforced prices established by private parties but did not review the reasonableness of the price schedules or review the terms of fair trade contracts.[259] Active supervision also is not present where the defendants' actions preclude meaningful review. In *Ticor* active supervision was not found where rate filings became effective despite the failure of the rate bureau to provide additional requested information.[260]

C. Recommendations and Findings

75. Congress should not codify the state action doctrine. Rather, the courts should apply the state action doctrine more precisely and with greater attention to both Supreme Court precedents and possible consumer harm from immunized conduct.

76. **The courts should not grant antitrust immunity under the state action doctrine to entities that are not sovereign states unless (1) they are acting pursuant to a clearly articulated state policy deliberately intended to displace competition in the manner at issue, and (2) the state provides supervision sufficient to ensure that the conduct is not the result of private actors pursuing their private interests, rather than state policy.**

Concerns with the state action doctrine should be addressed through continued development of case law in the courts. The Supreme Court's articulation of core state action doctrine standards will, if applied more rigorously, lead to the correct application of the doctrine. There is no need at this time to cement those standards into a statute. Instead, the lower courts ought to apply the Supreme Court's standards with greater precision and to recognize that immunizing anticompetitive conduct through the state action doctrine can cause significant consumer harm. Such harm should not be permitted absent authorization and supervision from the state, as required under Supreme Court precedents. Specific recommendations for how courts can best apply the Supreme Court's teachings and how the doctrine should be refined to address additional issues follow.

1. Clear Articulation

77. **As proposed in the FTC State Action Report, the courts should reaffirm a clear articulation standard that focuses on two questions: (1) whether the conduct at issue has been authorized by the state, and (2) whether the state has deliberately adopted a policy to displace competition in the manner at issue.**

The FTC State Action Report concluded that "[s]ome lower courts have implemented the clear articulation standard in a manner not consistent with its underlying goal."[261] To address this concern, that report recommended that courts ask two questions to flesh out the clear articulation requirement: (1) whether the conduct at issue has been authorized by the state, and (2) whether the state has deliberately adopted a policy to displace competition in the manner at issue. Together, these requirements would refocus the inquiry on the existence of deliberate and intended state policies to displace competition that can justify setting aside national competition goals. The Commission agrees. The lower courts have not always properly implemented Supreme Court teachings on what is required to show a clearly articulated state policy to displace competition.

In *Town of Hallie* the Supreme Court held that the clear articulation standard was met where the alleged anticompetitive conduct—refusing to provide, or imposing conditions on agreeing to provide, sewage service outside the areas a city had chosen to serve—was a foreseeable result of a state law authorizing cities to determine which areas to serve.[262] Following *Town of Hallie*, some courts have applied a low standard for "foreseeability," reasoning that once a state authorizes certain conduct, anticompetitive forms of that conduct may occur and therefore are "foreseeable."[263]

To say that anticompetitive types of conduct are "foreseeable" in this way, however, is not the same as finding "a deliberate and intended state policy" to replace competition with regulation.[264] In *City of Boulder* the Supreme Court emphasized that a general grant of authority does not equate with authority to engage in specific anticompetitive conduct.[265] In *City of Columbia v. Omni Outdoor Advertising Inc.* the Court explained that the relevant statutory authority must include the authority to suppress competition, not just to regulate.[266]

A more appropriate foreseeability analysis appears in *Surgical Care Center of Hammond v. Hospital Service District No. 1*. In that case the Court of Appeals for the Fifth Circuit, sitting en banc, distinguished "a statute that in empowering a municipality *necessarily contemplates the anticompetitive activity* from [a statute] that *merely allows* a municipality to do what other businesses can do."[267] It explained that to infer a policy to displace competition from the mere authority to enter joint ventures would "stand federalism on its head."[268]

As the FTC State Action Report pointed out, "'foreseeability' is a matter of degree."[269] The foreseeability test can work well if "the displacement of competition is inherent in the nature of the legislation itself."[270] If the grant of authority is "competition-neutral," however, the mere possibility of anticompetitive conduct is not sufficient to support a finding of a clearly articulated state policy to displace competition.[271]

Another issue that demands rigorous attention is whether the relevant statute reveals a state's intent to displace competition *in the manner at issue* in the case. The Seventh Circuit's reasoning in *Hardy v. City Optical, Inc.* exemplifies the type of careful analysis that courts should use. In that case, a statute required optometrists to provide patients with some, but not all, of the information needed to purchase contact lenses. An optometry chain denied its patients access to the complete prescriptions, leaving them unable to purchase their lenses through cheaper, mail-order sources. The court held that "Indiana has not sought to supplant the form of competition—competition from mail-order houses . . . that the complaint charges the defendants with attempting to suppress."[272] Therefore, the clear articulation standard was not met. Other courts should apply the state action doctrine with similar rigor.

To be sure, a state does not need to articulate a policy displacing competition in the *precise* manner at issue. Nonetheless, courts should carefully examine the relevant statute, any clear legislative history, and the nature of the authorized conduct to determine whether a state has clearly articulated a deliberate and intended state policy to immunize the particular conduct at issue.[273]

2. Active Supervision

78. The courts should adopt a flexible approach to the active supervision prong, with different requirements based on different situations.*

The active supervision requirement ensures that "'the [private] actor is engaging in the challenged conduct pursuant to state policy,' rather than in pursuit of private interests."[274] Because the active supervision test applies only when there is a risk that the challenged conduct may be the product of parties' pursuing interests other than state policy, its application turns in part on whether the relevant actor is public or private.[275]

As discussed in the FTC State Action Report, the Supreme Court has not yet "provided much specific guidance on the kind of state review of private actions that would constitute 'active' supervision."[276] The Supreme Court's main opinion in this area, *Ticor*, dealt with a situation in which state supervision of the conduct at issue was virtually nonexistent.[277] Especially because the potential antitrust violation was horizontal price-fixing, a violation most "pernicious," the Court was reluctant to formulate a rule that would too easily find active supervision.[278] These factual circumstances did not afford the Court an opportunity to explain how lower courts should address more complex situations.

To focus the active supervision inquiry, courts should use a flexible, "tiered" approach that requires a different level of active supervision depending on the type of conduct at issue, the entity engaging in that conduct, the industry, the regulatory scheme, and other factors.[279] "[W]hat is sufficiently 'active' for active supervision will vary based on the conduct, industry, regulatory scheme, as well as other factors."[280]

For example, if the conduct at issue were price-fixing, the affirmatively articulated state policy would need to be more detailed and specific than if the conduct entailed less clearly anticompetitive activity.[281] Similarly, whether an entity is more or less governmental in nature should influence the degree of active supervision that courts require. This case-by-case analysis of the entity should consider factors such as the entity's structure, membership, decision-making apparatus, and openness to the public.[282] As one leading treatise points out in discussing whether to apply the active supervision requirement, "[w]ithout reasonable assurance that the [entity undertaking the challenged conduct] is far more broadly based than the very persons who are to be regulated, outside supervision seems required."[283] Similarly, such circumstances should require more active supervision than if the entity were constituted substantially of government, not private, actors. The analysis also

* Commissioners Garza, Kempf, and Warden do not join this recommendation. They believe that the proposed "flexible approach" provides no guidance to those subject to the law and invites the courts to decide each case based on its facts alone rather than legal norms.

should examine the degree of discretion private actors had to undertake the challenged conduct,[284] with greater active supervision required to the extent that private actors had a larger degree of discretion. In sum, a flexible analysis would recognize that, to the extent the actor or the challenged conduct suggests an appreciable risk that the challenged conduct results from private actors' pursuing their private interests, rather than state policy, courts should require a greater degree of active supervision than if that risk is lower.

3. Other Refinements to the State Action Doctrine

79. Where the effects of potentially immunized conduct are not predominantly intrastate, courts should not apply the state action doctrine.*

The state action doctrine has been criticized for its failure to consider interstate spillovers.[285] A state's regulation of activities in a manner that overwhelmingly imposes the cost of regulation on citizens of other states impairs both economic efficiency and the political participation goal of the federal system. Accordingly, when the effects of potentially immunized conduct are not predominantly intrastate, the state action doctrine should not create immunity. Those effects can be measured by determining where the costs and benefits of the regulation are borne.

Parker v. Brown, the case that was the genesis of the state action doctrine, is a prime example of the courts' failure to consider interstate spillovers. *Parker* involved a California agricultural marketing program with mechanisms to prorate raisin production within California and thus limit the amount offered for sale. By reducing output, the program raised raisin prices. The vast majority of consumers that paid higher prices for raisins because of California's regulatory scheme were outside the state: between 90 and 95 percent of the California raisins were shipped out of state.[286] Thus, the benefits of the program (more money to the raisin producers) were largely concentrated in California, but the costs (higher prices for consumers) spilled largely into other states.

Such state regulations producing spillover costs to consumers in other states do not deserve deference.[287] Out-of-state citizens adversely affected by spillovers typically have no political participation rights and effectively are disenfranchised on whether the conduct at

* Commissioners Burchfield, Cannon, Delrahim, Garza, and Kempf do not join this recommendation.

Commissioners Burchfield and Garza believe that, so long as a state acts in a way that does not offend the "dormant Commerce Clause," the state action doctrine should cover actions taken by private actors pursuant to that state mandate. Private companies and individuals should, in virtually every instance, be able to comply with the mandate of a state without assessing whether its effect is "predominantly" intrastate, but if the state operates in violation of the United States Constitution by improperly trying to extend its power beyond its own borders, the action would be void and the state action doctrine should not apply.

issue should be authorized by the neighboring state.[288] This is directly contrary to the principles of federalism that form the basis for state action doctrine.

Moreover, economics teaches that where decision-makers reap the benefits without bearing the costs of an activity, they have incentives to engage in more of that activity than is socially desirable.[289] Therefore, when anticompetitive state regulations tend to produce in-state benefits but out-of-state harms, states have incentives to over-regulate. As a consequence, "[t]he resulting economic inefficiencies go unameliorated" and "nonresidents . . . remain exposed to any resulting monopoly spillovers."[290]

The Supreme Court has shown awareness of possible spillover concerns,[291] but has not yet considered whether to reject application of the state action doctrine if the effects of the conduct at issue are not primarily intrastate.[292] To address the significant consumer harm and political representation concerns discussed above, the Supreme Court and lower courts should not apply the state action doctrine when the effects of a regulation are not predominantly intrastate.

80. When government entities act as market participants, the courts should apply the same test for application of the state action doctrine to them as the courts apply to private parties seeking immunity under the state action doctrine.*

A government entity's participation in a market as a competitor is likely to have market-distorting effects if that entity is not subject to the same rules of competition as private competitors. A "market participant" exception to the state action doctrine that would require application of both prongs of the *Midcal* test would ensure that the government entity's behavior is consistent with state policy, and the state action doctrine is applied consonant with its original purposes and goals.[293]

The possibility of such an exception was recognized by the Supreme Court in *Omni* and was urged by Chief Justice Burger's concurrence in *City of Lafayette v. Louisiana Power & Light*

* Commissioners Burchfield, Garza, and Kempf do not join this recommendation.

Commissioners Burchfield and Garza believe that creating an exclusion from the state action doctrine when the state entity acts as a market participant would raise at least the following serious issues. First, when the plaintiff is not a resident of the state, a federal court may well lack jurisdiction over an antitrust action against a state entity under the Eleventh Amendment. Second, such an exclusion would require states in the first instance, and eventually courts, to determine when the action is sovereign and regulatory as opposed to commercial, an extremely difficult determination that will likely lead to inconsistencies, and imposition of liability eventually on taxpayers. *See* City of Lafayette v. Louisiana Power & Light Co., 435 U.S. 389, 433–34 (1978) (Stewart, J., dissenting) (referring to distinction between governmental and proprietary functions as a "quagmire"). Finally, the Commission heard no evidence that states are engaging in an amount of anticompetitive behavior in clearly commercial (as opposed to sovereign) functions that would make such an exclusion necessary or appropriate.

Co. In *Omni* the majority stated in dictum that the *Parker* doctrine "does not necessarily obtain where the State acts not in a regulatory capacity but as a commercial participant in a given market."[294] The Court in *Omni* stated that "with the possible market participant exception, *any* action that qualifies as state action is '*ipso facto* . . . exempt from the operation of the antitrust laws.' "[295]

Chief Justice Burger's concurrence in *City of Lafayette* also suggested a market participant exception.[296] The Chief Justice would have limited the Court's holding in that case to cities acting in a proprietary capacity, and he would have imposed a stricter standard to qualify for the state action defense. He reasoned that the same Congress that "meant to deal comprehensively and effectively with the evils resulting from contracts, combinations and conspiracies in restraint of trade" would not have intended the courts to allow local governments to engage in such anticompetitive conduct without being subject to the Sherman Act.[297] As Burger argued, the case should turn on the conclusion that the plaintiff cities are engaging in "business activit[ies]; activit[ies] in which a profit is realized."[298] He found nothing in the state action jurisprudence to suggest that "a proprietary enterprise with the inherent capacity for economically disruptive anticompetitive effects should be exempt from the Sherman Act merely because it is organized under state law as a municipality."[299]

The Federal Circuit, Third Circuit, and Ninth Circuit have appeared willing to entertain the possibility of a market participant exception.[300] For example, the Third Circuit, in dictum, wrote that there may be a market participant exception to *Parker* immunity.[301] The court relied on *Omni* to note that the state does not forfeit immunity by acting with a private party, but rather "[i]mmunity does not *necessarily* obtain where the State acts not in a regulatory capacity but as a commercial participant in a given market."[302] It pointed out, however, that there is little guidance as to what constitutes acting as a market participant.[303] The Ninth Circuit noted that a market participant exception did not apply in the case at issue because the state entity was not "in competition with" the plaintiffs,[304] but observed that guidance in the state action doctrine jurisprudence is extremely limited. The Eighth Circuit has declined to take the lead in adopting such an exception,[305] and the Tenth and Eleventh Circuits have been hostile to the idea.[306] Those courts noted that the distinction between "governmental" and "proprietary" functions has been abandoned in other contexts.[307]

There is not always a clear distinction between a government entity's activities as a regulator and a market participant,[308] but this hurdle is not insurmountable. Horizontal situations where the government competes with private firms are clear examples of circumstances in which a market participant exception would be warranted.[309] In addition, courts might reason by analogy to the market participant exception to the dormant Commerce Clause. There, the market participant exception is appropriate where the state action "constituted direct state participation in the market."[310] In the case law, this includes a state program to pay people who remove abandoned cars from streets and junkyards, because the payment was interpreted as entry into the market for abandoned cars,[311] and a program to sell output from a state-owned-and-operated cement plant.[312] Clearer guidance regarding closer cases could be provided through case-by-case adjudication. This type of incremental line-drawing is a task to which the federal common law system is both well-accustomed and well-suited.

ANNEX A

Exemptions from the Antitrust Laws

Statutory Exemptions from the Antitrust Laws
Agricultural Marketing Agreement Act, 7 U.S.C. §§ 608b–608c
Anti-Hog-Cholera Serum and Hog-Cholera Virus Act, 7 U.S.C. § 852
Capper-Volstead Act, 7 U.S.C. §§ 291–92
Charitable Donation Antitrust Immunity Act, 15 U.S.C. §§ 37–37a
Defense Production Act exemption, 50 U.S.C. app. § 2158
Export Trading Company Act, 15 U.S.C. §§ 4001–21
Fishermen's Collective Marketing Act, 15 U.S.C. §§ 521–22
Health Care Quality Improvement Act, 42 U.S.C. §§ 11101–52
Labor exemptions (statutory and non-statutory), 15 U.S.C. § 17; 29 U.S.C. §§ 52, 101–15, 151–69; (and common law)
Local Government Antitrust Act, 15 U.S.C. §§ 34–36
Medical resident matching program exemption, 15 U.S.C. § 37b
National Cooperative Research and Production Act, 15 U.S.C. §§ 4301–06
Need-Based Educational Aid Act, 15 U.S.C. § 1 note
Newspaper Preservation Act, 15 U.S.C. §§ 1801–04
Non-profit agricultural cooperatives exemption, 15 U.S.C. § 17
Small Business Act exemption, 15 U.S.C. §§ 638(d), 640
Soft Drink Interbrand Competition Act, 15 U.S.C. §§ 3501–03
Sports Broadcasting Act, 15 U.S.C. §§ 1291–95
Standard Setting Development Organization Advancement Act, 15 U.S.C. §§ 4301–05, 4301 note
Webb-Pomerene Export Act, 15 U.S.C. §§ 61–66

Statutory Exemptions Created as Part of a Regulatory Regime
Air transportation exemption, 49 U.S.C. §§ 41308–09, 42111
McCarran-Ferguson Act, 15 U.S.C. §§ 1011–15
Motor transportation exemption, 49 U.S.C. §§ 13703, 14302–03
Natural Gas Policy Act exemption, 15 U.S.C. § 3364(e)
Railroad transportation exemption, 49 U.S.C. §§ 10706, 11321(a)
Shipping Act, 46 U.S.C. app. §§ 1701–19

Judicially Created Exemptions
Baseball exemption
Filed-rate/*Keogh* doctrine
Noerr-Pennington Immunity
State Action Doctrine
Various implied immunities created in specific regulatory settings

[65] City of Columbia v. Omni Outdoor Adver., Inc., 499 U.S. 365, 374–75 (1991).

[66] This conclusion is not novel. In its 1979 Report, the National Commission for the Review of Antitrust Laws and Procedures expressed a skeptical attitude toward exemptions and immunities in general, notwithstanding the fact that, of its twenty-two members, fully ten were sitting members of Congress. *See generally* Shenefield Report, at 177–89.

[67] Abbott Statement, at 1–2. *See generally* Posner, *Effects of Deregulation on Competition*, at 7; Statutory Immunities and Exemptions Trans. at 72 (Abbott).

[68] This Section uses the terms "exemption" and "immunity" interchangeably to mean any statutory provision that makes liability or damages under the antitrust laws less than fully applicable.

This Section considers only statutory immunities, not those created by courts. The state action doctrine, a judicially created immunity, is discussed in Part 4 of this Section. Part 3 of this Section discusses judicially created "implied" immunities in regulated industries.

[69] *See* 15 U.S.C. § 17 (creating statutory labor exemption and non-profit agricultural cooperatives exemption).

[70] *See* 15 U.S.C. § 37b.

[71] *See* Cassell, *Exemption of International Shipping Conferences*, at 11–16; *see also* ABA Comments re Immunities and Exemptions, at 10; Bush, Leonard & Ross, Framework for Antitrust Immunities, at 8–15; Antitrust Law Developments, at 1273.

[72] *See, e.g.*, ABA Comments re Immunities and Exemptions, at 4–6.

[73] *See id.* at 4.

[74] Some scholars have contended that antitrust immunities are typically the byproduct of special interest regulations spawned by well-organized groups. *See, e.g.*, Frank H. Easterbrook, *The Court and the Economic System*, 98 Harv. L. Rev. 4, 15 (1984) ("One of the implications of modern economic thought is that many laws are designed to serve private rather than public interests."). "Public choice" theory seeks to explain, among other things, how such laws can arise. *See, e.g.*, William N. Eskridge, Jr., *Politics Without Romance: Implications of Public Choice Theory for Statutory Interpretation*, 74 Va. L. Rev. 285, 285–89 (1988); Daniel A. Farber & Philip P. Frickey, *The Jurisprudence of Public Choice*, 65 Tex. L. Rev. 873 (1987); *see also* ABA Comments re Immunities and Exemptions, at 5–6; American Antitrust Institute, Public Comments Submitted Regarding Immunities and Exemptions, at 3 (July 15, 2005).

[75] 42 U.S.C. §§ 11101–52.

Carstensen, Statement at AMC Statutory Immunities and Exemptions, at 2 (Dec. 1, 2005) [hereinafter Carstensen Statement]; Abbott Statement, at 6; Statutory Immunities and Exemptions Trans. at 85, 104 (Carstensen); id. at 101 (Ross); *id.* at 103 (Miller); *id.* at 103 (Abbott); Vehicle Information Service, Inc., Public Comments Submitted to AMC, at 1 (July 13, 2005) [hereinafter VIS Comments]; ABA Comments re Immunities and Exemptions, at 11, 15–17.

[123] In other countries, such a burden of proof is imposed as a matter of law. *See* Treaty Establishing the European Economic Community, Art. 85(3) 298 U.N.T.S. 11 (Mar. 25, 1957) (laying out four quite restrictive conditions any exemption must meet, on a continuing basis, in order to derogate from the basic principle of free competition); European Commission, White Paper on the Review of Regulation 4056/86, Applying the EC Competition Rules to Maritime Transport ¶ 14 (Comm. Prog. 2003/COMP/18, Oct. 13, 2004) (noting than an exemption's "justification" must remain "valid in light of . . . present market circumstances. If not, there would no longer be a legal justification for the . . . exemption, which consequently would have to be either abolished or revised.").

[124] *See* ABA Comments re Immunities and Exemptions, at 9–10.

[125] *See id.* A generally less desirable alternative would be to allow only declaratory judgments and government injunctive challenges to the conduct in question. *See id.* Because the conduct at issue would remain subject to antitrust scrutiny, however, this approach would be preferable to entirely eliminating the potential for antitrust liability.

[126] 15 U.S.C. §§ 4301–06; *id.* § 4301 note.

[127] *See* Bush, Leonard & Ross, Framework for Antitrust Immunities, at 35–38; Statutory Immunities and Exemptions Trans. at 69–70 (Bush); ABA Comments Re Immunities and Exemptions, at 14–15; *see also* Abbott Statement, at 6; Statutory Immunities and Exemptions Trans. at 92 (Miller).

[230] *Ticor*, 504 U.S. at 634–35.

[231] *City of Lafayette*, 435 U.S. at 414. To obtain immunity from antitrust damages (but not from injunctive relief), local governments can rely on the Local Government Antitrust Act of 1984 (LGAA). Local Government Antitrust Act of 1984, Pub. L. No. 98-544, § 2, 98 Stat. 2750 (codified as amended at 15 U.S.C. §§ 34–36). The Act defines local governments as "a city, county, parish, town, township, village, or any other general function governmental unit established by State law or . . . a school district, sanitary district, or any other special function governmental unit established by State law in one or more States." 15 U.S.C. § 34(1). The LGAA bars antitrust damage actions against a local government and precludes the recovery of antitrust damages from any local government official or employee "acting in an official capacity," *id.* § 35(a), and from any private party "based on any official action directed by a local government." *Id.* § 36(a).

The LGAA does not require the actions of a local government to meet either of the prongs of the *Midcal* test. Congress enacted this statute in response to *Community Communications Co. v. City of Boulder*, in which the Supreme Court held that certain conduct by the city of Boulder, Colorado, did not qualify for state action immunity. Community Commc'ns Co. v. City of Boulder, 455 U.S. 40 (1982).

[290] Inman & Rubinfeld, *Making Sense of the Antitrust State-Action Doctrine*, at 1271, 1276.

[291] The Court recognized intrastate spillovers in *City of Lafayette*, noting that decisions of a municipal electric utility may favor the municipality at the expense of "extraterritorial impact and regional efficiency" and could burden consumers living outside the municipality without providing them "meaningful" political recourse. *City of Lafayette*, 435 U.S. at 404–06.

[292] None of the Court's recent cases involved fact patterns that would have raised interstate spillover issues. Ticor affected transactions on in-state property. *Ticor*, 504 U.S. at 627–28. *Omni* involved zoning within a single city. *Omni*, 499 U.S. at 367–69. *Patrick* involved peer review proceedings at a single hospital. *Patrick*, 486 U.S. at 97–99. *324 Liquor* involved mechanisms for raising in-state retail liquor prices. 324 Liquor Corp. v. Duffy, 479 U.S. 335, 340 (1987). *Southern Motor Carriers* involved regulation of intrastate trucking rates. *Southern Motor Carriers*, 471 U.S. at 50–53. *Town of Hallie* involved sewage treatment for areas surrounding a single city within a single state. *Town of Hallie*, 471 U.S. at 36–37. *Hoover* involved admission to the practice of law in Arizona. *Hoover*, 466 U.S. at 560–65. *City of Boulder* involved cable television regulation governing a single city. *City of Boulder*, 455 U.S. at 45–47. *Midcal* involved mechanisms for raising in-state retail wine prices. *Midcal*, 445 U.S. at 99–100.

[293] The Supreme Court has expressly rejected a market participant exception to the Eleventh Amendment's divestiture of federal courts of jurisdiction to hear certain claims against states. College Sav. Bank v. Florida Prepaid Postsecondary Educ. Expense Bd., 527 U.S. 666 (1999). However, some commentators have argued that the Court's reasoning is not readily transferable to the antitrust context. *See, e.g.*, Robert M. Langer & Peter A. Barile III, *Can the King's Physician (Also) Do No Wrong?: Health Care Providers and a Market Participant Exception to the State Action Immunity Doctrine*, *in* MATTHEW BENDER'S ANTITRUST REPORT 26 (1999); *see also* Robert M. Langer, Statement at AMC State Action Doctrine Hearing, at 3 (Sept. 29, 2005).

[294] *Omni*, 499 U.S. at 374–75. The Court explained that the language from *Parker* suggested only that the state action doctrine might not apply when a state acts in a commercial capacity rather than as a sovereign. *Id.*

[295] *Id.* at 379.

[296] *City of Lafayette*, 435 U.S. at 419 (Burger, C.J., concurring). Justice Stewart (joined by Justices White, Blackmun, and Rehnquist), dissenting in *Lafayette*, disagreed with the Chief Justice, arguing that the Sherman Act simply was not intended to cover the acts of governmental bodies and that "it is senseless to require a showing of state compulsion when the State itself acts through one of its governmental subdivisions." *Id.* at 428, 432. Justice Stewart also noted that the distinction between "proprietary" and "governmental" activities has been described as a "quagmire" and that a proprietary activity of government is nonetheless governmental. *Id.* at 433–34.

[297] *City of Lafayette*, 435 U.S. at 419 (Burger, C.J., concurring).

Separate Statement of Commissioners Burchfield, Delrahim, Jacobson, Kempf, Litvack, Valentine, and Warden

Congress created this Commission in 2002 for the purpose of examining "whether the need exists to modernize the antitrust laws and to identify and study related issues." Although federal commissions to evaluate the functioning of the antitrust laws are not new, this is the first such commission formed by Act of Congress in 65 years, and the first charged with a full scale review of the antitrust laws since the late 1970s.

Much has changed in the intervening decades. For example, international trade is less restricted and more prevalent, economic analysis of markets and marketplace behavior has become more sophisticated, American public policy has tended to be more firmly pro-competitive and anti-regulatory, the Antitrust Division of the United States Department of Justice and the Federal Trade Commission have become more rigorous in analyzing allegations of anticompetitive behavior, state attorneys general have become more active in enforcing both federal antitrust laws and state competition laws, and courts have begun to eschew simplistic rules in favor of careful analysis. Formation of this Commission was timely and appropriate to assess the impact of these events on the administration of the nation's antitrust laws.

Against this background, the Commission came to its task with no set preconceptions. Drawn from varied political and professional backgrounds, the Commission has invited and heard testimony, and received written submissions, from distinguished academicians, practitioners, and government officials representing a variety of viewpoints on a broad array of controversial subjects. We believe that the Commission has heard and read these submissions with an open mind and, with the invaluable assistance of its outstanding staff, has carefully evaluated the diverse viewpoints.

Although the Commission has not been unanimous in all its findings, we believe it has achieved a remarkable degree of consensus, especially considering the difficult issues it has considered. We do not agree with every recommendation in the report, nor do we uniformly agree with each other, but we hope and believe the report, taken as a whole, should serve as an influential text for Congress, the President, judges, antitrust enforcers, and practicing lawyers.

Overall, the Commission's findings indicate that the antitrust laws are working reasonably well. This is due in large measure to the willingness and ability of courts in our common law system and of antitrust enforcers to revisit incumbent approaches to antitrust issues in light of advances in economic thinking and globalization. We applaud this receptiveness to new thinking by both courts and enforcers, and have every reason to believe that it will continue. If it does, the antitrust laws will continue to fit well with the ever-evolving United States and international economies. And the competition laws of the United States will continue to influence those of other nations.

The Commission did find some notable problems in particular aspects of antitrust law, however, and is therefore recommending a number of carefully considered changes. Some of the recommendations in the report, such as repeal of the Robinson-Patman Act, are not new. The Commission heard persuasive testimony and examined literature that convinced it that the Robinson-Patman Act has failed to serve its intended purpose of protecting small retailers from large chains, whereas its effect, if any, is to dampen vigorous price competition. The Justice Department ceased active enforcement of the Robinson-Patman Act decades ago, and the Federal Trade Commission has rarely enforced it in recent years. Even though it has had a formidable political constituency in the past, we believe a consensus against it has formed and the time has come for outright repeal.

In contrast to the frequent examinations of the Robinson-Patman Act, this is the first Commission to examine the practical effects of *Hanover Shoe* and *Illinois Brick*. Unquestionably, the Supreme Court's desire to save federal courts the difficult and complex task of tracing overcharges due to antitrust violations through the chain of distribution was well-intended. Nevertheless, these decisions have failed to achieve that aim and their practical consequences have proved much too costly. To begin with, under *Illinois Brick*, a direct purchaser who has succeeded in passing on all or a large part of the overcharge will realize an unjustifiable windfall. This windfall would be preserved by proposals to preempt state indirect purchaser statutes, proposals we believe are also politically unachievable. Under *Hanover Shoe*, the windfall is preserved even if federal direct purchaser actions are somehow consolidated for trial with state indirect purchaser actions. This result occurs because *Hanover Shoe* prevents a defendant from asserting or benefiting from the pass on defense against direct purchasers even if (hypothetically) the indirect purchasers were in the same courtroom in the same trial, and allowed to prove the same facts regarding pass on that *Hanover Shoe* prevents the defendant from proving.

A further unintended consequence of the *Illinois Brick* rule has been the advent of indirect purchaser lawsuits in state courts. Removal of these cases to federal court pursuant to the Class Action Fairness Act or otherwise has eviscerated the Supreme Court's desire to protect federal courts from the complexities of tracing overcharges through the chain of distribution. Indirect purchaser actions have unquestionably imposed an administrative burden on both state and federal courts. Even in those rare instances in which all state actions can be removed to federal court and then consolidated with all federal actions by the Judicial Panel on Multidistrict Litigation, current law requires that the cases be returned for trial to the federal district courts from which they were transferred.

The time has come, we believe, to overrule both *Illinois Brick* and *Hanover Shoe*, so that victims of antitrust violations receive just compensation, trebled, in a judicial environment that is efficient and fair to all concerned. We believe the Commission's recommendations regarding *Illinois Brick* and *Hanover Shoe*, though perhaps not perfect, would produce a major improvement over the current situation.

The Commission's ability to analyze these and other topics in a dispassionate way, with the benefit of considerable assistance from witnesses, public commenters, and a highly capable staff, will, we hope, contribute to the continuing reasoned evolution of the antitrust laws.

Separate Statement of Commissioner Carlton

I submit this statement in order to elaborate on certain topics covered and not covered in the Report.* I appreciate the difficulty of writing a report reflecting the views of many and compliment the Chair, Vice-Chairman, the other Commissioners, the Executive Director & General Counsel, and the staff for their work. Although differences in wording and tone undoubtedly exist from what I would have chosen, I restrict my comments here to a few select topics. I have tried to keep my comments brief and make reference to some of my articles and textbook for the reader interested in the details of my reasoning.

Tests for Exclusionary Conduct: Exclusionary conduct cases are highly varied and therefore one should not expect that a test that works well in one type of case will necessarily work well in another. Safe harbors for predation have little bearing on safe harbors for exclusive dealing. Developing different safe harbors for different types of conduct should be a priority. Proposed tests (e.g., profit sacrifice or no economic sense) that require one to specify the logic or profit of an act, but for the exclusion, can require a complex calculation subject to error. These proposed short cuts will work in only some exclusionary conduct cases. *See* Carlton (2007b).

Bundling: Although I vote in favor of the suggested safe harbors on bundling, I emphasize that they may fail to protect unobjectionable conduct. The justification for the first of the three pronged test (incremental revenues exceed incremental costs) seems to be based on an analogy to the Areeda-Turner (A-T) predation test that a safe harbor exists if price exceeds marginal cost. The analogy of bundling to price predation is faulty. In the predation model of A-T, there is one price. In the standard competitive model, it is odd for price to be below marginal cost in the absence of a predatory goal and, therefore, if one does observe this peculiar fact, one can go on to ask whether predation is likely by examining the possibility of recoupment. In the context of bundling, it is *not* odd to have the firm fail the first prong of the AMC test in the absence of a predatory goal. The reason is that bundling can be used as a method of price discrimination and it can be optimal for a firm, with no predation motivation, to set prices that fail the first prong. For example, if a razor manufacturer bundles a razor and razor blades together in a package and the bundle price is less than the price of blades plus the cost of the razor, then the pricing fails the first prong, even though this is a profitable strategy when one considers the future sales of razor blades. This type of pricing is well known to economists and not uncommon. *See* Carlton and Perloff (2005, ch.10).

---

* This statement, as well as my votes and opinions in the report and in deliberations, does not necessarily reflect the views of the Antitrust Division of the Department of Justice where I am currently serving as Deputy Assistant Attorney General for Economic Analysis.

By offering product A separately from the bundle consisting of (A, B), a monopolist can separate consumers into different groups and charge different prices. *See* Carlton and Perloff (2005, pp.324–30). The first prong of the AMC recommendation ignores the revenue benefit from this separation. Moreover, adoption of the first prong could cause some firms to offer only the bundle and therefore make it impossible to apply the first prong of the test. If the first prong is adopted by courts, they must understand that a defense for the pricing based on legitimate business reasons unrelated to predation should be allowed so there should not be a presumption (as there is in the A-T price-marginal cost test) that failing the first prong should suggest that something odd is occurring. Moreover, a defense showing the challenged pricing was used either for many years (so predation is unlikely) or during a time with no possibility of predation should allow a firm to escape liability.

Tying: The laws of tying need clarification. There is no escaping that tying is ubiquitous, can be efficient, yet can also harm competition. Therefore, the per se treatment of tying makes no sense while the rule of reason as articulated in *Microsoft* does. The logic of the leading case on tying, *Jefferson Parish*, is often non-economic. "Forcing" in particular is a peculiar concept. Courts should distinguish between tying that is price discrimination (which may help or harm consumers, but which is generally legal), and tying that can alter the competitive structure even for consumers not interested in buying the tying product. Only the latter should be subject to antitrust liability. *See* Carlton and Waldman (2002, 2005, 2006, forthcoming), Carlton (2001, 2007a).

Indirect Purchasers and* Illinois Brick*: I oppose the recommendation to overrule *Illinois Brick*, a decision that eloquently spells out the difficulties of allowing indirect purchasers to sue. I recognize that in certain cases direct purchasers may not have an incentive to sue. I therefore would allow minor exceptions to a ban on allowing indirect purchasers to sue. I would recognize the exceptions described in *Illinois Brick*. I would also consider allowing an exception when an insufficient percent (by volume of sales) of direct purchasers sue within a certain time period, as can occur when direct purchasers fear suing their major supplier. Further study is needed to determine what is an appropriate time period and to define "insufficient". I would preempt state laws regarding indirect purchasers.

I oppose the AMC recommendation to allow the removal of state claims on behalf of indirect purchasers to federal court. Although I oppose the recommendation, it would be improved if instead of removal, state claims were preempted and replaced by a limited federal right allowing indirect purchasers to sue.

Treble Damages: One purpose of damages is to deter undesirable conduct. A multiple of damages is needed when detection is not certain or when some parties are unable to sue to collect damages. I favor a reduction in the multiple to single damages when the actions are overt (e.g., exclusive dealing), and an increase in the multiple when there are some parties affected by the act who are unable to sue (e.g., foreign consumers in an international price fixing case). *See* Carlton (2007a). There are already limited instances in which only single damages are available (for example in the case of research joint ventures) in recognition of the principle that treble damages can under certain circumstances deter efficient behavior.

Contribution: I do not favor allowing non-settling parties to sue each other for claims for contribution because it involves a use of court resources and I am not convinced that it leads to more efficient deterrence.

Attempts to Conspire: If person A asks person B to fix prices, and person B refuses, it is unclear whether person A faces antitrust liability. I would alter the relevant laws including civil or criminal fine authority to allow antitrust liability and penalties on person A.

Robinson-Patman (RP): If repeal of RP does not occur, I would recommend that courts impose a requirement of antitrust injury in order to trigger antitrust liability under RP.

States' Merger and Non-Merger Authority: I would confine the states' antitrust authority to local matters and to those involving price fixing, boycotts, bid rigging, and market allocation. I would eliminate the states' authority to sue in cases involving mergers or other non-merger matters. I would preserve the right of states to sue in their *parens patriae* capacity for the exceptions I discuss above regarding suits by indirect purchasers. Based on evidence presented to the Commission, I fear that some states are understaffed in the area of antitrust and that there can be differences between the objectives of state antitrust enforcers and federal antitrust enforcers where this difference could lead states to pursue antitrust actions in which there is no antitrust injury. Moreover, because the actions of one state can affect other states when matters are not local, I favor confining states' antitrust activities to those involving only local matters. I would further confine their activities to hard-core antitrust offenses because that is where they already devote a considerable amount of effort and because that is where antitrust doctrine is clearest.

Study of Antitrust: Empirical studies of antitrust policy are needed to ensure that antitrust policy is appropriate. Retrospective studies of past policies can be useful. For example, studies of allowed mergers can confirm whether prices rose or fell after particular mergers. A finding of a systematic increase in price after mergers could indicate that merger policy is too lax. A more difficult, though perhaps more important issue, is the effect of antitrust policy on the economy. For example, a decision to forbid a particular merger may dissuade other firms from merging despite the fact that the merger involving those firms may enhance efficiency. Similarly, a decision such as that in *LePage's* that cast doubt on the legality of common pricing practices could impose costs on the economy as many firms readjust their pricing to conform to the particular decision.

Clearance Disputes: The report discusses the need to assign a merger case quickly to either the FTC or DOJ when a dispute arises between the two agencies as to which agency has the better expertise to handle the merger. Resolution of this issue is related to the much broader issue of how in the long run, industries should be assigned to either the FTC or DOJ. As some industries develop and others decline, there should be some mechanism to make sure that the industries be assigned to agencies with a sense of keeping the agencies in some balance.

Consumer versus Total Surplus: There continues to be a debate as to whether the antitrust laws should focus on only consumers (consumer surplus) or on both consumers and producers (total surplus). Aside from doubting the practical significance for most cases of resolving this issue, I note that I favor total surplus and that total surplus is what is used routinely in cost-benefit analysis, a tool of widespread use in public policy. I also note that there is a gaping logical inconsistency between favoring a consumer only objective and at the same time opposing a cartel to monopsonize. A cartel to monopsonize lowers total surplus but does not affect consumers in the standard models of monopsony. This logical inconsistency is one illustration that the focus on only consumers is undesirable. *See* Carlton (2007a).

Market Definition: The misuse of market definition cases is common especially in Section 2 cases when the analyst attempts to apply the market definition procedures of the Merger Guidelines. The arbitrariness in how markets are defined undoubtedly leads to significant error. I regret that the report is silent on the topic of market definition. *See* Carlton (2007b).

Market Power: The courts and economists are often unclear what the term "market power" means. Pricing above the competitive level, which is often taken to be marginal cost, is one common definition. If the market cannot be competitive, what should be used as "the competitive level"? Should one focus on rates of return and see whether the return is above the competitive levels? What is the difference between "market power" and "monopoly power"? How much market power is significant? How durable should the power be? The AMC is silent on these issues, which are in need of clarification. *See* Carlton (2007b).

Reports on Regulatory and Legislative Actions: The agencies should have a free hand to investigate and report to the American public the consequences on competition and on American consumers of various federal, state, and regulatory actions without fear of retaliation. Once they are aware of the costs their actions impose, the relevant government bodies can then decide whether their interference in the competitive process is justified by non-economic or political goals. Aside from examining various exemptions, the effect of International Trade Commission decisions would be a useful subject to study. By making transparent the costs of interfering in the competitive process, the public might be better informed and better served than they would otherwise be.

Competition Advocacy: The FTC and DOJ have a large concentration of economists and lawyers knowledgeable about the benefits of competition. They should be, but are not always, used effectively as a resource by other federal and local government agencies for structuring regulations in a way so as to not interfere too much with the competitive process.

Foreign Training: A desirable and recent phenomenon is the development of antitrust agencies around the world. An investment in the training of foreign enforcers is a good one for the U.S. Such training should receive high priority.

Separate Statement of Commissioner Delrahim

It has been a true pleasure and honor for me to have had the opportunity to serve on this Commission with such a distinguished and dedicated group of professionals that despite different political affiliations all recognized the value of competition in advancing the marketplace and ultimately consumer welfare.

As the Commission's work progressed over its three year mandated life, I grew increasingly pleased with the recommendations and the general consensus the Commission was able to reach on most issues. My time serving in the legislative and executive branches in the government taught me that the best way to advance policy is to have as broad consensus on issues as possible. This is often possible if the position advocated is principled and those determining the policy approach the issue in a principled and serious manner. That was the result of the Commission's work and in large part due to the thoughtful approach and process implemented by the Chairman and the Vice-Chairman, Deb Garza and Jon Yarowsky, respectively, who deserve great credit for instilling a sense of unity to the group. In addition, the professionalism and dedication to competition of each of the Commissioners made the implementation of the goals of Commissioners Garza and Yarowsky possible.

Even with the largely consensus recommendations presented here, there were, of course, differences. These differences were generally few, and Commissioners were content to have had their votes recorded accordingly. We all abided by the process whereby the majority view prevailed. In fact, we worked hard where possible, even in those situations where we found ourselves in the minority, to make suggestions so the ultimate recommendation would enjoy as close to consensus support as possible.

Antitrust and Patents:

In all aspects of the Commission's study, except for one, the Chapter on Antitrust and Patents, I believe the consensus process was followed and whether I agreed with the majority or not, I was comfortable that the Commission, through its adopted process, selected an issue for study, sought public input from those involved, fairly deliberated the issues, voted on them, debated the issue after the vote and discussed the recommendations it would make. It is the recommendations contained in the very critical chapter on Antitrust and Patents that, in my view, unfortunately the Commission does not have the benefit of the full and fair record and deliberation they warrant.

It is because of this that I feel compelled to write a separate statement to present a full background of the very complex and important issues presented for the benefit of my fellow Commissioners as well as the public and the policy makers who will consider the recommendation of this report.

In my view, without taking anything away from all of the other critical issues that the Commission studied and I participated in, the most lasting impact of the Commission's work is the effect of its commentary in two areas: (1) international; and (2) antitrust and intellectual property, and particularly as these two areas intersect.[1]

I hold these two areas for several reasons. One is the globalization of antitrust laws, with approximately 90 international trading partners with antitrust regimes without an international agreement or common standard of what the laws should be. Another is the fact that intellectual property-based exports—whether copyrighted music, movies or software, or patent-protected goods such as pharmaceuticals or electronic products—have become this country's number one export. As such, their creation and protection is critical to maintaining a vibrant economy. But, with the rapid pace of globalization, intellectual property rights are increasingly crucial to all sectors of the global economy as well. Moreover, as firms innovate, manufacture and market their products globally, licensing of the intellectual property rights they hold or need often proceeds on a global scale, and differences among nations' licensing rules have the potential to disrupt cross-border commerce. As a result, I think this Commission has an important and justified interest in the choices the U.S. Government and other jurisdictions make about how their antitrust authorities will analyze the restrictions that appear in intellectual property licensing agreements.

My colleagues on the Commission are well familiar with my passion for this area for the creative and innovation community. I am heartened that we now live in an era in which the benefits of intellectual property rights are recognized around the world and the protection of these rights, once they have been recognized in any one country or region, is often made global through a patchwork of bilateral and multilateral agreements. These agreements have played a vitally important role in creating a bundle of rights and obligations that in effect globalize the protections for intellectual property.

That is why I feel so deeply about any issues this Commission studied or recommendations it now suggests. In my view, antitrust law and policy must be careful not to constrain the legitimate exercise of intellectual property rights. The application of antitrust laws must not illegitimately stifle creators or innovation by condemning pro-competitive activities that would maximize incentives for investments or efficiency-maximizing business arrangements. Antitrust enforcers should also strive to eliminate as much as possible the unnecessary

[1] As I have disclosed to my fellow Commissioners, over the past year, I have represented many technology companies who may or may not fully support the statements that I make here. My views and passion on the topic here are a matter of public record from my speeches and articles while at the Department of Justice or while I was a staff member of the Senate Judiciary Committee. For the purposes of full disclosure, these companies have included Oracle, Microsoft, Micron, Qualcomm, Intel and Apple. I also represent other companies who might be interested in my comments here, including Johnson and Johnson, sanofi-aventis and the Medical Device Manufacturers Association. I do not and have not represented any of these companies before this Commission. I have represented Qualcomm before the US and foreign antitrust agencies on some of the topics I discuss here.

uncertainties for innovators and creators in their ability to exploit their intellectual property rights, as those uncertainties can also reduce the incentives for innovation. Only when the holders of intellectual property rights go beyond the legitimate exercise of these rights should antitrust law be used to constrain their activities, and only then in a manner that is based on sound economic policies.

There were many issues I wish we had the resources to study, as did a number of my fellow Commissioners. We all recognized early on and respected that to do a thoughtful job, we must restrain our desires and study a limited number of issues in accordance to a process adopted by the Chair and the Vice-Chair at the outset. It was within that process that a subcommittee voted on a set of issues to recommend to the full Commission and the Commission voted on those issues that a majority thought worthy of further full study to include public comment and full deliberation.

Unfortunately, the very important, yet very complex issue of the antitrust treatment of standard-setting was not one of those issues selected for study. As such, this Commission did not receive nor debate in its regular course full testimony on the topic for all Commissioners to be fully informed of all the issues at play and the policies at stake. I therefore do not support the Commission's recommendations in this chapter, nor believe it is worthy of this Commission's support given the amount of thought and deliberations other topics of study rightfully and thoughtfully received. It is in that spirit that I provide the following background so the public and my fellow Commissioners have the benefit of at least this Commissioner's thoughts on this critical issue. Moreover, I withheld my support for a wholesale endorsement of the FTC and NAS patent reform recommendations, not because I disagree with them, but as I stated during the deliberations, I believe that this Commission did not spend nor have the resources to spend to review each of the recommendations for it to put its credibility behind all recommendations the ramifications of which it did not fully consider or deliberate.

I now turn to the issue of standard-setting and antitrust and the Commission's inadequate background and debate behind its recommendations in this area.

This is undoubtedly one of the most interesting and important areas of debate in antitrust and innovation policy today. It is interesting because it challenges some of the basic concepts of intellectual property rights (IPR) and antitrust policy, and because it is an unsettled and evolving area of the law. This issue is critically important because the legal and regulatory framework for standard setting has—and will continue to have—a profound effect on the way innovative ideas get to market and innovators get compensated, and hence affects the whole innovation policy debate.

With true humility and recognition of my lack of economic training, I suggest—and I believe economists have universally recognized—that there are two types of efficiency in the context of this discussion. The first is called static efficiency, and it occurs when two or more companies are competing within a particular technology. The competition among those firms will lead to a streamlining of production and other cost-saving steps in order to reduce manufacturing costs and, ultimately, the price consumers pay. Although the benefits of static efficiency are very important, they are incremental gains. In contrast, the other type of efficiency, dynamic efficiency, results when an entirely new technology is developed and made available to consumers. Dynamic efficiency has much more dramatic effects on consumer well-being, and therefore is an appropriate focus of attention for policymakers.

Standard-setting should be viewed as a potential means for bringing about dynamic efficiency. In the words of current Deputy Assistant Attorney General Gerald Masoudi, my friend and successor at the U.S. Department of Justice Antitrust Division, "The goal of standard setting, generally speaking, is to find the best combination of technical success, cost, and time-to-market, while also delivering enough economic surplus that all parties (inventors, producers, and consumers) can share, so that the product is commercially viable."[2]

The setting of industry standards has proven useful and important to many sectors of the economy. By allowing products produced by different firms to function together, the setting of standards has made many products more valuable to consumers and often increased their utility. The setting of a standard for telephone cords and plugs, for example, has enabled the proliferation of devices and components that consumers purchase, knowing that they will plug into the phone or phone jack they have at home. As the global economy is increasingly characterized by information technology and intellectual property, the setting of industry standards has become both more critical and more complicated. Companies in high-technology industries understand the value of interoperability, which produces a strong incentive for companies within an industry to agree on a standard. Most often, standards are set in a reasonable and productive way that benefits both the companies that produce items utilizing that standard, as well as the consumers who buy them.

Standard setting is becoming a more prevalent practice particularly in the new digital marketplace. Standards for data transmission, for digital content protection, and for authentication are all becoming necessary elements for a robust and interconnected digital economy.

Industry standards can be created through de facto consumer preferences won through competition in the marketplace (*e.g.*, Microsoft's Windows Operating System) or through collaboration on *de jure* standards in formal standard setting organizations. The standards, created for the operation of 3G Wireless technology, for example, were a result of a global effort by governments and private industry participants. Another example is the collaboration of industry participants in the DVD Forum to approve a format for high definition digital versatile discs (HD-DVD), using its open standards process. Standards can also be developed through

[2] Gerald F. Masoudi, Deputy Assistant Attorney General, Antitrust Division, U.S. Department of Justice, *Efficiency in Analysis of Antitrust, Standard Setting, and Intellectual Property*, High-Level Workshop on Standardization, IP Licensing, and Antitrust, Tilburg Law & Economic Center, Tilburg University, Chateau du Lac, Brussels, Belgium (January 18, 2007), at 5.

government-sponsored initiatives (the FCC's V-Chip regulation is one example) or through efforts by smaller groups of private industry participants (such as those efforts by the Blu-ray Disc Association (BDA) to create independently a format for "next generation" optical disk technology).

Standards are often procompetitive because they are designed to curb modern-day problems associated with network markets and interoperability requirements. Standards can also facilitate competition among competitors who are vying to have their technology selected as the "winning" standard. A good example is the "standards war" for the next generation DVD format between members of BDA (led by Sony) and supporters of Toshiba's and NEC's HD-DVD format. Although technical aspects of the Blu-ray and HD-DVD formats differ, next generation optical discs are generally attractive because they promise significantly enhanced piracy protection, more interactive features, and greater storage capacity.

The war between Blu-ray and HD-DVD may remind many of us of the Betamax/VHS struggle to become the standard technology for video cassette recorders. We know that in the end, the market could not sustain the competing formats and VHS prevailed. Perhaps history will repeat itself, and vigorous competition will create a de facto standard, achieved by operation of the market. Or perhaps market forces will drive these competitors to agree on one standard, possibly incorporating the most attractive aspects of each format. In either case, it appears this battle will be fought and won in the marketplace, where it belongs.

De jure standards that are established through collaboration raise different competition concerns, for example, when the standard setting process is used to exclude industry participants from having their technology considered by the group. Collaborative standard setting, some say, can foster collusion on the terms at which the winning intellectual property can be licensed. Some also claim that winning intellectual property owners can hold-up the implementation of the standard by imposing onerous licensing terms. I wish the Commission could have studied this claim. There doesn't seem to be much empirical evidence of this.

Problems further arise when standard setting organizations adopt uncertain disclosure rules, setting the stage for what has become known as "disclosure hold-up," the intentional failure to disclose intellectual property rights that would be infringed by complying with the standard after the standard is adopted.

The answer for the so-called patent holdup suggested by some has been *ex ante* negotiations between the patent holder and the standards participants. This is what the Commission seems to endorse, but the issue is not that simple. My concern is that without more guidance, the Commission's recommendation will have a potential to be misinterpreted and ultimately result in reduced innovation.

Let me provide some background on different approaches for competition policies in standard setting organizations. Standard-setting organizations have tried three main mechanisms to address competitive hold-up issues through their organic policies: reasonable and nondiscriminatory licensing (RAND) commitments; mandatory predisclosure; and *ex ante* licensing.

The first approach, RAND, has succeeded for the most part. Sometimes, it is the "reasonableness" of licensing prices that leads to trouble. Parties to such an agreement understandably see things much differently before a standard is set than afterward, or *ex post*. And the party whose technology is chosen as the standard may very well have a different view of what price is reasonable for the others to pay.

Mandatory disclosure, the second mechanism, relies upon the parties not only to fully disclose all of their relevant technology, but also to fully understand each other's technology prior to standard setting. Both are high burdens, particularly in light of the fact that standard setting can take unpredictable paths and can therefore encroach on technology that parties did not foresee as relevant. Predisclosure thus can suffer unintentional under-disclosure—but also can suffer from intentional under-disclosure and even over-disclosure. Either situation highlights the weakness of predisclosure agreements, even though it is probably the most effective mechanism with appropriate enforcement by private or public authorities for any fraudulent activity by the standards participant.

The third mechanism, *ex ante* licensing, the supposed subject of the recommendation of the Commission, has become the most controversial. The idea behind *ex ante* licensing is that, prior to standard setting discussions, the participants will agree on the prices to be paid for the intellectual property that may govern the selected standard. One theory behind this approach is that it eliminates so-called patent hold-up because the party whose technology is chosen as the standard is bound to license that technology at a pre-bargained or pre-disclosed maximum price.

The problem with *ex ante* licensing, however, is that it could facilitate horizontal price fixing because it is done in a group of potential horizontal competitors who are sharing prices and other terms. In addition, any joint discussions, negotiations, and setting or royalty and other licensing terms may reduce any procompetitive benefits of the standards process and raise risks of collusive exercise of monopsony or oligopoly power. For example, such collective conduct directed at establishing licensing terms may drive the value of IPR contributed for standardization below its optimal prices and toward its marginal cost—that is, zero. The Antitrust Division and Federal Trade Commission recognize the adverse competitive effects of such conduct. The DOJ/FTC *Horizontal Merger Guidelines* explain that "[m]arket power also encompasses the ability of a single buyer (a 'monopsonist'), a coordinating group of buyers, or a single buyer not a monopsonist, to depress the price paid for a product to a level that is below the competitive price and thereby depress output. The exercise of market power by buyers ('monopsony power') has adverse effects comparable to those associated with the exercise of market power by sellers.[3] Agency joint venture policy also includes express recognition of the serious competitive risks associated with the exercise of buyer-side mar-

[3] U.S. Department of Justice and the Federal Trade Commission, *Horizontal Merger Guidelines* (issued April 2, 1992, revised April 8, 1997), at § 0.1.

ket power. A buyer collaboration—which is what would exist if royalty and other license terms were collectively established in the standards setting context by a group comprised primarily of prospective licensees—can "create or increase market power . . . or facilitate its exercise by increasing the ability or incentive to drive [down] the price of the purchased product, and thereby depress output, below what likely would prevail in the absence of the relevant agreement."[4]

In fact, there are circumstances in which case law would support the continued application of a *per se* rule to ensure that there will not be a collusive buyers' cartels.[5]

Let me now mention two items that underscore the very live and active issue that the Commission, in my view, is addressing without fully appreciating the impact. These two items are the VITA Business Review Letter and the IEEE Request for Business Review Letter.

In October 2006, the Antitrust Division rendered a favorable business review letter to the VMEbus International Trade Association (VITA), a group that develops standards for certain computer bus architecture.[6] The VITA *ex ante* licensing policy included, among other things, these five provisions: (1) Disclosure of all patents or patent applications that believes may become essential to implementation of the future standard. Members must do this before a working group is formed, sixty days after the working group is formed, and then fifteen days after the draft standard is published. (2) Disclosure of maximum royalty rates and terms they will demand for essential rights. These rates and terms are binding. (3) Agreement that the commitments apply only to the particular standard being developed and not to other uses of the technology. (4) Commitment not to negotiate licensing terms among working group members or with third parties. (5) Agreement to arbitrate any disputes over members' compliance with the agreement. The policy lists some consequences for non-compliance, including that the penalty for failure to disclose an essential patent is a free license of patent rights related to the standard.

The DOJ's response letter concludes that this specific VITA policy was not likely to harm competition. It found that the prohibition on joint negotiation of licensing terms protected against unfairly low royalties due to anticompetitive acts. The patent holder is free to nego-

Skitol (Oct. 30, 2006), http://www.usdoj.gov/atr/public/busreview/219380.pdf; *see also* Press Release, U.S. Dep't of Justice, Justice Department Will Not Oppose Proposal by Standard-Setting Organization on Disclosure and Licensing of Patents (Oct. 30, 2006), http://www.usdoj.gov/atr/public/press_releases/2006/219379.pdf.

tiate after the standard is set, but will continue to be bound to the maximum terms it set forth earlier.

One month after the DOJ issued the VITA Business Review Letter, the Institute of Electrical and Electronics Engineers, Inc. (IEEE) and its Standards Association (IEEE-SA), requested a Business Review Letter concerning proposed changes to the IEEE-SA's Patent Policy. That request is still pending. The IEEE-SA request apparently would apply to more than 1300 standards in a wide array of fields. Like the VITA policy, the IEEE-SA policy would compel patent owners to disclose their rates and terms in order to avoid the possibility that their technology will be excluded from consideration in the standard setting. But unlike the VITA policy, the IEEE-SA policy, as I understand it, appears to contemplate that the rates and terms of prospective licenses will be discussed within the organization as part of its consideration of the relative costs of the competing technologies, and outside the organization as well. The IEEE-SA maintains that these provisions are reasonably necessary to prevent the imposition of "unexpected" royalties *ex post*. What are these when we deal with patented technology? The goal of any antitrust policy cannot be that the ultimate price of intellectual property inputs is or should be zero.

The VITA and IEEE-SA policies are not only changing the way standard-setting organizations operate, but also may be tilting of the process in favor of IPR users at the expense of IPR owners, and perhaps to innovation itself. After all, these policies are essentially "reverse auctions" held by a coordinated group of horizontal actors whose goal is to reduce royalties to as low a level as possible. And with the DOJ's favorable letter(s), standard-setters' fears of buy-side antitrust liability based on the district court decisions in *Sony v. Soundview*[7] and *Golden Bridge v. Nokia*[8] will be limited at best. The result could be a classic "buyers' cartel" exercising *per se* unlawful market power with the effect of: (1) reducing the incentive to innovate both in core technologies and complimentary applications; (2) depriving consumers of products based upon superior technology; (3) artificially lowering return on investment to IPR owners below market rates; and (4) ultimately increasing costs to consumers of products resulting from standardization efforts. The reason that all of this could result is that the VITA and IEEE-SA policies drive down the cost too fast. As Deputy Assistant Attorney General Masoudi said:

> The same forces that yield the benefits of static efficiency—conditions that encourage rivals quickly to adopt a new business method and drive their production toward marginal cost—can discourage innovation (and thus dynamic efficiency) if the drive toward marginal cost occurs at such an early stage that it pre-

[8] Golden Bridge Tech., Inc . v. Nokia, Inc., 416 F. Supp. 2d 525 (E.D. Tex. 2006).

> vents recoupment of development expenditures, and makes innovation uneconomical.[9]

It would be a tragedy for IPR and antitrust policy if the law were to become a hindrance to innovation rather than an incentive to efficiency.

The legality of joint discussion and negotiation of royalties and whether it is evaluated according to the "rule of reason" rather than the *per se* treatment is under serious debate in the United States and abroad. There still is not enough economic research to support the statements in the Commission report, let alone the statements by the US agencies so far.

In different contexts, the *ex ante* discussion and negotiations could have either pro- or anti-competitive effects. As explained by the Agencies in their *Collaboration Guidelines*:

> Agreements not challenged as *per se* illegal are analyzed under the rule of reason to determine their overall competitive effect. These include agreements of a type that otherwise might be considered *per se* illegal, provided they are reasonably related to, and reasonably necessary to achieve procompetitive benefits from, an efficiency-enhancing integration of economic activity.[10]

This balancing approach appears to be reasonable and is essentially reflected in FTC Chairman Majoras's remarks at Stanford University in 2005, where she explained that "joint *ex ante* royalty discussions that are *reasonably necessary to avoid hold up* do not warrant per se condemnation. Rather, they merit the balancing undertaken in a rule of reason review."[11] A proper balancing must take into consideration the rights of the IPR owners as well as IPR users, and must comport with the goal of efficiency, both static and dynamic.

I again thank my fellow Commissioners for their work and indulgence and hope they find this more detailed background useful.

Separate Statement of Commissioner Jacobson, Joined by Commissioners Valentine (Except as to Part III) and Warden (Except as to Parts I.B and II.B)

It is difficult to overstate the importance of the antitrust laws. By pursuing antitrust, we have established competition as the means of determining market outcomes in the United States. This reliance on the free market has enabled us to avoid the far more intrusive governmental control that has characterized (and often stunted) the economies of other nations. As a result, the United States has developed an economy that is universally admired and respected—with levels of output, price, quality, and variety envied across the globe. Our choice of "antitrust" in 1890 and 1914 has thus proven to be among the best political decisions any country has made. It is a choice now being replicated in substantial part by country after country around the world.

Congress created the Antitrust Modernization Commission against this background. Our assignment has been to study, reexamine, and analyze our existing antitrust regime and to determine whether, and if so to what extent, changes are necessary or desirable. The Commission's Report, which I join enthusiastically in major part, correctly reaffirms the fundamental soundness of the antitrust laws themselves and the procedures for enforcing them. The Commission wisely proposes no changes to any of the most important substantive statutory provisions—sections 1 and 2 of the Sherman Act, sections 3 and 7 of the Clayton Act, and section 5 of the FTC Act. The Commission similarly proposes no radical change to the key mechanisms of enforcement—criminal proceedings; civil proceedings by the DOJ or FTC; private actions for treble damages and injunctive relief; and actions by the various state attorneys general. The changes the Commission recommends are instead designed to enhance, not overturn, the existing structure of antitrust enforcement.

The Commission's key reform proposals warrant the most careful attention by the Congress and the enforcement agencies. Adopting them will improve the quality and character of antitrust enforcement. Particular heed should be paid to the following recommendations:

- Repeal of the anti-consumer Robinson-Patman Act;
- Reform of indirect purchaser litigation;
- Repeal of existing judicial rules forbidding claim reduction and contribution among antitrust defendants;
- Reforming merger clearance and the process for issuing "second requests" under the Hart-Scott-Rodino Act; and
- Narrowing the number and scope of antitrust exemptions and immunities.

I write separately for three reasons: *first*, to underscore my endorsement of the Commission's most significant recommendations; *second*, to address a few important opportunities that the Commission missed; and *third*, to express my specific disagreement on one matter—the Commission's recommendation on criminal sentencing. For the most part, where I have parted company with my colleagues, I have simply noted my disagreement in footnotes to the main Report. The issues addressed here are limited to those warranting more extended comment.

I. Important Facets of the Commission Report

a. No change to the key substantive antitrust laws

The antitrust laws generate enormous benefits for U.S. consumers every day. By stopping cartels, preventing mergers that would create or enhance market power, and forbidding significant restraints of trade and exclusionary practices, the antitrust laws provide for an "unrestrained interaction of competitive forces [that] yield[s] the best allocation of our economic resources, the lowest prices, the highest quality and the greatest material progress, while at the same time providing an environment conducive to the preservation of our democratic political and social institutions." *Northern Pacific Railway Co. v. United States*, 356 U.S. 1, 5 (1958). That famous statement, by Justice Black speaking for the Court almost fifty years ago, remains equally valid today.

If there is any key message to be distilled from the Commission's Report, it is simply that the antitrust laws—both substantively and procedurally—are working well and need not be displaced, rolled back, or overhauled. The Commission had the opportunity to review every aspect of our antitrust system and, in fact, did review major portions. Yet after three years of hard work and analysis, the Commission's proposals for reform, while quite important, are comparatively modest and incremental. That this is such a strong consensus conclusion of the Commission—a Commission incorrectly feared by some, at the time of the Commissioners' appointments, to be antagonistic to antitrust enforcement—is a point of great significance. The Commission's reaffirmation of the basic principles of the antitrust laws and the basic structure of its institutions may well be the single most important aspect of our Report.

Could the Commission have undertaken to comment on additional issues of substantive antitrust law? Certainly, it *could* have. Notwithstanding the general widespread acceptance of antitrust doctrine as a whole, there are many particular court decisions and other interpretations of the antitrust laws that are at least controversial if not outright wrong. In my personal view, the per se rule for tying is an example of a legal doctrine that has long outlived its usefulness. And, to me, the courts should long ago have stricken from the books the holding of *SCM Corp. v. Xerox Corp.*, 645 F.2d 1195 (2d Cir. 1981), which held that a patent acquisition could not violate the antitrust laws if made prior to the time the relevant market for the patented product had emerged. Any list of similar examples would be lengthy.

The temptation for this Commission to address these and other perceived errors of substantive law was substantial. Our decision not to do so, however, was the correct one. A key element of what has made antitrust so successful for so long is its flexibility, its ability to adapt to changes in industrial structure and to changes in legal and economic thought. The statutes themselves establish only broad and simple principles—prohibiting "restraints of trade," "monopolization," and acquisitions that "may lessen competition substantially." These principles have gained real meaning only through the many court decisions, agency actions and guidelines, and economic analyses accumulated over a course of 117 years. As experience in antitrust has demonstrated time and again, however, the received wisdom at any given moment often proves to be quite wrong later on.[1] Any effort to change the substance of antitrust in any kind of permanent way is therefore both perilous and futile.

Antitrust tends to correct its mistakes over time. The per se rule for tying, for example, was sent nearly to its demise just last year. *Illinois Tool Works v. Independent Ink, Inc.*, 126 S. Ct. 1281 (2006). The doctrine of *SCM v. Xerox* is one that, in merger enforcement at least, the federal agencies ignore. *See* ABA Section of Antitrust Law, Antitrust Law Developments 586–88 & n.202 (6th ed. 2007). As this Report is being prepared, the Supreme Court is reexamining one of the most controversial legal rules, the per se rule for resale maintenance. *Leegin Creative Leather Products, Inc. v. PSKS, Inc.*, 127 S. Ct. 763 (2006). In antitrust, there is little to commend any effort to freeze legal precepts in one place. Had the Commission undertaken to devote its attention to the correction of errors in substantive antitrust doctrine, we at best would have provided temporary solutions—and we would have diverted our attention from the many other areas where we have the potential to do real good. Our decision to focus on other matters was the right one.

b. Retention of multiple enforcement

The Commission's recommendations against changing private remedies or the rules that allow federal antitrust suits to be filed by state attorneys general are also important.

The federal antitrust laws are enforced in several ways: (1) proceedings for injunctive relief by the DOJ or FTC; (2) private party actions for injunctive relief and/or damages; (3) actions by state attorneys general for injunctive relief or damages; (4), in appropriate cases, crim-

[1] *Compare* United States v. Arnold, Schwinn & Co., 388 U.S. 365 (1967) *with* Continental T.V., Inc. v. GTE Sylvania Inc., 433 U.S. 36 (1977); *compare* Albrecht v. This list could be expanded exponentially.

inal proceedings by the Justice Department; and (5), perhaps most importantly, by voluntary counseling. It is a fair question to ask whether a system with so many enforcement mechanisms is necessary. History tells us, however, that multiple enforcers are of great importance to the preservation of antitrust, and the free market, as the means for governing our economy.

Multiple enforcement ensures that the administration of the antitrust laws will be not only vigorous but insulated, to a degree, from the vagaries of the electoral process. If antitrust is a priority of a presidential administration, we can be confident of appointees to the Justice Department and Federal Trade Commission who will pursue robust enforcement. But, as we have seen at times over the past 30 years, antitrust is not always an executive branch priority. In some instances, the executive branch may seek to curtail antitrust significantly or, more commonly, to sit on the sidelines while cases are not brought. Multiple enforcers operate as a critical check and balance on the executive branch. In any given case, the federal enforcement agencies may not elect to proceed, but injured parties and the states have the ability to fill in the gap.

It is important to remember that multiple enforcement itself is subject to a critical check and balance: the federal courts. The Justice Department or FTC, in the limited context of pre-merger notification, can prevent consummation of an acquisition for a while—until the parties have complied with the agency's second request—but every other aspect of antitrust enforcement requires judicial intervention. Neither agency can block a merger; only a court can do so. Similarly, the Justice Department can obtain civil or criminal relief only through the courts. The FTC can proceed through its administrative proceedings, but parties can always appeal to a circuit court of appeals. The states and private parties, of course, can proceed only through the courts. The upshot is that, notwithstanding multiple enforcers of the antitrust laws, only the courts can determine whether a violation of law has been established. Having multiple enforcers simply provides greater assurance that the courts have that chance.

Preservation of multiple enforcement is the principal reason why I join the Commission in urging no curtailment of the ability of the state attorneys general to sue under the antitrust laws. The record before the Commission demonstrates convincingly, in my view, that the states can effectively supplement the federal agencies by bringing cases the agencies do not; can team effectively with the federal agencies in bringing important cases; and, by their very presence, provide an important check against federal under-enforcement. *See* Stephen Calkins, *Perspectives on State and Federal Antitrust Enforcement*, 53 DUKE L.J. 673 (2003). The Commission was presented with no evidence demonstrating that state enforcement has resulted in harmful inconsistencies in legal obligations, deterrence of procompetitive conduct, or excessive costs. There was evidence, and I agree, that the *quality* of state enforcement could be improved. But there was simply no case presented to justify curtailing the states' *ability* to enforce the laws.

The Commission's decision to recommend retention of private rights of action for treble damages and injunctive relief is also welcome. There was no serious proposal to eliminate private rights of action entirely, and certainly no evidence to support any such radical change to the basic system of antitrust remedies that has served us well for so long. But a number of thoughtful observers, including some of my fellow Commissioners, have expressed concern about the tripling of damages, at least for non-cartel offenses, in contexts where the defendant's legal obligations are not entirely clear. I remain very sympathetic with those concerns in the abstract. But, nevertheless, I believe that the arguments for change are decisively outweighed by other considerations.

We have had a treble damage remedy for 117 years. It started as section 7 of the Sherman Act; in 1914, it was made section 4 of the Clayton Act. For a statute that has been a cornerstone of antitrust enforcement for that length of time, the burden to show a need for change is a particularly heavy one. The Commission had extensive hearings on the subject. There is extensive literature on the subject, which the Commission reviewed. No commenter identified a single example of a serious injustice occasioned by an actual award of improvident treble damages. That alone is compelling evidence that radical change is unwarranted.

The temptation to limit trebling to particular types of cases is understandable, but ultimately fruitless. To begin with, defining the scope of the limitation is difficult. Limiting trebling to per se (or "hard core") cases is not helpful because the line between per se and rule of reason (or hard core versus non-hard core) is ever-changing and often imperceptible. *See California Dental Ass'n v. FTC*, 526 U.S. 756 (1999). Perhaps more importantly, some of the most serious antitrust violations of all have involved conduct that was neither covert nor per se unlawful. *E.g.*, *MCI Communs. Corp. v. AT&T*, 708 F.2d 1081, 1107 (7th Cir. 1983). Since the only relief available to the government in these cases is prospective, damages remain the only deterrent. Firms will have no incentive to avoid even the most egregious restraints if the maximum penalty is limited to an injunction and single damages. Given the uncertainties within, and the length of time of, litigation, the present expected value of a single damages award will almost always be less than the profits expected to be retained as a result of the violation. Preserving the incentive of injured parties to sue in these cases is therefore of great importance. Moreover, in the litigation process as it exists today, actual recovery of treble damages is something of a myth. With the time lag between injury and recovery, and the general unavailability of prejudgment interest, damage recoveries cannot be expected to exceed the party's actual damages, including cost of capital and associated opportunity costs, even after trebling.

The hurdles today to private recoveries are very steep. The standing and antitrust injury rules have become increasingly strict since *Brunswick* was decided in 1977. *See* ABA Section of Antitrust Law, Antitrust Law Developments 817–28 (6th ed. 2007). Defense summary judgment motions are (correctly) granted vastly more frequently in antitrust cases than in other areas of the law. *E.g.*, *PepsiCo, Inc. v. Coca-Cola Co.*, 315 F.3d 101, 104 (2d

Cir. 2002) (summary judgment "particularly favored" in antitrust litigation). And the cost of launching an antitrust case can be prohibitive. Expert witness costs are unrecoverable, and considerable capital will be tied up in attorneys' fees for years until any recovery is had. As noted, prejudgment interest is unavailable as a practical matter. Given all those factors, trebling, in my judgment, is essential to induce parties to bring cases with merit.

Importantly, moreover, reversing treble damages today would send a terrible public message. We are in an era of diminished federal enforcement of the antitrust laws. The states too have been relatively inactive over the last few years. The key enforcement mechanism today and at other periods in our history has been the private action. We send a very troubling message about our faith in the antitrust laws as the means for guiding our economy if we say we are going to cut back on the treble damages action, the foundation of private enforcement. The Modernization Commission soundly declines to do so.

c. Robinson-Patman Act repeal

The Commission does well to recommend repeal of the Robinson-Patman Act. This statute imposes significant compliance costs on U.S. businesses and, where applicable, operates as a deterrent to price competition. The harm it inflicts on U.S. consumers is great.

The statute today serves little, if any, of the purposes for which it was intended. Although designed to preserve an equal playing field among resellers, the Act is applicable only to commodities. It does not apply, thankfully, to services, and yet services represent a large and growing portion of the economy. Even as to commodities, the statute is easily avoided in ways that harm its intended constituency. So while it is a violation to charge small customer *S* more than huge customer *H* for the same good, it is not a violation to refuse to sell to *S* altogether. The effect, then, is to cause many sellers to refuse to deal with smaller sellers outright, rather than charge them the potentially higher prices that may result from normal competitive interaction in the marketplace. Most small resellers would be better off by having *some* access to the product, albeit at a higher price, than being cut out altogether.

Given the extremely rare nature of proceedings under the statute by enforcement officials; the serious difficulties of enforcing it in private proceedings; the perverse incentives for suppliers it creates; its tendency to inhibit aggressive price competition; and the significant compliance costs it imposes, the Robinson-Patman Act adds no positive value even to its own constituency. The country will benefit if it is repealed.

d. Endorsement of contribution and claim reduction

That a company with, say, 2% of the sales or 1% of the culpability might be responsible for all or substantially all of the damages in a given antitrust case has never made any sense. Yet it is the law of the land. *Texas Industries, Inc. v. Radcliff Materials, Inc.*, 451 U.S. 630 (1981). That is not because of any Supreme Court analysis demonstrating that a ban on contribution is the correct policy choice. It is because of the Court's determination (1) that any policy determination should be made by Congress, and (2) that the outcome of congressional silence should be the purported common law rule, developed ages ago for other contexts, barring contribution among intentional wrongdoers. The combination of these determinations has meant that the no contribution rule exists, not by choice or analysis, but by default. I have long opposed the rule against contribution.[2] The Commission's strong recommendation to propose legislation that will eliminate that rule for cases filed in the future is most welcome.

Predictably, the Commission's recommendation has already generated some opposition. The criticism is that a system of contribution and claim reduction will provide a disincentive to plaintiffs to offer attractive settlements to the "first in" and, in that way, make settlement more difficult generally.

The criticism is easily rejected. To begin with, contribution and claim reduction are the norm in American jurisprudence. Virtually every state permits contribution among joint tortfeasors. *See, e.g.*, Uniform Contribution Among Tortfeasors Act (1955); Restatement (Third) Torts: Apportionment of Liability (2000); Annot., *Contribution Between Tortfeasors*, 17 A.L.R.6th 1 (2006). Contribution is available for many federal causes of actions as well. *See* 15 U.S.C. § 78-u4(f) (securities cases); *Musick, Peeler & Garrett v. Employers Ins.*, 508 U.S. 286 (1993) (10b-5 cases); *Cooper Stevedoring Co. v. Fritz Kopke, Inc.*, 417 U.S. 106 (1974) (admiralty). The types of cases in which no right of contribution exists are rare. Yet the majority of cases settle, and largely at the same rate of frequency that antitrust cases do. Settlements continue to occur—as they will under the Commission proposal—because claims for contribution against defendants who have settled are precluded. *See, e.g.*, Uniform Act § 5; 15 U.S.C. § 78u4(f)(7).

Under the Commission's proposed statute, the only settlements that may be discouraged are those which *should* be discouraged. The problem is at its most acute in massive class action cases, where the potential exposure is already great. In many of these cases, plaintiffs offer settlements early on to one defendant—sometimes the one most culpable or with the greatest sales—that bear little or no relationship to that defendant's actual responsibility. The plaintiffs lose nothing by doing so; the settling defendant's responsibility becomes the problem of those not offered the sweetheart deal. The non-settling defendants may have little or no actual culpability. But they nevertheless are forced into settling by the effect of the enormous exposure they face because the earlier sweetheart settlement arrangements have effectively multiplied their potential liability. This is the kind of process that is unfair on it face and, at the extremes, even gives antitrust enforcement a bad name. Businesses comply with laws they understand and respect; and they tend not to respect laws that appear to be fundamentally unfair. Counseling compliance in the context of a regime that endors-

[2] *See* Jonathan M. Jacobson, *Contribution Among Antitrust Defendants: A Necessary Solution to a Recurring Problem*, 32 U. Fla. L. Rev. 217 (1980).

es this kind of process can therefore be quite difficult. There is no reason that plaintiffs cannot settle early on with defendants for amounts more closely approximating the defendant's portion of the total liability. That is what the Commission proposal will encourage, and it will generate broader respect for (and compliance with) the law.

The reality is that, as has happened in all the many other areas of the law in which contribution and claim reduction have been adopted, plaintiffs and defendants will adapt quickly to the new system and cases will settle as frequently as they did before. The only difference will be that settlements will more closely reflect the responsibility of the settling defendants. That can only be a good thing.

e. Indirect purchaser reform

The burdens imposed by the inconsistency between federal and most states' laws relating to indirect purchaser litigation are considerable. But, as the Commission's Report demonstrates, there is no simple fix to the problems.

The Commission's recommended solution is not perfect. None is. But the Commission solution is one that gives due regard to all of the many constituencies affected. It allows indirect purchasers to sue, but directs them to a forum where the opportunities for inconsistent determinations and excessive or duplicative damages awards are minimized. It avoids preemption of state laws. It maintains consistency with current practice in terms of class certification. It does all this while preventing, as effectively as anyone can, the costly multiplication of proceedings that has characterized indirect purchaser practice over the past twenty years.

The Commission's suggested *Illinois Brick* reform will undoubtedly attract opposition from those with vested interests in the current regime. Indeed, one opposition, by the American Antitrust Institute, has already been posted. The attack is premised on the idea that the Commission proposal would (a) decrease incentives for both direct and indirect purchaser plaintiffs, by reducing overall recoveries to "substantially less than treble," and (b) make class certification more difficult. The first of these criticisms is unfounded. The second is frivolous.[3]

Incentives. Combining direct and indirect purchaser recoveries into a single, consolidated proceeding should not, by itself, reduce incentives for anyone to sue. Nor will consolidation reduce aggregate recoveries. Instead of reducing overall recoveries, the only effect of the Commission proposal should be to *increase* them. There are two reasons why. First, the Commission proposal will expand the universe of potential plaintiffs. Several states today

[3] American Antitrust Institute, Public Comments Submitted to AMC Regarding Indirect Purchaser Recommendation (Mar. 2, 2007). AAI goes so far as to claim that the proposed *Illinois Brick* reform "would in all likelihood eviscerate . . . private enforcement of the antitrust laws." *Id.* at 3. This, and similar statements made throughout, drain the comments of whatever credibility they might otherwise have had.

prohibit any indirect purchaser recovery. The Commission proposal will make recovery available for indirect purchasers throughout the country. Second, many state laws do not provide for trebling or make trebling discretionary. By applying section 4 of the Clayton Act, the Commission proposal, however, will make trebling mandatory.[4]

Increasing recoveries, as a general matter, should equally increase incentives to sue. The concern articulated by AAI, however, seems to be that the lack of certainty as to the amount of pass through would create a disincentive for direct purchasers to sue. I agree that this possibility exists theoretically, but it seems clear that, in the real world, the degree of reduced incentive will be trivial. If direct purchasers are overcharged, the well-organized plaintiffs' bar can still file in every case they do today. Competition to get the "lead counsel" or "executive committee" roles will be as persistent as ever and will encourage cases to be filed. I cannot imagine a single case under the current regime that would not be filed under the Commission's proposed system.

Conversely, the incentives for plaintiffs' lawyers representing indirect purchasers to sue—and to compete for lead counsel and executive committee positions—will only increase. As mentioned, indirect purchaser recoveries will be available throughout the country, rather than state by state, and will be trebled automatically. To the extent there is any diminution of the incentives affecting direct purchaser lawyers, the increase on the indirect purchaser side will more than offset it.

So what will change? Procedurally, of course, there would be a major change in that all proceedings would be consolidated before a single court—reducing litigation costs, and reducing in particular the incentives for some plaintiffs' lawyers to use procedural cost and complexity as a device for inducing settlements that would otherwise be unavailable. In addition, if the Commission's solution is adopted, then, in most cases, the proceedings that do not settle quickly should resemble an interpleader case; the aggregate overcharge would be determined first, with the allocation between direct and indirect purchasers to follow. That would allow the plaintiffs' groups to work together in the first phase of the case to maximize the total recovery. If they are as successful as I suspect they will be, then total damages recovered should be roughly the same as they are today. However, the ability of plaintiffs' lawyers to use the uncertainty in some states' laws to suggest that duplicative damages can be achieved will be eliminated. And the system we see today, with a different

[4] AAI seems to be under the impression that the system today permits multiple and duplicative recoveries, and that these would be eliminated under the Commission proposal. Apart from the basic point that duplicative recoveries are something to be avoided, not encouraged, even the underlying premise appears to be wrong. Those states to address the issue have concluded—some by express statutory provision—that multiple recoveries should be avoided, thus limiting damages overall to the specified multiple of the overcharge in issue. *See In re Vitamins Antitrust Litigation*, 259 F. Supp. 2d. 1, 3 & n.1 (D.D.C. 2003) ("First, of the twenty repealer jurisdictions, the majority (twelve) either allow a pass through defense or prohibit double recovery . . . . Of the [remaining] eight jurisdictions . . . no jurisdiction *expressly prohibits* a pass through defense.") (emphasis added).

set of plaintiffs' lawyers in each indirect purchaser state tacking their name onto a pleading and then seeking fees, will disappear. Direct plaintiffs' lawyers will have to reach settlements on the basis of their clients' actual treble damages, and indirect plaintiffs' lawyers will have to do the same. If their assessments vary enough from the defendants', the cases may have to be tried—something that never happens today because of the undue leverage that the procedural complexity provides. Outcomes based on the merits of a case are ones the law should encourage.

Class certification. The class certification objection to the Commission's proposal is nonsense. The proposal clearly states that class certification standards and procedures will remain as they are today, and that the introduction of pass-on—already an issue today in indirect purchaser class certification—will have *no effect* on the certification of direct purchaser classes.

Summary. Direct and indirect purchaser litigation today all too closely resembles both a roulette wheel and a "protection" scheme. The criticisms the AAI levels at the Commission proposal would perpetuate that impropriety. Reform is essential to place purchaser litigation on a footing where the merits count.

If enacted by Congress, the Commission's indirect purchaser recommendation will stand as a major accomplishment. There will undoubtedly be some sincere opposition to parts of the recommendation as the legislative process moves forward. I strongly urge Congress to view the recommendation as a whole, and to weigh it against the many alternatives—including the option of doing nothing. With careful review and consideration, I believe the Congress will see that this is a most elegant and practical solution to a very difficult problem.

II. Missed Opportunities

There are some opportunities for improvement in the law that the Commission unfortunately missed. The most important of these from my perspective are (1) our failure to advance recommendations for the immediate repeal of specific exemptions, and (2) our failure to endorse consumer (versus total) welfare as the touchstone for analysis of efficiency claims.

a. Exemptions

Our economy has moved significantly away from regulation and towards competition over the past 30 years, and consumers have reaped substantial benefits. Yet the economy remains riddled with exemptions allowing cartel behavior in many markets without any corresponding economic justification. The Commission's Report explains this point effectively.

The Commission, however, does not make any specific recommendations for the repeal of particular exemptions. This is in large part attributable to lack of time. The Commission elected to review 30 separate issues of law and policy (see Commission Memorandum, *Issues Selected for Study* (Jan. 2005), *available at* www.amc.gov/pdf/meetings/study_issues.pdf), many of which standing alone were extraordinarily broad. I believed then, and believe now, that we could and should have selected a much narrower set of issues than we did. Had we done so, we could have focused more time and energy on discrete and identifiable problems warranting legislative correction—including specific exemptions—than we in fact were able to do.

The Commission did hold some specific hearings on exemptions, addressing the McCarran-Ferguson insurance exemption, the Shipping Act, the Export Trading Act, and the Webb-Pomerene Act. Sufficient evidence was presented at those hearings, in my view, and sufficient independent analysis strongly confirms, that these exemptions have outlived any utility they may have had and should be repealed. At each hearing, the Commission was presented with substantial evidence of anticompetitive activities the exemptions do or can permit. And, in each case, the response was basically the same—that "our industry does many good things, does not restrain competition, and needs the exemption to avoid potential treble damage litigation." This litany provides no basis for an exemption. Virtually *every* industry does good things. Conduct that does not restrain competition is *not* prohibited, with or without an exemption. And freedom from private litigation is something, again, that *every* industry would like. If these were valid bases for an exemption, there would be immunities from the antitrust laws everywhere. The real question in each case is whether the application of normal antitrust rules will impair some important public goal, and whether an exemption is truly necessary to ensure that this goal is served. None of the industries we examined came close to meeting that standard of proof.

In my view, the Commission would have better served the country through a more focused review of these four and other widely applicable exemptions (such as the Capper-Volstead Act) than by relying purely on the generalist overview reflected in our official recommendations.

b. Consumer versus total welfare

The history of antitrust law demonstrates a longstanding commitment to a legal standard that promotes the welfare of consumers as antitrust law's primary goal. The Supreme Court's antitrust jurisprudence of the modern era has been consistent with the consumer welfare approach.[5]

The Commission correctly chose not to revisit the settled primacy of the consumer welfare standard generally. We did, however, by a divided vote, choose to evaluate the standard in the narrow context of merger efficiencies. Specifically, we asked, should efficiencies that benefit only the parties, with no prospect of being passed along to consumers, be counted

[5] *See* Robert H. Lande, *Proving the Obvious: the Antitrust Laws Were Passed to Protect Consumers (not Just to Increase Efficiency)*, 50 Hastings L.J. 959 (1999) (citing authorities); Robert H. Lande, *Wealth Transfers as the Original and Primary Concern of Antitrust*, 34 Hastings L.J. 65 (1982).

in favor of a merger? Or, as the *Merger Guidelines* say, should efficiencies matter only in circumstances where consumers are likely to benefit from the cost savings the parties achieve? *See* U.S. Dep't of Justice & Federal Trade Comm'n, Revision to Section 4 of Horizontal Merger Guidelines (Apr. 10, 1997); *see also* Steven C. Salop, *What is the Real and Proper Antitrust Welfare Standard?*, Comments Submitted to AMC, Nov. 4, 2005, at 1.[6]

The Commission, surprisingly, was unable to reach a consensus on this issue. Although several Commissioners supported the consumer welfare standard reflected in the *Guidelines*, a majority to support that view in the Report could not be mustered. That is another missed opportunity. Any doubts that a consumer welfare standard better reflects the goals of the antitrust laws than a standard based on total welfare will serve only to undermine antitrust enforcement in the future.

The fundamental problem with the total welfare standard is that, by definition, it gives equal weight to the impacts of the conduct on all constituencies, including producers and competitors. By declining to focus on the effects on consumers, as the consumer welfare approach does, the total welfare standard encourages practices that transfer wealth from consumers to producers, as well as practices that benefit competitors at consumers' expense. Application of the total welfare standard, for example, would permit "a merger to monopoly that permits the merged firm to reduce costs significantly but also endows the selling firm with the ability and incentive to raise its price above the pre-merger level." *Id.* at 2. The gains to the merging firms would have to be balanced against the losses to consumers from post-merger monopoly prices and, if the benefits to the merging firms are larger, the merger would have to be allowed. Worse, because the total welfare standard protects the interests of competitors with equal vigor as the interests of consumers, a faithful application of the standard would forbid a merger that yielded cost savings that were passed onto consumers but that also harmed rivals of the merging firms by some greater amount. The net total welfare effect of such a merger would be negative because of the harm to the rivals, and a merger beneficial to consumers would have to be condemned.

Proponents of the total welfare standard do so either by ignoring these points or by making ad hoc exceptions to avoid the perverse results the standard generates. But a standard that is applied with exceptions to its basic structure is no standard at all. It is the equivalent of allowing decisions to be based on little more than the decisionmaker's whim.

The concern of at least some of the Commissioners who declined to support the consumer welfare standard appears to have been that a consumer welfare standard does not

[6] As Professor Salop explains: "The aggregate economic welfare standard would condemn conduct if it decreases the aggregate welfare of consumers (i.e., buyers) plus producers (i.e., sellers plus competitors), without regard to any wealth transfers. In contrast, the true consumer welfare standard would condemn conduct if it actually reduces the welfare of buyers, irrespective of its impact on sellers. Efficiency benefits count under the true consumer welfare standard, but only if there is evidence that enough of the efficiency benefits would be passed-through to consumers so that consumers (i.e., the buyers) would benefit from the conduct."

credit fixed cost savings that do not immediately reduce marginal or variable costs. That is a valid concern but, in this case, misdirected. The agencies have made clear that fixed cost savings will be considered under appropriate circumstances:

> [U]nder certain market or sales circumstances, fixed-cost savings may result in lower prices in the short term. Selling prices that are determined on a "cost-plus basis" (e.g., cost-based contracts) can be influenced by changes in fixed costs. Contractual arrangements also may allow fixed-cost savings to be passed through.
>
> The Agencies consider merger-specific, cognizable reductions in fixed costs, even if they cannot be expected to result in direct, short-term, procompetitive price effects because consumers may benefit from them over the longer term even if not immediately.

U.S. Dep't of Justice and Federal Trade Commission, Commentary on the Horizontal Merger Guidelines 57–59 (2006). Thus, if a market is competitive, fixed cost savings will reduce the merged firm's total costs and will tend to be passed along to consumers. If the savings are likely to be passed along within a reasonable period of time, sound application of the consumer welfare standard will count them. If, however, it will take years for consumers to see any benefit from particular fixed cost savings, or if the merger makes the market significantly less competitive, it is fair to conclude that the claimed benefit is sufficiently speculative and doubtful to warrant exclusion or minimization in the final analysis. The enforcement agencies recognize this point and, in practice, are applying a standard that accommodates legitimate efficiency concerns.

The total welfare standard has nothing to commend it. No sound antitrust policy would forbid a merger that benefits consumers because it also harms rivals. Nor would any sound policy permit a merger to monopoly that yields benefits only to the merging parties. Having undertaken to address this issue, the Commission should have endorsed the consumer welfare standard for evaluating efficiency claims in clear and unmistakable terms.

III. One Unfortunate Error: The Continued Use of § 3571(d) for Corporate Fines

The Commission has erred, I believe, in failing to recommend changes to our regime of corporate fines in criminal cases.

Few would disagree with the basic proposition that effective criminal enforcement is central to the administration of the antitrust laws, and that a system of formidable corporate fines is essential to the accomplishment of that objective. And few would disagree that the Justice Department has assembled a marvelous track record in criminal enforcement over the last several decades, especially in recent years following the Antitrust Division's revision of its corporate and individual leniency policies. Dozens of individuals have served time in prison for their crimes, and dozens of cartels, including several significant international cartels, have been shut down through the Division's efforts.

One of the most reported measures of the Division's success has been the level of corporate fines. In fiscal 2004 through fiscal 2006, the Division obtained in fines, respectively, $350 million, $338 million, and $473 million. *See* Criminal Antitrust Fines, *available at* www.usdoj.gov/atr/public/press_releases/2006/220465a.pdf. Over the past dozen years, corporate fines exceeding $100 million to single companies have been obtained in at least seven instances, including the $500 million fine assessed against Hoffmann-LaRoche in the *Vitamins* case. *See* ABA Section of Antitrust Law, Antitrust Law Developments 785 & n.332 (6th ed. 2007). This is a particularly impressive record given that the applicable maximum fine in each of these cases under section 1 of the Sherman Act was just $10 million. (The 2004 amendment increasing the fine to $100 million was inapplicable in these cases; it applies only to conduct occurring after its effective date.) These fines have been assessed through guilty pleas, reached by applying *Sentencing Guidelines* methodology using the alternative fines statute, 18 U.S.C. § 3571(d), which allows for fines up to double the gain or loss from a given offense.

The difficulty with the current regime is that it violates the Due Process Clause of the Fifth Amendment. Due process requires that all elements of a crime that affect the level of sentence be proven beyond a reasonable doubt. *United States v. Booker*, 543 U.S. 220 (2005); *Blakely v. Washington*, 542 U.S. 296 (2004); *Apprendi v. New Jersey*, 530 U.S. 466 (2000). Any fine greater than $100 million (formerly $10 million) must therefore be supported by proof, beyond a reasonable doubt, of a gain or loss sufficient to justify the fine. But proof of the amount of gain or loss—in most cases, the amount of overcharge—is extremely difficult in *any* antitrust case. Typically, the proof involves dueling experts reaching reasoned but diametrically opposite conclusions. That is problem enough in civil cases, where damages must be proven by a preponderance of the evidence. In criminal cases—absent the most extraordinary circumstances—proving gain or loss *beyond a reasonable doubt* is essentially impossible, at least without reducing the fine sought to an extremely low number.

So how is the Justice Department routinely getting companies willing to pay fines in excess of $10 million (now $100 million) without apparent difficulty? The answer is that companies have no real choice but to agree. The Antitrust Division has made very clear that it "will not engage in plea negotiations with a defendant that desires to litigate gain or loss." Scott D. Hammond, *Antitrust Sentencing in the Post-*Booker *Era* 10 (Mar. 30, 2005). The Division says: "If a defendant wants to contest gain or loss, it "will have to wait until the end of the investigation for its day in court. . . . Not only will the company go to the end of the line, but so will its executives, unless they desire to approach the Division on their own and negotiate separately with the Division, which will obviously strengthen the Division's case against the company." *Id.* The Division recognizes the impact of this policy in actual practice: "[M]any companies are likely to continue to forgo the litigation of gain or loss because of the many positive consequences resulting from early cooperation, such as fine reductions, non-prosecution coverage for some executives and favorable plea agreements for others, and possible limitations in the scope of the charged offense or attributable commerce." *Id.*[7]

It appears, in fact, that every company faced with a Justice Department demand for a fine in excess of the Sherman Act § 1 amount based on the double the gain or loss provision of section 3571(d) has given up and paid the fine. Given the leverage that the Justice Department wields in these matters, a litigated legal challenge to a 3571(d) antitrust fine by anyone could be many years away. The issue, therefore, is not one that the Commission should wait for the courts to resolve. If there is a problem—and there is—it should be addressed now. The Commission may be the only practical forum to recommend correction.

There can be little doubt that the continued routine insistence of fines based on double the gain or loss violates the Due Process Clause. In the vast majority of the past cases, perhaps all, there was no plausible expectation that gain or loss at any level close to the relevant fine amount could be proven beyond a reasonable doubt. To continue to support a regime of this sort is to express contempt for Due Process or, just as bad, knowingly to look the other way.

The fix, moreover, is easy. Fines calculated by a judge under the *Sentencing Guidelines* (on an advisory basis) are entirely constitutional provided that the fine amount is within the range established by the underlying statute. The problem, therefore, can be solved simply by raising the maximum fine under Sherman Act § 1 substantially, say to $500 million. The only objection advanced for not making that recommendation is that Congress just raised the amount in 2004 and it is therefore "too soon" to ask again. Nonsense. The current fines administration routinely violates the Constitution. Placing it on a footing that assure compliance with the Due Process Clause will only breed greater respect for the law—and is well worthy of congressional time.

We should recommend repeal of section 3571(d) insofar as it relates to antitrust crimes and, simultaneously, seek to amend section 1 of the Sherman Act to permit fines of up to $500 million.

Conclusion

The Antitrust Modernization Commission has now responded, in this Report, to the congressional request for counsel on the administration of the antitrust laws. The overwhelming majority of the Report expresses recommendations and conclusions with which I agree wholeheartedly.

[7] Others put it more starkly, saying that "the Division's enforcement approach appears to be a willingness to trade people (particularly senior executives) for money." Tefft W. Smith, Statement at AMC Criminal Remedies Hearing, at 5 (Nov. 3, 2005). I personally doubt that the Division is intentionally trading senior executive jail time for companies' concessions to a higher fine, but it is indisputable that any company faced with a large and likely unconstitutional fine amount must weigh the negative of agreeing to that fine against the positive of keeping key executives out of jail.

It has been a great personal honor to have participated in the Commission's work over the past three years and to have done so with such an impressive array of distinguished fellow Commissioners. Considerable thanks go to our Chair, Deborah Garza, for her tireless efforts in leading the Commission's efforts.

I also want to thank our staff: Andrew Heimert, Susan DeSanti, Bill Adkinson, Nadine Jones, Marni Karlin, and former staffer Todd Anderson; advisors Andy Gavil, Michael Klass, and Alan Meese, and former advisor (now FTC Commissioner) Bill Kovacic; and Hiram Andrews, Kristen Gorzelany, Christopher Bryan, and Sylvia Boone. You have been a wonderful team.

Separate Statement of Commissioner Kempf

I join—enthusiastically—in the vast majority of the Commission's recommendations. I write this separate statement to discuss those few areas where I do not join in recommendations and to expand on my views as to a few other matters. In so commenting, I do not wish to distract from or diminish the significance of the Commission's principal recommendations. They were fashioned on the anvil of rigorous discussion and debate—a process in which all of the Commissioners fully participated. In my view, a number of the recommendations are quite exciting and truly momentous. These include, for example, (1) repeal of the Robinson-Patman Act that is so harmful to consumers, (2) a rational and sensible approach to direct and indirect purchaser claims in price-fixing cases, and (3) some excellent suggestions to the agencies as to steps they should consider—both domestically and around the globe—to simplify the merger reporting process and to speed up coming to a decision on whether to clear or challenge a proposed merger.

Before turning to a discussion of the Commission's recommendations and report, I want to emphasize at the outset that serving on the Commission turned out to be a genuine pleasure for me. Before we began to meet, I wasn't so sure that that would be the case. I was concerned that, with six Republican appointees and six Democrat appointees, the Commission's proceedings might mirror the partisanship that Americans have come to see on TV regularly in certain other government activities. That never happened. Quite the contrary, the Commissioners—all of them—worked together cooperatively and collegially to try to do the best individual and collective jobs they could. Thus, I was able to work to fashion sensible consensus positions on difficult issues not only with Commissioners Garza, Burchfield and other fellow Republican appointees, but also with Commissioners Jacobson, Yarowsky and other Democrat appointees.

There were substantive differences among members of the Commission from time to time, to be sure, and some of those are discussed in what follows. During our three years working together, however, all of our proceedings took place in a spirit of good fellowship. At every turn, Commissioners listened to each other carefully and respectfully in an effort to come up with the best possible recommendations to the President and Congress that we possibly could. I came away from the experience with the greatest respect possible for my fellow Commissioners.

Below, after first addressing the two areas where my views may vary significantly from those of some of my fellow Commissioners (mergers and exemptions/immunities), I will discuss briefly several other matters on which I want to comment beyond what appears with respect to my individual views in the footnotes to the recommendations.

Mergers. I agree with and join most of the Commission's recommendations in the merger field—both substantive and procedural. Nonetheless, it is in the merger area that I depart the most and the most seriously from my fellow Commissioners. According to them, when it comes to antitrust and mergers, almost everything is hunky dory. As they see it, for example, "the basic framework for analyzing mergers followed by the U.S. enforcement agencies and courts is sound." I don't think so—at least as to the agencies.

The Merger Guidelines. To me, the "basic framework" used by the agencies—as articulated by them in their *Merger Guidelines*—is fundamentally flawed. Forty years after their initial appearance in 1968, the *Merger Guidelines* remain bottomed on a "basic framework" that is analytically bankrupt. They lack intellectual respectability, and they have for a long time. *See, for example*, H. Goldschmid, et al., eds., INDUSTRIAL CONCENTRATION: THE NEW LEARNING (Little Brown & Co. 1974).

The bedrock for today's version of the *Merger Guidelines*, as it was for the original version back in 1968, is concentration data. From the outset—and today—the *Merger Guidelines* have rested on the erroneous notion that increasing concentration leads to decreasing competition. That may be true when two firms merge to monopoly. Short of that, however, most increases in concentration lead to an increase in competition, not a decrease. The reason for that, of course, is that the concentration-increasing mergers result in cost-saving efficiencies that enable the combined firms to lower prices, increase quality and improve service. That is why opposition to such mergers usually comes from the combining firms' competitors, not from their customers.

When all this was discussed at Commission hearings and meetings, my colleagues on the Commission didn't disagree with me so much as they said, in effect, that the agencies don't really follow their *Guidelines* and that experienced legal and economic practitioners in the merger area know this and can so advise their clients. Those "in the know," for example, can tell their clients that a merger that increases the HHI by 150 points and results in an industry HHI of 2000, far from being likely to create or enhance market power or facilitate its exercise, is likely in a safe harbor with no real prospect of attack. And so on.

Maybe I'm just too old fashioned, but I've always thought that *Guidelines* should give guidance, not disinformation. In any field. For anyone who is not a schooled aficionado of antitrust, the *Merger Guidelines* are a misleading trap for the unwary. Were plain old business people to read them and take them at face value, they would be deterred from pursuing pro-competitive transactions that would benefit consumers. That is a sad state of affairs. The mitigating circumstance is that, in fact, most business people, instead of looking to the *Guidelines* for guidance, are forced to hire an army of advisors (a regiment of lawyers, a battalion of economists, a squad of psychics and so forth) who can tell them that the *Merger Guidelines* are not to be taken seriously when it comes to concentration data. These advisors will comfort their clients by telling them of combinations that resulted in astronomical increases in concentration and yet were accomplished without antitrust challenge—as was true, for example, in the case of Whirlpool's acquisition of Maytag (where some said post-merger HHIs were close to 6000 and jumped by more than 2000 points as a result of the merger—*see* D. Moss, *Antitrust Analysis of the Whirlpool's Proposed Acquisition of Maytag* (January 17, 2006); http://www.antitrustinstitute.org/archives/files/477.pdf). They will tell their clients that a host of "other factors" that relate to the real world will always trump the concentration data benchmarks set forth in the *Guidelines*, if those factors demonstrate that the transaction will increase rather that decrease competition (as they did in the case of Whirlpool-Maytag—*see* DOJ Press Release, "Statement on the Closing of Its Investigation of Whirlpool's Acquisition of Maytag" (March 29, 2006); http://www.usdoj.gov/atr/public/press_releases/2006/215326.htm.).

The development of sound merger policy, in my view, has not been led by the agencies, but rather by the courts. The Supreme Court's landmark decision in *United States v. General Dynamics Corp.*, 415 U.S. 486 (1974), completely recast the "basic framework" for analyzing mergers—despite opposition from the agencies. *See generally*, D. Kempf, *Merger Litigation: From the Birth of General Dynamics to the Death of Section 7*, 65 Antitrust L.J. 564 (1997). Before that, at the urging of the agencies, efficiencies were ignored (or worse) and wrong-headed concentration data ruled the day. Since then, the courts have been in the vanguard of constructive further development of the law—mainly in court decisions rejecting agency challenges to competitively beneficial (or benign) mergers. As a result, there has been continual and substantial progress toward an ever more sound merger policy. One thing that has helped in this regard is that the courts, early on, recognized that the *Merger Guidelines* aren't law and aren't binding on the courts. So the courts ignore the *Guidelines* when they are at odds with the court's own analysis or cite the *Guidelines* when they support it. Thanks to the courts, merger policy today is better than it has been in 100 years. In this context, to paraphrase the line from *The Treasure of the Sierra Madre*, "We don't need no stinking *Guidelines*."

For one thing, as discussed above, the *Merger Guidelines* decidedly do not provide useful guidance. No one really disputes this. Instead, antitrust practitioners say things like "Well, maybe not, but the *Guidelines*, taken together with speeches by agency personnel, enforcement actions, economic studies and the advice of economic experts and experienced antitrust practitioners does provide useful guidance." That may be true, but it is no real answer to the deficiencies of the *Guidelines* themselves when it comes to giving guidance. It does not reflect well on the agencies when the first thing an experienced practitioner will tell his client is that the client *should not* look to the *Guidelines* for guidance. The *Merger Guidelines* should be withdrawn or substantially revised. I favor the former—in part because I fear further efforts to tinker with the *Guidelines* are more likely to make them worse than better. And the army of advisors that is now *de rigueur* doesn't need them.

Efficiencies. Even though there has already been a genuine sea-change in the role efficiencies play in merger analysis, much room remains for further improvement. In the "bad old days," efficiencies were viewed as a reason to attack a merger under Section 7. Indeed, the then-prevailing view was that the greater the efficiencies the greater the need to attack the merger. The merged firms, with their increased efficiencies, could charge lower prices that other competitors could not meet and, because of that, the other competitors would be driven out of business. This approach elevates the façade of competition over the reality of competition. It preserves the "appearance" of vigorous competition that purportedly results from having a whole bunch of small competitors scurrying about in the marketplace. Never mind that they are inefficient and can survive only by charging high prices to consumers. This is the mind-set of those who equate the number of competitors (and, thus, level of concentration) with the intensity of competition. It is the thinking behind the original merger guidelines published in 1968: more competitors equals more competition. That's the *façade of competition. Real competition*—and increased competition—results from this: mergers that lead to fewer, but more efficient, competitors that charge consumers lower prices. You need a sufficient number of competitors, of course, to ensure there won't be monopoly pricing. But that number is not very large.

The good news is that the agencies no longer view efficiencies negatively. But embracing efficiencies as a positive rather than negative competitive factor has come slowly—and begrudgingly at times. And agency analysis is still not totally sound. The agencies, for example, require that the gains from efficiencies be "passed on" to consumers before the agencies will "count" them as a positive factor. That sounds noble and egalitarian, of course: "Why should the fat-cats get to keep the gains; pass them on to the little guy." But it makes no sense. Efficiency gains eliminate dead-weight loss and are always a plus for society—whatever is done with them. And the management of the merged firm will know far better than a bunch of bureaucrats what best to do with the efficiency gains. Management could decide that, instead of passing them on in the form of lower prices in the short run, it will invest the gains in de-bottlenecking production facilities or perhaps even building a completely new, more efficient plant—in either case leading to even lower prices in the long run than would result from a pass-on. Or they might decide to go into a new line of products, resulting in increased competition there as well. Suppose, for example, that management had a project that gave real promise of developing a cure for cancer. Do we really want to tell management that it can't pursue that project because we want the money passed on to widget consumers instead? I don't think so. Let's take the most extreme example. Suppose management says, "Hey, we just want to give the gains to our shareholders in the form of increased dividends." Does it make sense for antitrust enforcers to say "No can do."? Again, I think not. Shareholders also go by another name: consumers. Hello. Should that set of consumers—the consumers who, incidentally invested their capital to own the company—be told that they can't have the money because the government insists that another set of consumers get it instead?

In terms of antitrust lingo, the issue is framed as one of "consumer welfare" versus "total welfare." In reality, of course, total welfare always translates into consumer welfare in the long run. To the extent that "consumer welfare" is a proxy for things like "pass on," it should be rejected as counterproductive and anticompetitive officious intermeddling.

Notwithstanding my criticisms, the fact is that (as I said at the outset) much progress has been made in moving toward a proper analytical approach to analyzing efficiencies in the merger context. I am hopeful that, before too much more time goes by, efficiencies will be—as they should be—fully and properly taken into account in merger analysis.

Publishing enforcement statistics. The reason I don't join in the recommendation that the agencies publish more statistics on merger enforcement is that I fear that doing so will create an irresistible temptation for agencies to bring ill-considered enforcement actions in order to "improve" their statistical score-card. Such data has been misused in the past with some frequency to complain of "under enforcement" or to trumpet "rigorous enforcement." During Bill Baxter's time at the Antitrust Division, for example, there was a significant increase in cases under Section 1 challenging price-fixing. At the same time, Baxter put an end to the steady stream of improvident merger and monopolization cases that had characterized prior enforcement activities. He was routinely lambasted by some for being "lax" in antitrust enforcement. One of his successors, with an eye to the numbers, brought lots of cases that were routinely settled with a consent decree. At the time, I characterized this as "the McDonald's approach to vigorous antitrust enforcement"—"the government wants its quarter-pound of flesh." D. Kempf, *Antitrust Law Developments*, 33rd Annual Northwestern Corporate Counsel Institute (October 13, 1994). I told the business group to whom I was speaking that this approach had good news and bad news for them. The bad news was that many mergers that were competitively benign still would likely require a consent decree to close—another notch in the antitrust enforcement gun. The good news was that mergers with serious anticompetitive implications would also be permitted to close—so long as the closing was accompanied by an acceptable consent decree—and ever more robust (albeit nonsensical) enforcement statistics.

Updating the Merger Guidelines to cover innovation and non-horizontal mergers. This strikes me as a bad idea. The most likely outcome would be "innovation" in fuzzy merger-enforcement theories. The role of innovation will develop better if it is done in the context of actual cases—with the assistance of the courts if need be. As for non-horizontal mergers, those are almost never challenged. For good reason. An effort to "explain" this carries with it the temptation to fashion "creative" new theories as to when such mergers can be anticompetitive and should be challenged. Again, it would be better to leave well enough alone and let "guidance," to the extent it is needed at all, develop in the context of actual proposed transactions and, also again, with the assistance of the courts if need be.

The HSR Act. The sky was not falling before the HSR Act became law, and HSR was not, as the report seems to suggest, the greatest thing since sliced bread. To the contrary, the

HSR Act, at least at the time it was passed, was viewed as simply something that would make it a little easier for the agencies to get a preliminary injunction blocking a prospective anticompetitive merger. Thus, as noted in the report, the stated purpose of the HSR Act at the time it was passed was just "to provide advance notification . . . of very large mergers" and "to improve procedures to facilitate enjoining illegal mergers before they [were] consummated."

As things have turned out, however, HSR has had a quite different effect on merger enforcement. To begin, it appears to have made it *harder* for the agencies to get a PI in merger cases. Before the passage of HSR, the government sought to enjoin mergers far more that it does today. Not only that, but the government almost always got a PI blocking a merger when it sought one. Indeed, as Justice Stewart observed in *Von's*, "The sole consistency that I can find is that in litigation under [Section] 7, the Government always wins." *United States v. Von's Grocery Co.*, 384 U.S. 270, 301 (1966). That's not true anymore. Now the government loses merger cases with a fair degree of regularity. In my view, the way that HSR proceedings have evolved over time is one of the reasons for that.

As originally envisioned, there was to be a three-step HSR process—(1) a 30-day waiting period after notification of the proposed merger was provided to give to the enforcement agencies time to review it; (2) if an agency wanted any additional information to help it decide whether or not seek a PI blocking the merger during the pendency of a case it would bring on the merits, it could make a "second request" for more information; and (3) there would be a very short second waiting period (20 days) after substantial compliance with the second request during which the agency could decide whether or not to bring a PI action seeking to block the proposed merger. That dream has long since vanished.

As the report notes, second requests have become draconian in nature (compliance with a second request now "typically takes six months and costs $5 million"), and "the reviews in more complex investigations can take eighteen months and cost the merging parities up to $20 million." Moreover, the HSR phase, instead of merely a way to assist in the PI process, has become the whole ball game when it comes to merger enforcement. The agency doesn't seek *limited* information to assist it in deciding whether or not to seek a PI but rather *comprehensive* information that, absent clearance, it can use either in a consent decree negotiation or in a full-scale assault on the transaction. And one of the Commission's recommendations (in which I did not join) urges Congress to drive the nail in the coffin by precluding the FTC from even pursuing a Section 7 case against a merger once the agency has failed in an effort to get a PI.

Given the changes that have occurred under HSR compared to what was originally envisioned, I have mixed feelings about the Commission's recommendation that the FTC be barred from bringing an administrative complaint challenging a merger where it has sought to get a PI blocking the transaction but failed in that effort. As the system now operates, I favor the recommendation. But I don't like the way the system now operates. I would prefer that the focus of the HSR proceedings return to being a relatively quick and simple exercise by the agency to decide whether or not it will seek a PI to block the transaction during the pendency of a case on the merits—with the FTC using its authority to combine the PI proceeding with its case on the merits in appropriate cases (as the DOJ routinely does). As now-Justice Ginsburg emphasized in *FTC v. Weyerhaeuser Co.*, 665 F.2d 1072, 1083 (D.C. Cir. 1981), the district court's ruling in a PI case "must be made under time pressure and on incomplete evidence" and "the risk of an erroneous assessment is therefore higher than it is after a full evidentiary presentation." In that context, a subsequent FTC administrative proceeding should not be barred. (Indeed, the *Weyerhaeuser* case itself came to reflect the wisdom of this approach. There, the district court thought the transaction was likely anticompetitive, but let it close and proceed to an administrative trial on the merits because of powerful "equities" considerations. At that trial, an FTC ALJ determined that the merger was not anticompetitive—a decision that was affirmed on appeal by the full Commission.)

In short, what I would prefer to a one-bite-at-the-apple rule for the FTC or DOJ is a return to fast-track HSR review, followed by an expeditious PI proceeding and, if needed, a full trial on the merits. I find it disgraceful that HSR proceedings currently drag on as long as they do. My hunch is that, under a fast-track regime, just as many consent decrees would be entered into as is now the case. It would just be done faster, cheaper and better. If I had my druthers, I would urge Congress to take steps to get the HSR procedure back to what was originally intended. No more calls from agencies to parties wishing to merge saying "We can make a decision now if you force us to do so, but it may not be in your interest for us to do that. How about, instead, extending the waiting period so that we can continue our review of the transaction?" Usually (though not always), the temptation to do so proves irresistible to the business people. Then, unfortunately (and increasingly), things just seem to drag on forever.

Exemptions and immunities. The antitrust laws suffer from Rodney Dangerfield Syndrome: they get "no respect." Or at least they don't get the respect they should.

There is a reason for this, of course. Citizens don't think that something is truly "evil" when lots of people are expressly authorized to do it. People see massive price-fixing every day by their friends and neighbors—all perfectly legal, because it is done pursuant to some immunity or exemption that excludes those particular price-fixing activities from the reach of the antitrust laws. So when people learn that yet another friend or neighbor has also engaged in price-fixing (but without the benefit of an exemption or immunity), they don't seem to think it is so "bad." After all, every one else does it, and they don't get into trouble. So why should Joe?

I sometimes tell the story of two brothers who successfully engage in price-fixing—one of dairy-farm products and the other of dairy-farm implements. When it all comes to light, one brother is named Farmer-of-the-Year, has his picture on the cover of *Iowa Gazette* and goes to a big dinner in his honor in a black tux, while the other brother is named Felon-of-the-Year, has his picture on the cover of *Police Gazette* and goes to the big house in an orange prison suit. (*See* addendum, *A Tale of Two Guys*)

What I take from this unfortunate state of affairs is that exemptions and immunities from the antitrust laws have a double-barreled adverse effect. First, they countenance anticompetitive activity that adversely affects consumers. Second, they breed disrespect for laws generally and for the antitrust laws in particular.

Nearly everyone—including the Antitrust Modernization Commission—waxes on about how antitrust exemptions and immunities are not a good idea, should seldom be granted and, when they are, should be reviewed frequently thereafter to see if the time is ripe to get rid of them. I certainly join in the Commission's principal recommendations in this regard. But you have to wonder how serious it all is. If exemptions and immunities are such a bad idea, how come we have so many of them? And why do they seem to persist in perpetuity? Something doesn't quite square.

Perhaps most revealing is the shape of the discussion when it turns to the subject of which particular antitrust exemptions and immunities should be eliminated. There is a lot of support for eliminating those that are inconsequential, but there is little support for eliminating those whose adverse competitive impact is greatest. In fact, there is little appetite even to discuss the subject.

And so it was with the Commission. Early on, there was talk at Commission meetings/hearings about how maybe we should consider recommending to Congress that it get rid of things like the baseball exemption and the Webb-Pomerene Act. But the impact of those exemptions on the average American doesn't amount to a hill of beans. Baseball is so afraid of losing its antitrust exemption that it conducts it affairs as if it didn't have one to start with. Thus, in baseball, as in other sports, there is free-agency for players, mobility for teams, etc. As for Webb-Pomerene, it authorizes American firms to do business abroad jointly under certain circumstances. Thus, for example, two widget manufacturers might be able to sell their widgets to consumers in Bolivia and Bulgaria at jointly-determined prices—hardly a big event for your average American consumer.

The big exemptions and immunities—the ones that count—are the ones for labor and agriculture. They impact much of what the average American eats and drinks and uses to do things. And they do it every day. All day. These exemptions cost American consumers billions of dollars a year. Every year. As things turned out, there wasn't much interest in facing up to those exemptions and immunities. Too much of a political football, I suppose. The thinking—probably correct—ran something like this: No Democrat from an industrial state can support repeal of labor antitrust exemptions and no Republican from an agricultural state can support repeal of food and dairy antitrust exemptions; so you get a bipartisan standoff: "I'll let you keep your exemption, if you'll let me keep mine."

The Commission's recommendations do state that "immunities from the antitrust laws should be disfavored." The recommendations go on to urge narrow construction, periodic review, sunsetting and other positive reforms. Some of my fellow Commissioners bemoan the fact that the Commission did not take the next step and recommend the elimination of specific exemptions and immunities. Maybe we should have. After all, the arguments for specific exemptions and immunities, as others have noted, are all pretty much the same and not convincing. And any exemption or immunity that becomes an ex-exemption or an ex-immunity is perhaps a step in the right direction. Still, I think we would have looked silly—probably even cowardly—had we recommended the elimination of third-string exemptions and immunities that don't have much impact and ducked addressing those exemptions and immunities that have widespread reach and do serious harm to hundreds of millions of Americans every day. I don't see much glory or accomplishment from swatting an irritating gnat to death while ignoring an 800-pound gorilla that is wreaking havoc in the room. If we're serious about our opposition to exemptions and immunities from the antitrust laws, then let's approach it in a serious manner. Let's start with the mortal sins, not the venial sins. Let's start with those that cause major harm, not with those that are minor irritants.

Regulated industries. The antitrust analysis of regulated industries is a close cousin to the antitrust analysis of exemptions and immunities. In both cases, the workings of free markets are displaced. In the case of exemptions and immunities, they are replaced with sanctioned price-fixing; in the case of regulation, they are replaced with government regulation. For the most part, government regulation hasn't worked out very well. It leads to a host of problems—not the least of which is "regulatory capture." Over time, instead of the regulators protecting the public from those being regulated, the regulators end up protecting those being regulated from the public.

Over the past several decades these realities and the other inadequacies of regulation have become increasingly apparent and there has been a commendable movement toward deregulation. As the Commission recommendations state: "In recent decades, public policy in the United States has moved towards partial or full deregulation in industries formerly subject to economic regulation—that is, regulation of prices, costs, and entry. The trend toward deregulation has benefited consumers and the economy and should be furthered where practicable." I wholeheartedly concur with this view. The only reason I did not join in some of the specific recommendations that follow with respect to what Congress should or shouldn't do when they decide to go in the opposite direction is that those recommendations strike me as a bit presumptuous. Once Congress has decided that there are good and sufficient reasons for regulation of some sort, then I think that those reasons—and not antitrust considerations—should guide Congress as to what is the best course. I would likely disagree with the starting premise in almost all cases, but that is beside the point. Once Congress concludes that there are sound reasons to regulate, then it is those sound reasons that should drive what follows.

Does antitrust matter? I'd like to believe it does, and I do believe it does—at least when it comes to price-fixing and other naked restraints that clearly violate Section 1 of the

Sherman Act. To me at least, the economic theory is rock solid and the evidence with which I am familiar is wholly persuasive. But there is a lack of empirical studies to back up these beliefs. More importantly, some recent work by distinguished scholars calls the question into issue. (*See, for example*, R. Crandall & C. Winston, *Does Antitrust Policy Improve Consumer Welfare? Assessing the Evidence*, 17 J. of Econ. Perspective 2 (2003).)

In a thoughtful early written submission to the Commission, the then-sitting Assistant Attorney General for the Antitrust Division, R. Hewitt Pate, suggested that the Commission undertake to study this question in depth. As he put it:

> Some antitrust commentators contend that there is no empirical foundation for the conviction that antitrust enforcement benefits consumers and the economy. It seems plain to me that combating cartels and forestalling perceived needs for regulation have alone provided great benefits, but more empirical evaluation of the effects of antitrust enforcement would certainly be desirable. The Commission should consider engaging respected experts (including those who do not earn their living providing antitrust services) to design a rigorous study of the effects of antitrust enforcement. Data could be collected and evaluated, with case selection criteria and evaluation standards objectively designed in advance. Such a study might run for several years. Bolstering empirical evaluation of antitrust enforcement could be an important and lasting achievement of the Commission. (Letter to D. Garza from R. H. Pate, January 5, 2005; http://www.amc.gov/comments/pate.pdf).

Unfortunately, in my view, the Commission decided not to do follow this suggestion. At our hearings, several of those who testified endorsed Hew Pate's suggestion, including another former head of the Antitrust Division and a former Chairman of the Federal Trade Commission. As one outgrowth of such testimony and other considerations, our Commission did recommend that such studies be undertaken in the merger area (and that consideration be given to commissioning outsiders to do them). I certainly hope both that that will be done and that, over time, the undertaking will be expanded to include the kind of more fundamental study recommended by Mr. Pate.

Patents and antitrust. The first antitrust statute, the Sherman Act, was enacted in 1890. The patent laws predate that by more than a century. Indeed, the framers of the Constitution thought patent laws were so important that they expressly provided for them in the Article I, Section 8. Patent and antitrust are complementary in some respects, but there are also some tensions between them. After all, antitrust condemns monopolies and patents grant them. An effort to harmonize the two is all to the good, of course, and I join in the thrust of the Commissions recommendations in this regard.

I do have some concern, however, that some who labor in the antitrust vineyard give the antitrust laws a primacy over other fields that is not always warranted. This is understandable; those who spend all day, every day in a particular field can be expected to view the importance of that field as paramount. It is such concern that leads me not to join in the Commission's unqualified recommendation that Congress give consideration to the suggestions of the FTC with regard to possible changes in the patent laws. The FTC's report pays lip service to the importance of the patent laws, but some of its suggestions strike me as betraying a deeper hostility to the patent laws and a desire to have antitrust considerations improperly trump the patent laws. Let me give an example of to what I'm referring.

The FTC's first recommendation is that there be an administrative procedure at the PTO "for post-grant review and opposition that allows for meaningful challenges to patent validity short of federal court litigation." This sounds fine; after all, the PTO is where the "experts" reside. When there is some controversy as to the validity of a just-issued patent, let's let these experts take a fresh look, and let's do it in a proceeding that allows both sides of the story to be told—and tested on cross-examination. In its second recommendation, however, the FTC appears to do an about-face. It says that, should a patent then be attacked in court, the deference traditionally awarded to the validity of the patent because of the review by the experts at the PTO—now even involving a second review—should be thrown out the window. The FTC proposes that this be accomplished by replacing the "clear and convincing" evidentiary test for rebutting the presumption that a patent is valid with the "preponderance of the evidence" test. To me at least, some of the FTC's suggestions come across more as efforts to torpedo patents so that there will be more competition than efforts aimed a making the patent system work better so that only truly deserving patents are issued.

Direct/Indirect purchaser claims. I've always thought that the strange twin rulings in *Hanover Shoe* and *Illinois Brick* are explainable mainly by the order in which they arrived at the Supreme Court. Had *Illinois Brick* been the first case, I can't imagine that the Court would have held that persons clearly injured by an antitrust violation could not recover. Quite the contrary, I think that argument would have been rejected out of hand. And for good reason. Then, when *Hanover Shoe* came along next, the Court likely would have said that defendants can, of course, assert a "pass-on" defense to ensure that those who weren't damaged don't get windfall recoveries.

But it didn't happen that way. Instead, *Hanover Shoe* was the first of the two cases to come before the Court. The rest, as they say, is history. Fearful that antitrust violators would escape without consequence were a "pass-on" defense countenanced, the Court said defendants could not assert such a defense. Then, when *Illinois Brick* reached the Court, it stated, in a burst of deference to symmetry, that indirect purchasers could not sue. So there we were: people who weren't injured (because they had passed on the overcharges to their customers—sometimes with a mark-up that meant they actually made a profit on their supplier's price-fixing) could not only get windfall recoveries, but huge windfall recoveries—three times the damages they didn't suffer. To make matters worse, their customers, who were the ultimate target of the price-fixing activities to start with, couldn't recover bubkes.

Various States looked at this and—understandably—said "Hey, this makes no sense." So they passed state laws that said, in effect, of course indirect purchasers can sue and recover for price-fixing that causes them (as it was intended to do) actual injury and damages. What has followed has been a nightmare—both substantively and procedurally. We have the spectacle of massive recoveries by people who didn't suffer the loss of a dime (and in some cases actually made money) and the denial of recovery (at least at the federal level and many States) to many of those who suffered substantial damages. The situation cries out for corrective action.

The Commission thoughtfully considered a wide range of possible recommendations, including federal preemption, an overturning of only *Illinois Brick* and others. In the end, the Commission decided—wisely, in my view—to make a recommendation that would serve to conform antitrust to the way things generally work in other areas. Specifically, we fashioned a recommendation whose aim, as it expressly states, is to prevent "duplicative recoveries, denial of recoveries to persons who suffered injury or windfall recoveries to persons who did not suffer injury"—all three of which can occur under the present regime. I believe we succeeded, and I hope Congress will implement our recommendation.

One last observation on this subject. The Commission's final recommendations with regard to the subject of direct and indirect purchaser claims were not settled upon until our February 22, 2007 meeting, and our ultimate recommendation differed from the draft pending as we began that meeting. The drafting of that section of the report, however, had been substantially completed before the February meeting. While there was tinkering after the meeting to get that section of the report to conform to the final recommendation, I fear that the report may not capture adequately the spirit of the final recommendation. These recommendations were not about procedural convenience and ease of administration. While they may contain some useful suggestions on that front, the recommendations were driven primarily by the desire to achieve fairness and a just result.

Some thoughts about the Commission and its work. I suspect that all of the Commissioners have reflected on their experiences serving on the Antitrust Modernization Commission—certainly I have. Let me close with some observations on that subject.

The AMC leadership and staff. The Commissioners were fortunate to have Deb Garza and Jon Yarowsky at the helm as our Chair and Vice-Chair, respectively. Together, they provided a steady hand on the rudder and quiet, but effective, leadership. All of the Commissioners are indebted to them for all they did for the rest of us. In addition, the work of the Commissioners, both individually and collectively, was made easier by the assistance of an able staff—from our Executive Director and Senior Counsel to our clerical personnel. Not only did they do an outstanding job, but they did it under tight deadlines, often having to integrate a great deal of input (sometimes conflicting) from various Commissioners. Throughout, they did their jobs with a positive and cheerful disposition.

The "inside baseball" perspective. Looking back, there are some things that might have been done differently. One is the composition of the Commission. Many of the Commissioners are "experts" in the antitrust field and have spent most of their professional careers laboring in the antitrust field. That proved valuable in many ways. Still, the Commission might have benefited had its membership included more individuals who were not part of the antitrust "inside baseball" establishment. Among other things, such individuals generally have a balanced perspective of all relevant considerations and do not elevate antitrust to an unwarranted primacy as a consideration that should be taken into account more than other important considerations.

The same can be said of the witnesses who appeared before us. They too came from the antitrust establishment for the most part. No one was excluded, of course, and the Commission extended a broad invitation for testimony and written submissions that was published in the *Federal Register*. But not a lot of people sit around reading the *Federal Register* to see what they want to do next week. Fortunately, some individuals from the business world or otherwise outside the antitrust arena did provide the Commission with their views by way of valuable testimony or written submissions. Some others were also invited, but declined to participate—perhaps not wanting to raise their antitrust profile. Whatever the circumstance, however, in retrospect, the Commission should have done more to get the views of "real" people from the commercial world who have to live out their business lives under the rules of the antitrust laws day-in and day-out.

The recommendations and the report. The fingerprints of the Commissioners—all twelve of them—are all over each and every one of the recommendations made to the President and Congress. That is not true as to the report that accompanies the recommendations. In short, the recommendations are decidedly the work product of the Commissioners, while the report is primarily the work product of the staff. Each Commissioner had an opportunity to read and comment on the report, of course, but the Commissioners did not do the same kind of intense scrutiny, study and discussion and debate that was done in the case of the recommendations. I say this not so much as a criticism of the report but rather so that those who review the work of the Commission will understand that the Commissioners' individual, collective and collaborative efforts were directed to the recommendations far more than to the report.

Miscellaneous. There are many issues the Commission didn't address. We had to pick and choose among many possible topics and attempt to use our limited time most effectively. Looking back, there are some things we didn't address that I wish we had. Specifically, for example, I wish we had taken a closer look at whether it makes sense to have two antitrust enforcement agencies whose responsibilities often overlap. The FTC seems to have gotten away from what was envisioned as one of its primary ongoing activities at the time of its creation, scholarly studies of matters of importance to sound antitrust policy. Perhaps if its enforcement responsibilities were limited to areas that did not overlap with those of the DOJ, its efforts could be more productively redirected to an area it has largely abandoned. We should also have examined Section 5 of the FTC Act and whether it plays a positive or negative role in the ongoing effort to achieve sound antitrust enforcement. Finally, the Commission's examination of the topics on which we chose to focus was done within the construct of the existing antitrust framework. Some suggested that we take a more bottoms-up approach, starting with a blank sheet of paper and trying to fashion a "better" framework from scratch. Some of the submissions we received in this regard were quite exciting; I wish we had had the time to give the consideration to them that they warranted.

Addendum: A Tale of Two Guys

It was the best of times; it was the worst of times. The best of times for John Doe, and the worst of times for James Doe. Here's how it all happened.

John and Jim Doe were brothers, twin brothers, in fact—the only two children of Frank and Mary Doe. They were born and raised on the Doe family farm, just outside of Smallville, Iowa.

Frank Doe ran a very successful dairy farm. In the early 1950s, he decided to expand by opening a dairy-farm equipment dealership in Smallville. With the post-war boom in farm mechanization, it too was a big success. When John and Jim returned home from their stint in the Army during the Korean War, they went into the family businesses with their dad, John running the dairy farm and Jim running the dairy-farm equipment dealership. And when Frank died in the mid-1970s, he left the farm to John and the dealership to Jim.

John and Jim Doe became successful businessmen. Over time, they also became industry leaders. John eventually became head of the local dairy-farm coop, and Jim the head of the local association of dairy-farm implement dealers. One of the things that both John and Jim did as heads of their respective organizations, was lead the effort to establish fair prices for their respective industries to charge customers. They were good at this too.

When people realized what an outstanding job John had done in setting prices for dairy-farm products, he was named Farmer-of-the-Year, there was picture of him on the cover of *Iowa Gazette* and he went to a big dinner honoring him in a black tux. When people realized what an outstanding job Jim had done in setting prices for dairy-farm implements, however, he was named Felon-of-the-Year, there was a picture of him on the cover of *Police Gazette* and he went to a big jail in an orange prison suit.

Fixing prices, you see, is legal for certain dairy farm products but illegal for dairy-farm implements. Dairy farm coops persuaded Congress to pass laws making it okay for them to fix prices—one of the many so-called "exemptions and immunities" from the antitrust laws. Those selling dairy-farm implements, however, failed in their efforts to secure such legislation making it okay for them to fix prices.

And so our story ends. John Doe is a hero, and Jim Doe is a villain. And yet they both did exactly the same thing.

Separate Statement of Commissioner Shenefield

I write separately to address the Commission's views on antitrust exemptions and immunities, and also on the Robinson-Patman Act.

Exemptions and Immunities

The central organizing principle of the U.S. economy is competition, which will spur productivity and enhance innovation. Notwithstanding the prominence of the free market model, the economy nevertheless tolerates some notable exceptions to the rule of competitive markets. Frequently, those exceptions are marked by statutory exemptions and immunities from the full application of the antitrust laws. The Commission's report ably describes the background and explains the continued persistence of these occasional deviations from the competitive principle.

The Commission's broad mandate and compressed schedule made it impossible to investigate any of the specific exemptions and immunities sufficiently to allow the Commission to feel comfortable in recommending the repeal of any of them, including some of the most ill-considered and egregious examples. Although understandable, that shortcoming in the Commission's work was an opportunity missed. Empirical data on sectoral deregulation suggest the magnitude of the missed opportunity, and counsel the way forward. I believe the President and Congress should create another commission of experts to undertake a broad-ranging evaluation of the antitrust exemptions and immunities now on the books. Although the repeal of some of the most unfortunate, including particularly the McCarran-Ferguson Act, the Shipping Act exemption and the Export Trading Company Act and Webb-Pomerene exemptions should not be delayed, the creation of such a commission would set the stage for a thorough and long-overdue policy review of all exemptions and immunities, thus going a long way to complete the deregulation work so well begun in the administrations of Presidents Ford and Carter.

Robinson-Patman Act

Notwithstanding its reticence with respect to the repeal of specific exemptions and immunities, the Commission recommends total repeal of the Robinson-Patman Act. Moreover it does so on a record composed more of academic opinion than of solid evidence. There is no serious disagreement that enforcement of the Act has on occasion had unnecessarily anticompetitive effects. The question for judgment is whether there is a rationale for conserving a kernel of the Act, amended to address the most serious criticisms. The Commission believes there is not, and accordingly recommends total repeal. I am unpersuaded by the record before the Commission, and thus do not support the Commission's recommendation.

Instead, I believe reform is in order. Any such reform should import into the Robinson-Patman Act two fundamental concepts that would preserve the benefit of maintaining a law prohibiting anticompetitive discrimination but avoid the unnecessary disadvantages of the Act in its current form. First, I favor amending or reinterpreting the statute to make it clear that plaintiffs in secondary line cases under section 2(a) of the Act must prove competitive injury through the existence either of market power or buyer power (which would also affect liability under section 2(f) as well). I would also amend the statute to introduce a parallel competitive injury requirement into sections 2(d) and 2(e). Second, I would relax the cost justification standard by permitting a preferential price that was "reasonably related" to cost savings attributable to dealing with the favored buyer.

I join the Commission in recommending repeal of section 3 of the Act (the criminal provision). I would also repeal section 2(c).

My recommendation has the advantage over that proposed by the Commission of being politically feasible. I opt for sensible and incremental reform that has at least a chance of making important progress.

Separate Statement of Commissioner Warden

My views depart from those of a majority of Commissioners as to three significant issues: (1) the role of state law; (2) state "enforcement" of federal law; and (3) the rules as to costs and damages in private actions.*

The Role of State Law

I believe that state law—whether called antitrust law, consumer protection law or unfair competition law—that regulates the same business activity with the same purported objectives as the federal antitrust laws should be preempted except in its application to strictly local activities affecting a particular State.

While the Commission has found no compelling factual case for preemption, the potential for the development of inconsistent standards to serve parochial, idiosyncratic or even private interests is clearly present. Business today is increasingly global in scope, and firms are subject to the laws of the United States, the European Union and an increasing number of developed and developing nations and to scrutiny by the enforcement authorities of all those jurisdictions. The exercise of legislative and enforcement jurisdiction by 50 plus additional entities within the United States is a burden on interstate and foreign commerce in terms of merger review and monopolization cases and provides little, if any, countervailing benefit.

Legitimate interests of the States and their citizens regarding multistate and multinational conduct are fully protected by their respective ability, appropriately circumscribed by standing and antitrust injury requirements, to assert claims under the federal antitrust laws. I am not persuaded by arguments for preserving state law based on historical legal developments during the 19th century. Our notions of the federal commerce power, of the States' ability to exercise their police powers against claims of freedom of contract and of many other matters are far different today, as, of course, is the nature and scope of economic activity. And, as our Report notes, even in 1890, when urging the adoption of what became the Sherman Act, Senator Sherman stated: "Each state can deal with a combination within the State, but only the General Government can deal with combinations reaching to not only the several States, but the commercial world."

Nor am I persuaded by a supposed need for the States to act when federal enforcement is "lax" in the eye of some beholder. The development and enforcement of a coherent, effective and balanced national competition policy by the federal enforcement authorities includes

* Commissioner Garza joins this statement with respect to the role of state law and state "enforcement" of federal law.

decisions on what not to pursue as fully as it does decisions on what to pursue. A national competition policy must be just that—national. As discussed in the next section, both the Supreme Court and Congress have at least implicitly recognized this obvious reality.

State "Enforcement" of Federal Law

I have no quarrel with Congress's decision to grant the States standing to sue under the federal antitrust laws in their capacity as *parens patriae* to recover damages for injured consumers in their respective jurisdictions. As our Report notes, such actions may be preferable in terms of cost and efficiency to consumer class actions. Likewise, the States' right to sue for damages in their proprietary capacity raises no issue.

Nor do I question the Supreme Court's long line of decisions allowing the States suing *parens patriae* to seek equitable relief for state-specific injury in federal courts pursuant to Section 16 of the Clayton Act, which governs actions by all private parties. As is further discussed below, the Supreme Court has not, however, conferred on the States general "law enforcement" authority under the federal antitrust laws. Rather, its decisions, which do not distinguish between state actions under Section 16 and other state *parens patriae* actions, clearly require a State to allege and prove injury particularized to its economy and not common to all or a large part of the nation. *See, e.g., Pennsylvania v. West Virginia*, 262 U.S. 553, 591 (1923); *Georgia v. Pennsylvania R.R.*, 324 U.S. 439, 443, 447–49 (1945); *Hawaii v. Standard Oil Co.*, 405 U.S. 251, 270–71 (1972); *see generally Alfred L. Snapp & Son, Inc. v. Puerto Rico*, 458 U.S. 592, 602–07 (1982).

Permitting the States to seek equitable relief on the same footing as the federal enforcement authorities would pose the same problems as permitting state law to govern national and global activities, as Congress has recognized. When the Clayton Act was enacted in 1914, the Senate rejected an amendment that would have given the States power to enforce the antitrust laws in the name of the United States. 51 Cong. Rec. S14, 526 (daily ed. Sept. 1, 1914).[1] Among the reasons advanced for rejection were "the great danger of having a diversity of conclusions" (Senator Gallinger, 51 Cong. Rec. S14,477, daily ed. Aug. 31, 1914); the prevention of "the carrying out of any uniform policy in the enforcement of the antitrust law" (Senator Colt, 51 Cong. Rec. S14,518, daily ed. Sept. 1, 1914); and the fear that state attorneys general would "desert their own duties for another field that, for one reason or another, they might find to be more attractive" (Senator Pomerene, *id.*, at 14,519.)[2]

The Clayton Act as enacted makes no provision for actions in equity specifically by the States. Given the Supreme Court's earlier rejection of state standing to enforce the Sherman

---

[1] The portions of the Congressional Record here cited are reprinted in 3 Kintner, The Legislative History of the Federal Antitrust Laws and Related Statutes (1978).

[2] Recent experience has shown Senator Pomerene to have been more prescient than Nostradamus and with no inkling of the magnetism of television cameras.

Act, *Minnesota v. Northern Securities Co.*, 194 U.S. 48, 70–71 (1904) (those "acting under the direction of the Attorney General" are to enforce the Sherman Act, "according to some uniform plan, operative throughout the entire country"); *Louisiana v. Texas*, 176 U.S. 1, 19 (1900) ("the vindication of the freedom of interstate commerce is not committed to the State of Louisiana"), and the Senate's affirmation of that rejection, any claim of state standing to "enforce" the antitrust laws broader than that enjoyed by any private party or that conferred by the Supreme Court's general *parens patriae* decisions discussed above, is not sustainable.

Because I am convinced that the Supreme Court will reject a claim by one or more States that they may sue as *parens patriae* in equity under the federal antitrust laws for other than state-specific injury if such a claim is squarely presented to it, I see no need for legislative action in this respect. I emphasize the point in this statement because the Commission's Report assumes the States are "enforcement authorities" and because it has a clear impact on the nature of the relief to which a State might conceivably be entitled as a private party suing under Section 16—in contrast to the scope of relief available to the federal enforcement authorities—in any future action that like, for example, *Microsoft*, involves conduct global or national in scope.

Predominantly local matters have in fact been the principal focus of state enforcement, and the States have played a useful and effective role in protecting competition through such enforcement. Their Section 16 actions, as their legislation, should be directed solely to such local matters in the global economy of the 21st century.

Private Damage Actions

Government injunctive actions, with limited exceptions, seek prospective relief barring conduct claimed to be illegal.[3] These actions have served to develop the law and, in my judgment, have thereby saved the Sherman Act from constitutional vagueness challenges. *See generally United States v. United States Gypsum Co.*, 438 U.S. 422, 440–42 (1978); *compare United States v. Cohen Grocery Co.*, 255 U.S. 81 (1921). At the other end of the enforcement spectrum lie criminal prosecutions, which the Department of Justice has, properly, brought only in cases involving "hard core" cartel activity and which, of course, require proof beyond a reasonable doubt. Without endorsing every enforcement decision or the result reached in every case, I join the vast majority of observers in concluding that both of these enforcement mechanisms are working well.

The same cannot be said, in my judgment, of private treble damage actions. Such actions are brought not by enforcement agencies exercising discretion and concerned not to do more harm than good, but by private parties seeking only their own self-interest. The "enforce-

[3] The limited exceptions are cases seeking dissolution or divestiture or what might be termed regulatory relief. Dissolution and divestiture cases have been rare since *AT&T*; the obvious recent example of regulatory relief is *Microsoft*.

ment" aspect of these actions—lauded by many—is purely incidental to their self-seeking motivation. Moreover, the statutory provision for trebling of damages renders relief in these cases punitive, as has been universally recognized. *See, e.g., Cantor v. Detroit Edison Co.*, 428 U.S. 579, 599 (1976); *Hartford-Empire Co. v. United States*, 323 U.S. 386, 409 (1945). When that provision is joined with joint and several liability, as it now is, the punitive sanction visited upon a defendant that goes to trial and loses can be truly draconian—indeed, far greater than the maximum criminal fine. *See generally*, II AREEDA & HOVENKAMP, ANTITRUST LAW ¶ 303 (2d ed. 2000); II AREEDA & TURNER, ANTITRUST LAW 32–36 (1978).

The Commission's recommendations for legislation providing for claim reduction and contribution are a solid start toward redressing the Kafkaesque dilemma of a defendant confronted with charges it believes unfounded and wishes to contest. Those who oppose this, and indeed any alleviation of the dilemma, invoke a single mantra—"cartel." To favor cartels is, of course, in a league with opposing motherhood and apple pie. But the issue is hardly so simple and, I hasten to add, neither the problem nor its resolution has anything to do with cartel cases. Indeed, criminal prosecutions are better suited to deterring and punishing cartel behavior than are private civil actions, whose purpose should be to compensate, not to sanction.

The Supreme Court has recognized the dangers of chilling competitive behavior by the threat of punishment in the context of criminal prosecutions, *Gypsum*, *supra*, and Professor Areeda has observed the obvious fact that the same dangers are presented by treble-damage penalties, AREEDA & HOVENKAMP, *supra*; AREEDA & TURNER, *supra*. But while "over deterrence" is clearly at stake, so are other interests, including fundamental fairness in the judicial process.

First, fundamental fairness requires that before the punitive sanction of trebling is invoked, there be proof by clear and convincing evidence of clearly unlawful conduct.[4] This should pose no problem for those seeking to recover overcharges from cartels, and it at least reduces the likelihood of punishing the innocent through what the academics call "false positives" and I call miscarriages of justice. Single damages seem entirely fair to an antitrust tort plaintiff who can prove its case only by a preponderance of the evidence and cannot demonstrate that the conduct so proven was clearly unlawful, the latter determination to be made taking into consideration both prior legal precedent and whether the conduct was overt and unchallenged for some years.

Second, actions brought by competitors have the potential for themselves being anticompetitive. It is sad, but true, that some firms take the view—to paraphrase General von Clausewitz—that litigation is an extension of business rivalry by means other than competition. All types of antitrust actions can impose on the parties huge costs (often running into

---

[4] Professor Areeda appears to have endorsed such an approach in the 1978 edition of ANTITRUST LAW, and that endorsement has been continued by his successors in the 2000 edition.

eight figures) from discovery and motion practice, even if ultimately resolved on summary judgment. A prevailing plaintiff, in addition to damages, recovers its attorneys' fees, while a prevailing defendant recovers nothing but narrowly defined "costs." This imbalance probably cannot practicably be redressed in consumer class actions, but it can be in competitor cases where the plaintiff is a substantial firm. Accordingly, I urge that Congress provide for the award of attorneys' fees to prevailing defendants in such cases absent a determination by the court that an award would be manifestly unjust in a particular case. This would not only provide a measure of fairness to the defendant but would discourage rivals from bringing cases that are merely tactical, and would thereby serve the public goal of fostering competition on the merits.

Third, I would award full prejudgment interest to a prevailing plaintiff in any case where treble damages are not awarded. Where damages are trebled, I would make no change in existing law as to the award of interest, since prejudgment interest is not necessary to secure full compensation.

Final Comments

I offer additional comments on three other topics: patents, regulated industries and civil process.

Patents. The Constitution allows patents to be issued only for "inventions." *See* Article I, § 8. That requirement—termed "nonobviousness" in the implementing statute, 35 U.S.C. § 103—"may not be ignored." *Graham v. John Deere Co.*, 383 U.S.1, 6, 13–17 (1966). Despite the Supreme Court's repeated admonitions, both the PTO and the Federal Circuit appear consistently to have ignored the constitutional mandate. It is simply not possible to believe that true "inventions" have reached the level of 174,000 a year, but that is the number of patents the PTO issued in fiscal 2006.

Patents on the obvious impede not only competition but commerce itself by subjecting investment to uncertainty and the expense of litigation. I have little direct experience in this area, but that little has convinced me that a radical rethinking of doctrine is required. The review of "prior art" may be too narrowly confined by looking only to the art of a very specific field. The fact that two—or three or four or more—putative inventors unaware of each other's work dispute which of them was first by a margin of weeks or months to complete an "invention" may itself be evidence of obviousness; it may be that the "invention" was simply the inevitable next step in the evolution of technology by those skilled in the art. The statutory presumption of validity and reinforcing subsidiary presumptions devised by the Federal Circuit may be unwarranted by reality.

I can carry this inquiry no further, but I think Congress should and should do so with the assistance of talented generalists in business, law and science, not just patent specialists. In urging this undertaking, I am not seeking to accord antitrust primacy over patents. There is no conflict between antitrust law and patent law, but there is a conflict between the present administration of the patent laws and the Constitution—a conflict that would exist were there no antitrust laws.

Regulated Industries. While I subscribe in large measure to the section of our Report dealing with regulated industries, in my judgment its usefulness is limited by a failure to distinguish sufficiently between businesses traditionally treated as utilities and now partially or wholly "deregulated" and businesses, particularly those providing financial services, that were never viewed as utilities but have long been subject to economic regulation and are likely to remain so.

Civil Process. The Commission did not study process in civil antitrust litigation, but I would be remiss were I not to include in this statement an exhortation to the courts on that subject. I have made my entire career in the field of commercial litigation, but, as a citizen, it seems incontrovertible to me that such litigation is a social overhead cost that should be minimized to the fullest extent consistent with the objectives of law enforcement, dispute resolution and tort compensation.

Today, the process costs of antitrust cases, like other major commercial cases in the United States, can become truly outlandish. From my 40 years of experience, I am convinced beyond peradventure that this level of cost is orders of magnitude beyond that necessary to fair and reasoned adjudication. The only effective solution lies with the courts themselves; judges must begin to apply cost/benefit analysis to process, rather than the "no stone unturned" approach that often seems to be the order of the day despite the provisions of Rule 26(b)(2). The cost of justice should not, itself, be unjust.

Antitrust Modernization Commission Act of 2002, as amended

Pub. L. No. 107-273, 116 Stat. 1856 (2002), as amended by the Antitrust Modernization Commission Extension Act of 2007, Pub. L. No. 110-6, 121 Stat. 61 (2007)

Sec. 11051. Short Title.

This subtitle may be cited as the "Antitrust Modernization Commission Act of 2002."

Sec. 11052. Establishment.

There is established the Antitrust Modernization Commission (in this subtitle referred to as the "Commission").

Sec. 11053. Duties of the Commission.

The duties of the Commission are—

(1) to examine whether the need exists to modernize the antitrust laws and to identify and study related issues;

(2) to solicit views of all parties concerned with the operation of the antitrust laws;

(3) to evaluate the advisability of proposals and current arrangements with respect to any issues so identified; and

(4) to prepare and to submit to Congress and the President a report in accordance with section 11058.

Sec. 11054. Membership.

(a) Number and Appointment.—The Commission shall be composed of 12 members appointed as follows:

(1) Four members, no more than 2 of whom shall be of the same political party, shall be appointed by the President. The President shall appoint members of the opposing party only on the recommendation of the leaders of Congress from that party.

(2) Two members shall be appointed by the majority leader of the Senate.

(3) Two members shall be appointed by the minority leader of the Senate.

(4) Two members shall be appointed by the Speaker of the House of Representatives.

(5) Two members shall be appointed by the minority leader of the House of Representatives.

(b) Ineligibility for Appointment.—Members of Congress shall be ineligible for appointment to the Commission.

(c) Term of Appointment.—

(1) In general.—Subject to paragraph (2), members of the Commission shall be appointed for the life of the Commission.

(2) Early termination of appointment.—If a member of the Commission who is appointed to the Commission as—

(A) an officer or employee of a government ceases to be an officer or employee of such government; or

(B) an individual who is not an officer or employee of a government becomes an officer or employee of a government;

then such member shall cease to be a member of the Commission on the expiration of the 90-day period beginning on the date such member ceases to be such officer or employee of such government, or becomes an officer or employee of a government, as the case may be.

(d) Quorum.—Seven members of the Commission shall constitute a quorum, but a lesser number may conduct meetings.

(e) Appointment Deadline.—Initial appointments under subsection (a) shall be made not later than 60 days after the date of enactment of this Act [Nov. 2, 2002].

(f) Meetings.—The Commission shall meet at the call of the chairperson. The first meeting of the Commission shall be held not later than 30 days after the date on which all members of the Commission are first appointed under subsection (a) or funds are appropriated to carry out this subtitle, whichever occurs later.

(g) Vacancy.—A vacancy on the Commission shall be filled in the same manner as the initial appointment is made.

(h) Consultation Before Appointment.—Before appointing members of the Commission, the President, the majority and minority leaders of the Senate, the Speaker of the House of Representatives, and the minority leader of the House of Representatives shall consult with each other to ensure fair and equitable representation of various points of view in the Commission.

(i) Chairperson; Vice Chairperson.—The President shall select the chairperson of the Commission from among its appointed members. The leaders of Congress from the opposing party of the President shall select the vice chairperson of the Commission from among its remaining members.

Sec. 11055. Compensation of the Commission.

(a) Pay.—

(1) Nongovernment employees.—Each member of the Commission who is not otherwise employed by a government shall be entitled to receive the daily equivalent of the annual rate of basic pay payable for level IV of the Executive Schedule under section 5315 of title 5 United States Code, as in effect from time to time, for each day (including travel time) during which such member is engaged in the actual performance of duties of the Commission.

(2) Government employees.—A member of the Commission who is an officer or employee of a government shall serve without additional pay (or benefits in the nature of compensation) for service as a member of the Commission.

(b) Travel Expenses.—Members of the Commission shall receive travel expenses, including per diem in lieu of subsistence, in accordance with subchapter I of chapter 57 of title 5, United States Code.

Sec. 11056. Staff of Commission; Experts and Consultants.

(a) Staff.—

(1) Appointment.—The chairperson of the Commission may, without regard to the provisions of chapter 51 of title 5 of the United States Code (relating to appointments in the competitive service), appoint and terminate an executive director and such other staff as are necessary to enable the Commission to perform its duties. The appointment of an executive director shall be subject to approval by the Commission.

(2) Compensation.—The chairperson of the Commission may fix the compensation of the executive director and other staff without regard to the provisions of chapter 51 and subchapter III of chapter 53 of title 5 of the United States Code (relating to classification of positions and General Schedule pay rates), except that the rate of pay for the executive director and other staff may not exceed the rate of basic pay payable for level V of the Executive Schedule under section 5315 of title 5 United States Code, as in effect from time to time.

(b) Experts and Consultants.—The Commission may procure temporary and intermittent services of experts and consultants in accordance with section 3109 (b) of title 5, United States Code.

Sec. 11057. Powers of the Commission.

(a) Hearings and Meetings.—The Commission, or a member of the Commission if authorized by the Commission, may hold such hearings, sit and act at such time and places, take such testimony, and receive such evidence, as the Commission considers to be appropriate. The Commission or a member of the Commission may administer oaths or affirmations to witnesses appearing before the Commission or such member.

(b) Official Data.—The Commission may obtain directly from any executive agency (as defined in section 105 of title 5 of the United States Code) or court information necessary to enable it to carry out its duties under this subtitle. On the request of the chairperson of the Commission, and consistent with any other law, the head of an executive agency or of a Federal court shall provide such information to the Commission.

(c) Facilities and Support Services.—The Administrator of General Services shall provide to the Commission on a reimbursable basis such facilities and support services as the Commission may request. On request of the Commission, the head of an executive agency may make any of the facilities or services of such agency available to the Commission, on a reimbursable or nonreimbursable basis, to assist the Commission in carrying out its duties under this subtitle.

(d) Expenditures and Contracts.—The Commission or, on authorization of the Commission, a member of the Commission may make expenditures and enter into contracts for the procurement of such supplies, services, and property as the Commission or such member considers to be appropriate for the purpose of carrying out the duties of the Commission. Such expenditures and contracts may be made only to such extent or in such amounts as are provided in advance in appropriation Acts.

(e) Mails.—The Commission may use the United States mails in the same manner and under the same conditions as other departments and agencies of the United States.

(f) Gifts, Bequests, and Devises.—The Commission may accept, use, and dispose of gifts, bequests, or devises of services or property, both real and personal, for the purpose of aiding or facilitating the work of the Commission. Gifts, bequests, or devises of money and proceeds from sales of other property received as gifts, bequests, or devises shall be deposited in the Treasury and shall be available for disbursement upon order of the Commission.

Sec. 11058. Report.

Not later than 3 years after the first meeting of the Commission, the Commission shall submit to Congress and the President a report containing a detailed statement of the findings and conclusions of the Commission, together with recommendations for legislative or administrative action the Commission considers to be appropriate.

Sec. 11059. Termination of the Commission.

The Commission shall cease to exist 60 days after the date on which the report required by section 11058 is submitted.

Sec. 11060. Authorization of the Commission.

There is authorized to be appropriated $4,000,000 to carry out this subtitle.

Sherman Act

15 U.S.C. § 1 (Section 1 of the Sherman Act)

Every contract, combination in the form of trust or otherwise, or conspiracy, in restraint of trade or commerce among the several States, or with foreign nations, is declared to be illegal. Every person who shall make any contract or engage in any combination or conspiracy hereby declared to be illegal shall be deemed guilty of a felony, and, on conviction thereof, shall be punished by fine not exceeding $100,000,000 if a corporation, or, if any other person, $1,000,000, or by imprisonment not exceeding 10 years, or by both said punishments, in the discretion of the court.

15 U.S.C. § 2 (Section 2 of the Sherman Act)

Every person who shall monopolize, or attempt to monopolize, or combine or conspire with any other person or persons, to monopolize any part of the trade or commerce among the several States, or with foreign nations, shall be deemed guilty of a felony, and, on conviction thereof, shall be punished by fine not exceeding $100,000,000 if a corporation, or, if any other person, $1,000,000, or by imprisonment not exceeding 10 years, or by both said punishments, in the discretion of the court.

Clayton Act

15 U.S.C. § 12 (Section 1 of the Clayton Act)

(a) "Antitrust laws," as used herein, includes the Act entitled "An Act to protect trade and commerce against unlawful restraints and monopolies," approved July second, eighteen hundred and ninety; sections seventy-three to seventy-seven, inclusive, of an Act entitled "An Act to reduce taxation, to provide revenue for the Government, and for other purposes," of August twenty-seventh, eighteen hundred and ninety-four; an Act entitled "An Act to amend sections seventy-three and seventy-six of the Act of August twenty-seventh, eighteen hundred and ninety-four, entitled 'An Act to reduce taxation, to provide revenue for the Government, and for other purposes,'" approved February twelfth, nineteen hundred and thirteen; and also this Act.

"Commerce," as used herein, means trade or commerce among the several States and with foreign nations, or between the District of Columbia or any Territory of the United States and any State, Territory, or foreign nation, or between any insular possessions or other places under the jurisdiction of the United States, or between any such possession or place and any State or Territory of the United States or the District of Columbia or any foreign nation, or within the District of Columbia or any Territory or any insular possession or other place under the jurisdiction of the United States: Provided, That nothing in this Act contained shall apply to the Philippine Islands.

The word "person" or "persons" wherever used in this Act shall be deemed to include corporations and associations existing under or authorized by the laws of either the United States, the laws of any of the Territories, the laws of any State, or the laws of any foreign country.

(b) This Act may be cited as the "Clayton Act."

15 U.S.C. § 13 (Section 2 of the Clayton Act)

[See Robinson-Patman Act, below]

15 U.S.C. § 15 (Section 4 of the Clayton Act)

(a) Except as provided in subsection (b) of this section, any person who shall be injured in his business or property by reason of anything forbidden in the antitrust laws may sue therefor in any district court of the United States in the district in which the defendant resides or is found or has an agent, without respect to the amount in controversy, and shall recover threefold the damages by him sustained, and the cost of suit, including a reasonable attorney's fee. The court may award under this section, pursuant to a motion by such person promptly made, simple interest on actual damages for the period beginning on the date of service of such person's pleading setting forth a claim under the antitrust laws and ending on the date of judgment, or for any shorter period therein, if the court finds that the award of such interest for such period is just in the circumstances. In determining whether an award of interest under this section for any period is just in the circumstances, the court shall consider only—

(1) whether such person or the opposing party, or either party's representative, made motions or asserted claims or defenses so lacking in merit as to show that such party or representative acted intentionally for delay, or otherwise acted in bad faith;

(2) whether, in the course of the action involved, such person or the opposing party, or either party's representative, violated any applicable rule, statute, or court order providing for sanctions for dilatory behavior or otherwise providing for expeditious proceedings; and

(3) whether such person or the opposing party, or either party's representative, engaged in conduct primarily for the purpose of delaying the litigation or increasing the cost thereof.

(b)

(1) Except as provided in paragraph (2), any person who is a foreign state may not recover under subsection (a) of this section an amount in excess of the actual damages sustained by it and the cost of suit, including a reasonable attorney's fee.

(2) Paragraph (1) shall not apply to a foreign state if—

(A) such foreign state would be denied, under section 1605(a)(2) of Title 28, immunity in a case in which the action is based upon a commercial activity, or an act, that is the subject matter of its claim under this section;

(B) such foreign state waives all defenses based upon or arising out of its status as a foreign state, to any claims brought against it in the same action;

(C) such foreign state engages primarily in commercial activities; and

(D) such foreign state does not function, with respect to the commercial activity, or the act, that is the subject matter of its claim under this section as a procurement entity for itself or for another foreign state.

(c) For purposes of this section—

(1) the term "commercial activity" shall have the meaning given it in section 1603(d) of Title 28, and

(2) the term "foreign state" shall have the meaning given it in section 1603(a) of Title 28.

15 U.S.C. § 15a (Section 4A of the Clayton Act)

Whenever the United States is hereafter injured in its business or property by reason of anything forbidden in the antitrust laws it may sue therefor in the United States district court for the district in which the defendant resides or is found or has an agent, without respect to the amount in controversy, and shall recover threefold the damages by it sustained and the cost of suit. The court may award under this section, pursuant to a motion by the United States promptly made, simple interest on actual damages for the period beginning on the date of service of the pleading of the United States setting forth a claim under the antitrust laws and ending on the date of judgment, or for any shorter period therein, if the court finds that the award of such interest for such period is just in the circumstances. In determining whether an award of interest under this section for any period is just in the circumstances, the court shall consider only—

(1) whether the United States or the opposing party, or either party's representative, made motions or asserted claims or defenses so lacking in merit as to show that such party or representative acted intentionally for delay or otherwise acted in bad faith;

(2) whether, in the course of the action involved, the United States or the opposing party, or either party's representative, violated any applicable rule, statute, or court order providing for sanctions for dilatory behavior or otherwise providing for expeditious proceedings;

(3) whether the United States or the opposing party, or either party's representative, engaged in conduct primarily for the purpose of delaying the litigation or increasing the cost thereof; and

(4) whether the award of such interest is necessary to compensate the United States adequately for the injury sustained by the United States.

15 U.S.C. § 15b (Section 4B of the Clayton Act)

Any action to enforce any cause of action under sections [4, 4A, or 4C] of this [Act] shall be forever barred unless commenced within four years after the cause of action accrued. No cause of action barred under existing law on the effective date of this Act shall be revived by this Act.

15 U.S.C. § 15c (Section 4C of the Clayton Act)

(a) (1) Any attorney general of a State may bring a civil action in the name of such State, as parens patriae on behalf of natural persons residing in such State, in any district court of the United States having jurisdiction of the defendant, to secure monetary relief as provided in this section for injury sustained by such natural persons to their property by reason of any violation of [the Sherman Act]. The court shall exclude from the amount of monetary relief awarded in such action any amount of monetary relief

(A) which duplicates amounts which have been awarded for the same injury, or

(B) which is properly allocable to

(i) natural persons who have excluded their claims pursuant to subsection (b)(2) of this section, and

(ii) any business entity.

(2) The court shall award the State as monetary relief threefold the total damage sustained as described in paragraph (1) of this subsection, and the cost of suit, including a reasonable attorney's fee. The court may award under this paragraph, pursuant to a motion by such State promptly made, simple interest on the total damage for the period beginning on the date of service of such State's pleading setting forth a claim under the antitrust laws and ending on the date of judgment, or for any shorter period therein, if the court finds that the award of such interest for such period is just in the circumstances. In determining whether an award of interest under this paragraph for any period is just in the circumstances, the court shall consider only—

(A) whether such State or the opposing party, or either party's representative, made motions or asserted claims or defenses so lacking in merit as to show that such party or representative acted intentionally for delay or otherwise acted in bad faith;

(B) whether, in the course of the action involved, such State or the opposing party, or either party's representative, violated any applicable rule, statute, or court order providing for sanctions for dilatory behavior or otherwise providing for expeditious proceedings; and

(C) whether such State or the opposing party, or either party's representative, engaged in conduct primarily for the purpose of delaying the litigation or increasing the cost thereof.

(b)

(1) In any action brought under subsection (a)(1) of this section, the State attorney general shall, at such times, in such manner, and with such content as the court may direct, cause notice thereof to be given by publication. If the court finds that notice given solely by publication would deny due process of law to any person or persons, the court may direct further notice to such person or persons according to the circumstances of the case.

(2) Any person on whose behalf an action is brought under subsection (a)(1) of this section may elect to exclude from adjudication the portion of the State claim for monetary relief attributable to him by filing notice of such election with the court within such time as specified in the notice given pursuant to paragraph (1) of this subsection.

(3) The final judgment in an action under subsection (a)(1) of this section shall be res judicata as to any claim under section [4 of this Act] by any person on behalf of whom such action was brought and who fails to give such notice within the period specified in the notice given pursuant to paragraph (1) of this subsection.

(c) An action under subsection (a)(1) of this section shall not be dismissed or compromised without the approval of the court, and notice of any proposed dismissal or compromise shall be given in such manner as the court directs.

(d) In any action under subsection (a) of this section—

(1) the amount of the plaintiffs' attorney's fee, if any, shall be determined by the court; and

(2) the court may, in its discretion, award a reasonable attorney's fee to a prevailing defendant upon a finding that the State attorney general has acted in bad faith, vexatiously, wantonly, or for oppressive reasons.

15 U.S.C. § 15d (Section 4D of the Clayton Act)

In any action under section [4C](a)(1) of this [Act], in which there has been a determination that a defendant agreed to fix prices in violation of [the Sherman Act], damages may be proved and assessed in the aggregate by statistical or sampling methods, by the computation of illegal overcharges, or by such other reasonable system of estimating aggregate damages as the court in its discretion may permit without the necessity of separately proving the individual claim of, or amount of damage to, persons on whose behalf the suit was brought.

15 U.S.C. § 15e (Section 4E of the Clayton Act)

Monetary relief recovered in an action under section [4C](a)(1) of this [Act] shall—

(1) be distributed in such manner as the district court in its discretion may authorize; or

(2) be deemed a civil penalty by the court and deposited with the State as general revenues;

subject in either case to the requirement that any distribution procedure adopted afford each person a reasonable opportunity to secure his appropriate portion of the net monetary relief.

15 U.S.C. § 15f (Section 4F of the Clayton Act)

(a) Whenever the Attorney General of the United States has brought an action under the antitrust laws, and he has reason to believe that any State attorney general would be entitled to bring an action under this Act based substantially on the same alleged violation of the antitrust laws, he shall promptly give written notification thereof to such State attorney general.

(b) To assist a State attorney general in evaluating the notice or in bringing any action under this Act, the Attorney General of the United States shall, upon request by such State attorney general, make available to him, to the extent permitted by law, any investigative files or other materials which are or may be relevant or material to the actual or potential cause of action under this Act.

15 U.S.C. § 15g (Section 4G of the Clayton Act)

For the purposes of sections [4C, 4D, 4E, and 4F] of this [Act]:

(1) The term "State attorney general" means the chief legal officer of a State, or any other person authorized by State law to bring actions under section [4C] of this [Act], and includes the Corporation Counsel of the District of Columbia, except that such term does not include any person employed or retained on—

(A) a contingency fee based on a percentage of the monetary relief awarded under this section; or

(B) any other contingency fee basis, unless the amount of the award of a reasonable attorney's fee to a prevailing plaintiff is determined by the court under section [4C](d)(1) of this [Act].

(2) The term "State" means a State, the District of Columbia, the Commonwealth of Puerto Rico, and any other territory or possession of the United States.

(3) The term "natural persons" does not include proprietorships or partnerships.

15 U.S.C. § 15h (Section 4H of the Clayton Act)

Sections [4C, 4D, 4E, 4F, and 4G] of this [Act] shall apply in any State, unless such State provides by law for its nonapplicability in such State.

15 U.S.C. § 16 (Section 5 of the Clayton Act)

(a) A final judgment or decree heretofore or hereafter rendered in any civil or criminal proceeding brought by or on behalf of the United States under the antitrust laws to the effect that a defendant has violated said laws shall be prima facie evidence against such defendant in any action or proceeding brought by any other party against such defendant under said laws as to all matters respecting which said judgment or decree would be an estoppel as between the parties thereto: Provided, That this section shall not apply to consent judgments or decrees entered before any testimony has been taken. Nothing contained in this section shall be construed to impose any limitation on the application of collateral estoppel, except that, in any action or proceeding brought under the antitrust laws, collateral estoppel effect shall not be given to any finding made by the Federal Trade Commission under the antitrust laws or under section [5 of the Federal Trade Commission Act] which could give rise to a claim for relief under the antitrust laws.

(b) Any proposal for a consent judgment submitted by the United States for entry in any civil proceeding brought by or on behalf of the United States under the antitrust laws shall be filed with the district court before which such proceeding is pending and published by the United States in the Federal Register at least 60 days prior to the effective date of such judgment. Any written comments relating to such proposal and any responses by the United States thereto, shall also be filed with such district court and published by the United States in the Federal Register within such sixty-day period. Copies of such proposal and any other materials and documents which the United States considered determinative in formulating such proposal, shall also be made available to the public at the district court and in such other districts as the court may subsequently direct. Simultaneously with the filing of such proposal, unless otherwise instructed by the court, the United States shall file with the district court, publish in the Federal Register, and thereafter furnish to any person upon request, a competitive impact statement which shall recite—

(1) the nature and purpose of the proceeding;

(2) a description of the practices or events giving rise to the alleged violation of the antitrust laws;

(3) an explanation of the proposal for a consent judgment, including an explanation of any unusual circumstances giving rise to such proposal or any provision contained therein, relief to be obtained thereby, and the anticipated effects on competition of such relief;

(4) the remedies available to potential private plaintiffs damaged by the alleged violations in the event that such proposal for the consent judgment is entered in such proceeding;

(5) a description of the procedures available for modification of such proposal; and

(6) a description and evaluation of alternatives to such proposal actually considered by the United States.

(c) The United States shall also cause to be published, commencing at least 60 days prior to the effective date of the judgment described in subsection (b) of this section, for 7 days over a period of 2 weeks in newspapers of general circulation of the district in which the case has been filed, in the District of Columbia, and in such other districts as the court may direct—

(i) a summary of the terms of the proposal for consent judgment,

(ii) a summary of the competitive impact statement filed under subsection (b) of this section,

(iii) and a list of the materials and documents under subsection (b) of this section which the United States shall make available for purposes of meaningful public comment, and the place where such materials and documents are available for public inspection.

(d) During the 60-day period as specified in subsection (b) of this section, and such additional time as the United States may request and the court may grant, the United States shall receive and consider any written comments relating to the proposal for the consent judgment submitted under subsection (b) of this section. The Attorney General or his designee shall establish procedures to carry out the provisions of this subsection, but such 60-day time period shall not be shortened except by order of the district court upon a showing that

(1) extraordinary circumstances require such shortening and

(2) such shortening is not adverse to the public interest. At the close of the period during which such comments may be received, the United States shall file with the district court and cause to be published in the Federal Register a response to such comments.

(e) Before entering any consent judgment proposed by the United States under this section, the court shall determine that the entry of such judgment is in the public interest. For the purpose of such determination, the court may consider—

(1) the competitive impact of such judgment, including termination of alleged violations, provisions for enforcement and modification, duration or relief sought, anticipated effects of alternative remedies actually considered, and any other considerations bearing upon the adequacy of such judgment;

(2) the impact of entry of such judgment upon the public generally and individuals alleging specific injury from the violations set forth in the complaint including consideration of the public benefit, if any, to be derived from a determination of the issues at trial.

(f) In making its determination under subsection (e) of this section, the court may—

(1) take testimony of Government officials or experts or such other expert witnesses, upon motion of any party or participant or upon its own motion, as the court may deem appropriate;

(2) appoint a special master and such outside consultants or expert witnesses as the court may deem appropriate; and request and obtain the views, evaluations, or advice of any individual, group or agency of government with respect to any aspects of the proposed judgment or the effect of such judgment, in such manner as the court deems appropriate;

(3) authorize full or limited participation in proceedings before the court by interested persons or agencies, including appearance amicus curiae, intervention as a party pursuant to the Federal Rules of Civil Procedure, examination of witnesses or documentary materials, or participation in any other manner and extent which serves the public interest as the court may deem appropriate;

(4) review any comments including any objections filed with the United States under subsection (d) of this section concerning the proposed judgment and the responses of the United States to such comments and objections; and

(5) take such other action in the public interest as the court may deem appropriate.

(g) Not later than 10 days following the date of the filing of any proposal for a consent judgment under subsection (b) of this section, each defendant shall file with the district court a description of any and all written or oral communications by or on behalf of such defendant, including any and all written or oral communications on behalf of such defendant, or other person, with any officer or employee of the United States concerning or relevant to such proposal, except that any such communications made by counsel of record alone with the Attorney General or the employees of the Department of Justice alone shall be excluded from the requirements of this subsection. Prior to the entry of any consent judgment pursuant to the antitrust laws, each defendant shall certify to the district court that the requirements of this subsection have been complied with and that such filing is a true and complete description of such communications known to the defendant or which the defendant reasonably should have known.

(h) Proceedings before the district court under subsections (e) and (f) of this section, and the competitive impact statement filed under subsection (b) of this section, shall not be admissible against any defendant in any action or proceeding brought by any other party against such defendant under the antitrust laws or by the United States under section [4A] of this [Act] nor constitute a basis for the introduction of the consent judgment as prima facie evidence against such defendant in any such action or proceeding.

(i) Whenever any civil or criminal proceeding is instituted by the United States to prevent, restrain, or punish violations of any of the antitrust laws, but not including an action under section [4A] of this [Act], the running of the statute of limitations in respect to every private or State right of action arising under said laws and based in whole or in part on any matter complained of in said proceeding shall be suspended during the pendency thereof and for one year thereafter: Provided, however, That whenever the running of the statute of limitations in respect of a cause of action arising under section [4] or [4C] of this [Act] is suspended hereunder, any action to enforce such cause of action shall be forever barred unless commenced either within the period of suspension or within four years after the cause of action accrued.

15 U.S.C. § 18 (Section 7 of the Clayton Act)

No person engaged in commerce or in any activity affecting commerce shall acquire, directly or indirectly, the whole or any part of the stock or other share capital and no person subject to the jurisdiction of the Federal Trade Commission shall acquire the whole or any part of the assets of another person engaged also in commerce or in any activity affecting commerce, where in any line of commerce or in any activity affecting commerce in any section of the country, the effect of such acquisition may be substantially to lessen competition, or to tend to create a monopoly.

No person shall acquire, directly or indirectly, the whole or any part of the stock or other share capital and no person subject to the jurisdiction of the Federal Trade Commission shall acquire the whole or any part of the assets of one or more persons engaged in commerce or in any activity affecting commerce, where in any line of commerce or in any activity affecting commerce in any section of the country, the effect of such acquisition, of such stocks or assets, or of the use of such stock by the voting or granting of proxies or otherwise, may be substantially to lessen competition, or to tend to create a monopoly.

This section shall not apply to persons purchasing such stock solely for investment and not using the same by voting or otherwise to bring about, or in attempting to bring about, the substantial lessening of competition. Nor shall anything contained in this section prevent a corporation engaged in commerce or in any activity affecting commerce from causing the formation of subsidiary corporations for the actual carrying on of their immediate lawful business, or the natural and legitimate branches or extensions thereof, or from owning and holding all or a part of the stock of such subsidiary corporations, when the effect of such formation is not to substantially lessen competition.

Nor shall anything herein contained be construed to prohibit any common carrier subject to the laws to regulate commerce from aiding in the construction of branches or short lines so located as to become feeders to the main line of the company so aiding in such construction or from acquiring or owning all or any part of the stock of such branch lines, nor to prevent any such common carrier from acquiring and owning all or any part of the stock of a branch or short line constructed by an independent company where there is no substantial competition between the company owning the branch line so constructed and the company owning the main line acquiring the property or an interest therein, nor to prevent such common carrier from extending any of its lines through the medium of the acquisition of stock or otherwise of any other common carrier where there is no substantial competition between the company extending its lines and the company whose stock, property, or an interest therein is so acquired.

Nothing contained in this section shall be held to affect or impair any right heretofore legally acquired: Provided, That nothing in this section shall be held or construed to authorize or make lawful anything heretofore prohibited or made illegal by the antitrust laws, nor to exempt any person from the penal provisions thereof or the civil remedies therein provided.

Nothing contained in this section shall apply to transactions duly consummated pursuant to authority given by the Secretary of Transportation, Federal Power Commission, Surface Transportation Board, the Securities and Exchange Commission in the exercise of its jurisdiction under section [10 of the Public Utility Holding Company Act of 1955], the United States Maritime Commission, or the Secretary of Agriculture under any statutory provision vesting such power in such Commission, Board, or Secretary.

15 U.S.C. § 18a (Hart-Scott-Rodino Antitrust Improvements Act; Section 7A of the Clayton Act)

(a) Except as exempted pursuant to subsection (c) of this section, no person shall acquire, directly or indirectly, any voting securities or assets of any other person, unless both persons (or in the case of a tender offer, the acquiring person) file notification pursuant to rules under subsection (d)(1) of this section and the waiting period described in subsection (b)(1) of this section has expired, if—

  (1) the acquiring person, or the person whose voting securities or assets are being acquired, is engaged in commerce or in any activity affecting commerce; and

  (2) as a result of such acquisition, the acquiring person would hold an aggregate amount of the voting securities and assets of the acquired person—

    (A) in excess of $200,000,000 (as adjusted and published for each fiscal year beginning after September 30, 2004, in the same manner as provided in section 8(a)(5) [of the Act] to reflect the percentage change in the gross national product for such fiscal year compared to the gross national product for the year ending September 30, 2003); or

    (B)

      (i) in excess of $50,000,000 (as so adjusted and published) but not in excess of $200,000,000 (as so adjusted and published); and

      (ii)

        (I) any voting securities or assets of a person engaged in manufacturing which has annual net sales or total assets of $10,000,000 (as so adjusted and published) or more are being acquired by any person which has total assets or annual net sales of $100,000,000 (as so adjusted and published) or more;

        (II) any voting securities or assets of a person not engaged in manufacturing which has total assets of $10,000,000 (as so adjusted and published) or more are being acquired by any person which has total assets or annual net sales of $100,000,000 (as so adjusted and published) or more; or

(III) any voting securities or assets of a person with annual net sales or total assets of $100,000,000 (as so adjusted and published) or more are being acquired by any person with total assets or annual net sales of $10,000,000 (as so adjusted and published) or more.

In the case of a tender offer, the person whose voting securities are sought to be acquired by a person required to file notification under this subsection shall file notification pursuant to rules under subsection (d) of this section.

(b)

(1) The waiting period required under subsection (a) of this section shall—

(A) begin on the date of the receipt by the Federal Trade Commission and the Assistant Attorney General in charge of the Antitrust Division of the Department of Justice (hereinafter referred to in this section as the "Assistant Attorney General") of—

(i) the completed notification required under subsection (a) of this section, or

(ii) if such notification is not completed, the notification to the extent completed and a statement of the reasons for such noncompliance, from both persons, or, in the case of a tender offer, the acquiring person; and

(B) end on the thirtieth day after the date of such receipt (or in the case of a cash tender offer, the fifteenth day), or on such later date as may be set under subsection (e)(2) or (g)(2) of this section.

(2) The Federal Trade Commission and the Assistant Attorney General may, in individual cases, terminate the waiting period specified in paragraph (1) and allow any person to proceed with any acquisition subject to this section, and promptly shall cause to be published in the Federal Register a notice that neither intends to take any action within such period with respect to such acquisition.

(3) As used in this section—

(A) The term "voting securities" means any securities which at present or upon conversion entitle the owner or holder thereof to vote for the election of directors of the issuer or, with respect to unincorporated issuers, persons exercising similar functions.

(B) The amount or percentage of voting securities or assets of a person which are acquired or held by another person shall be determined by aggregating the amount or percentage of such voting securities or assets held or acquired by such other person and each affiliate thereof.

(c) The following classes of transactions are exempt from the requirements of this section—

(1) acquisitions of goods or realty transferred in the ordinary course of business;

(2) acquisitions of bonds, mortgages, deeds of trust, or other obligations which are not voting securities;

(3) acquisitions of voting securities of an issuer at least 50 per centum of the voting securities of which are owned by the acquiring person prior to such acquisition;

(4) transfers to or from a Federal agency or a State or political subdivision thereof;

(5) transactions specifically exempted from the antitrust laws by Federal statute;

(6) transactions specifically exempted from the antitrust laws by Federal statute

if approved by a Federal agency, if copies of all information and documentary material filed with such agency are contemporaneously filed with the Federal Trade Commission and the Assistant Attorney General;

(7) transactions which require agency approval under [§ 301 of the Financial Institutions Reform, Recovery, and Enforcement Act, 12 U.S.C. § 1467a(e), § 18(c) of the Federal Deposit Insurance Act, 12 U.S.C. § 1828(c), or § 3 of the Bank Holding Company Act of 1956, 12 U.S.C. § 1842], except that a portion of such a transaction is not exempt under this paragraph if such portion of the transaction

(A) is subject to [§ 103(a) of the Gramm-Leach-Bliley Act, 12 U.S.C. § 1843(k)]; and

(B) does not require agency approval under [§ 3 of the Bank Holding Company Act of 1956, 12 U.S.C. § 1842];

(8) transactions which require agency approval under [§ 4 of the Bank Holding Company Act of 1956, 12 U.S.C. § 1843, or § 5 of the Home Owners' Loan Act of 1933, 12 U.S.C. § 1464], if copies of all information and documentary material filed with any such agency are contemporaneously filed with the Federal Trade Commission and the Assistant Attorney General at least 30 days prior to consummation of the proposed transaction, except that a portion of such a transaction is not exempt under this paragraph if such portion of the transaction

(A) is subject to [§ 103(a) of the Gramm-Leach-Bliley Act, 12 U.S.C. § 1843(k)]; and

(B) does not require agency approval under [§ 3 of the Bank Holding Company Act of 1956, 12 U.S.C. § 1842];

(9) acquisitions, solely for the purpose of investment, of voting securities, if, as a result of such acquisition, the securities acquired or held do not exceed 10 per centum of the outstanding voting securities of the issuer;

(10) acquisitions of voting securities, if, as a result of such acquisition, the voting securities acquired do not increase, directly or indirectly, the acquiring person's per centum share of outstanding voting securities of the issuer;

(11) acquisitions, solely for the purpose of investment, by any bank, banking association, trust company, investment company, or insurance company, of

(A) voting securities pursuant to a plan of reorganization or dissolution; or

(B) assets in the ordinary course of its business; and

(12) such other acquisitions, transfers, or transactions, as may be exempted under subsection (d)(2)(B) of this section.

(d) The Federal Trade Commission, with the concurrence of the Assistant Attorney General and by rule in accordance with section 553 of Title 5, consistent with the purposes of this section—

(1) shall require that the notification required under subsection (a) of this section be in such form and contain such documentary material and information relevant to a proposed acquisition as is necessary and appropriate to enable the Federal Trade Commission and the Assistant Attorney General to determine whether such acquisition may, if consummated, violate the antitrust laws; and

(2) may—

(A) define the terms used in this section;

(B) exempt, from the requirements of this section, classes of persons, acquisitions, transfers, or transactions which are not likely to violate the antitrust laws; and

(C) prescribe such other rules as may be necessary and appropriate to carry out the purposes of this section.

(e)

(1)

(A) The Federal Trade Commission or the Assistant Attorney General may, prior to the expiration of the 30-day waiting period (or in the case of a cash tender offer, the 15-day waiting period) specified in subsection (b)(1) of this section, require the submission of additional information or documentary material relevant to the proposed acquisition, from a person required to file notification with respect to such acquisition under subsection (a) of this section prior to the expiration of the waiting period specified in subsection (b)(1) of this section, or from any officer, director, partner, agent, or employee of such person.

(B)

(i) The Assistant Attorney General and the Federal Trade Commission shall each designate a senior official who does not have direct responsibility for the review of any enforcement recommendation under this section concerning the transaction at issue, to hear any petition filed by such person to determine—

(I) whether the request for additional information or documentary material is unreasonably cumulative, unduly burdensome, or duplicative; or

(II) whether the request for additional information or documentary material has been substantially complied with by the petitioning person.

(ii) Internal review procedures for petitions filed pursuant to clause (i) shall include reasonable deadlines for expedited review of such petitions, after reasonable negotiations with investigative staff, in order to avoid undue delay of the merger review process.

(iii) Not later than 90 days after December 21, 2000, the Assistant Attorney General and the Federal Trade Commission shall conduct an internal review and implement reforms of the merger review process in order to eliminate unnecessary burden, remove costly duplication, and eliminate undue delay, in order to achieve a more effective and more efficient merger review process.

(iv) Not later than 120 days after December 21, 2000, the Assistant Attorney General and the Federal Trade Commission shall issue or amend their respective industry guidance, regulations, operating manuals and relevant policy documents, to the extent appropriate, to implement each reform in this subparagraph.

(v) Not later than 180 days after December 21, 2000, the Assistant Attorney General and the Federal Trade Commission shall each report to Congress—

(I) which reforms each agency has adopted under this subparagraph;

(II) which steps each has taken to implement such internal reforms; and

(III) the effects of such reforms.

(2) The Federal Trade Commission or the Assistant Attorney General, in its or his discretion, may extend the 30-day waiting period (or in the case of a cash tender offer, the 15-day waiting period) specified in subsection (b)(1) of this section for an additional period of not more than 30 days (or in the case of a cash tender offer, 10 days) after the date on which the Federal Trade Commission or the Assistant Attorney General, as the case may be, receives from any person to whom a request is made under paragraph (1), or in the case of tender offers, the acquiring person,

(A) all the information and documentary material required to be submitted pursuant to such a request, or

(B) if such request is not fully complied with, the information and documentary material submitted and a statement of the reasons for such noncompliance. Such additional period may be further extended only by the United States district court, upon an application by the Federal Trade Commission or the Assistant Attorney General pursuant to subsection (g)(2) of this section.

(f) If a proceeding is instituted or an action is filed by the Federal Trade Commission, alleging that a proposed acquisition violates [§ 7] of this [Act], or [§ 5 of the Federal Trade Commission Act], or an action is filed by the United States, alleging that a proposed acquisition violates such [§ 7] of this [Act], or section 1 or 2 of this [Act], and the Federal Trade Commission or the Assistant Attorney General

(1) files a motion for a preliminary injunction against consummation of such acquisition pendente lite, and

(2) certifies the United States district court for the judicial district within which the respondent resides or carries on business, or in which the action is brought, that it or he believes that the public interest requires relief pendente lite pursuant to this subsection, then upon the filing of such motion and certification, the chief judge of such district court shall immediately notify the chief judge of the United States court of appeals for the circuit in which such district court is located, who shall designate a United States district judge to whom such action shall be assigned for all purposes.

(g)

(1) Any person, or any officer, director, or partner thereof, who fails to comply with any provision of this section shall be liable to the United States for a civil penalty of not more than $10,000 for each day during which such person is in violation of this section. Such penalty may be recovered in a civil action brought by the United States.

(2) If any person, or any officer, director, partner, agent, or employee thereof, fails substantially to comply with the notification requirement under subsection (a) of this section or any request for the submission of additional information or documentary material under subsection (e)(1) of this section within the waiting period specified in subsection (b)(1) of this section and as may be extended under subsection (e)(2) of this section, the United States district court—

(A) may order compliance;

(B) shall extend the waiting period specified in subsection (b)(1) of this section and as may have been extended under subsection (e)(2) of this section until there has been substantial compliance, except that, in the case of a tender offer, the court may not extend such waiting period on the basis of a failure, by the person whose stock is sought to be acquired, to comply substantially with such notification requirement or any such request; and

(C) may grant such other equitable relief as the court in its discretion determines necessary or appropriate, upon application of the Federal Trade Commission or the Assistant Attorney General.

(h) Any information or documentary material filed with the Assistant Attorney General or the Federal Trade Commission pursuant to this section shall be exempt from disclosure under section 552 of title 5, and no such information or documentary material may be made public, except as may be relevant to any administrative or judicial action or proceeding. Nothing in this section is intended to prevent disclosure to either body of Congress or to any duly authorized committee or subcommittee of the Congress.

(i) (1) Any action taken by the Federal Trade Commission or the Assistant Attorney General or any failure of the Federal Trade Commission or the Assistant Attorney General to take any action under this section shall not bar any proceeding or any action with respect to such acquisition at any time under any other section of this Act or any other provision of law.

(2) Nothing contained in this section shall limit the authority of the Assistant Attorney General or the Federal Trade Commission to secure at any time from any person documentary material, oral testimony, or other information under the Antitrust Civil Process Act [15 U.S.C. §§ 1311 et seq.], the Federal Trade Commission Act [15 U.S.C. §§ 41 et seq.], or any other provision of law.

(j) Reserved.

(k) If the end of any period of time provided in this section falls on a Saturday, Sunday, or legal public holiday (as defined in section 6103(a) of title 5), then such period shall be extended to the end of the next day that is not a Saturday, Sunday, or legal public holiday.

15 U.S.C. § 18a note

(a) Five working days after enactment of this Act [Nov. 21, 1989] and thereafter, the Federal Trade Commission shall assess and collect filing fees established in subsection (b) which shall be paid by persons acquiring voting securities or assets who are required to file premerger notifications by the [sic] section 7A of the Clayton Act (15 U.S.C. 18a) and the regulations promulgated thereunder. For purposes of said Act, no notification shall be considered filed until payment of the fee required by this section. Fees collected pursuant to this section shall be divided evenly between and credited to the appropriations, Federal Trade Commission, 'Salaries and Expenses' and Department of Justice, 'Salaries and Expenses, Antitrust Division': Provided, That fees in excess of $40,000,000 in fiscal year 1990 shall be deposited to the credit of the Treasury of the United States: Provided further, That fees made available to the Federal Trade Commission and the Antitrust Division herein shall remain available until expended.

(b) The filing fees referred to in subsection (a) are—

(1) $45,000 if the aggregate total amount determined under section 7A(a)(2) of the Clayton Act (15 U.S.C. 18a (a)(2)) is less than $100,000,000 (as adjusted and published for each fiscal year beginning after September 30, 2004, in the same manner as provided in section 8(a)(5) of the Clayton Act (15 U.S.C. 19 (a)(5)) to reflect the percentage change in the gross national product for such fiscal year compared to the gross national product for the year ending September 30, 2003);

(2) $125,000 if the aggregate total amount determined under section 7A(a)(2) of the Clayton Act (15 U.S.C. 18a (a)(2)) is not less than $100,000,000 (as so adjusted and published) but less than $500,000,000 (as so adjusted and published); and

(3) $280,000 if the aggregate total amount determined under section 7A(a)(2) of the Clayton Act (15 U.S.C. 18a (a)(2)) is not less than $500,000,000 (as so adjusted and published).

15 U.S.C. § 25 (Section 15 of the Clayton Act)

The several district courts of the United States are invested with jurisdiction to prevent and restrain violations of this Act, and it shall be the duty of the several United States attorneys, in their respective districts, under the direction of the Attorney General, to institute proceedings in equity to prevent and restrain such violations. Such proceedings may be by way of petition setting forth the case and praying that such violation shall be enjoined or otherwise prohibited. When the parties complained of shall have been duly notified of such petition, the court shall proceed, as soon as may be, to the hearing and determination of the case; and pending such petition, and before final decree, the court may at any time make such temporary restraining order or prohibition as shall be deemed just in the premises. Whenever it shall appear to the court before which any such proceeding may be pending that the ends of justice require that other parties should be brought before the court, the court may cause them to be summoned whether they reside in the district in which the court is held or not, and subpoenas to that end may be served in any district by the marshal thereof.

15 U.S.C. § 26 (Section 16 of the Clayton Act)

Any person, firm, corporation, or association shall be entitled to sue for and have injunctive relief, in any court of the United States having jurisdiction over the parties, against threatened loss or damage by a violation of the antitrust laws, including sections [2, 3, 7, and 8] of this [Act], when and under the same conditions and principles as injunctive relief against threatened conduct that will cause loss or damage is granted by courts of equity, under the rules governing such proceedings, and upon the execution of proper bond against damages for an injunction improvidently granted and a showing that the danger of irreparable loss or damage is immediate, a preliminary injunction may issue: Provided, That nothing herein contained shall be construed to entitle any person, firm, corporation, or association, except the United States, to bring suit for injunctive relief against any common carrier subject to the jurisdiction of the Surface Transportation Board under subtitle IV of Title 49. In any action under this section in which the plaintiff substantially prevails, the court shall award the cost of suit, including a reasonable attorney's fee, to such plaintiff.

Robinson-Patman Act

15 U.S.C. § 13 (Section 1 of the Robinson-Patman Act)

(a) It shall be unlawful for any person engaged in commerce, in the course of such commerce, either directly or indirectly, to discriminate in price between different purchasers of commodities of like grade and quality, where either or any of the purchases involved in such discrimination are in commerce, where such commodities are sold for use, consumption, or resale within the United States or any Territory thereof or the District of Columbia or any insular possession or other place under the jurisdiction of the United States, and where the effect of such discrimination may be substantially to lessen competition or tend to create a monopoly in any line of commerce, or to injure, destroy, or prevent competition with any person who either grants or knowingly receives the benefit of such discrimination, or with customers of either of them: Provided, That nothing herein contained shall prevent differentials which make only due allowance for differences in the cost of manufacture, sale, or delivery resulting from the differing methods or quantities in which such commodities are to such purchasers sold or delivered: Provided, however, That the Federal Trade Commission may, after due investigation and hearing to all interested parties, fix and establish quantity limits, and revise the same as it finds necessary, as to particular commodities or classes of commodities, where it finds that available purchasers in greater quantities are so few as to render differentials on account thereof unjustly discriminatory or promotive of monopoly in any line of commerce; and the foregoing shall then not be construed to permit differentials based on differences in quantities greater than those so fixed and established: And provided further, That nothing herein contained shall prevent persons engaged in selling goods, wares, or merchandise in commerce from selecting their own customers in bona fide transactions and not in restraint of trade: And provided further, That nothing herein contained shall prevent price changes from time to time where in response to changing conditions affecting the market for or the marketability of the goods concerned, such as but not limited to actual or imminent deterioration of perishable goods, obsolescence of seasonal goods, distress sales under court process, or sales in good faith in discontinuance of business in the goods concerned.

(b) Upon proof being made, at any hearing on a complaint under this section, that there has been discrimination in price or services or facilities furnished, the burden of rebutting the prima-facie case thus made by showing justification shall be upon the person charged with a violation of this section, and unless justification shall be affirmatively shown, the Commission is authorized to issue an order terminating the discrimination: Provided, however, That nothing herein contained shall prevent a seller rebutting the prima-facie case thus made by showing that his lower price or the furnishing of services or facilities to any purchaser or purchasers was made in good faith to meet an equally low price of a competitor, or the services or facilities furnished by a competitor.

(c) It shall be unlawful for any person engaged in commerce, in the course of such commerce, to pay or grant, or to receive or accept, anything of value as a commission, brokerage, or other compensation, or any allowance or discount in lieu thereof, except for services rendered in connection with the sale or purchase of goods, wares, or merchandise, either to the other party to such transaction or to an agent, representative, or other intermediary therein where such intermediary is acting in fact for or in behalf, or is subject to the direct or indirect control, of any party to such transaction other than the person by whom such compensation is so granted or paid.

(d) It shall be unlawful for any person engaged in commerce to pay or contract for the payment of anything of value to or for the benefit of a customer of such person in the course of such commerce as compensation or in consideration for any services or facilities furnished by or through such customer in connection with the processing, handling, sale, or offering for sale of any products or commodities manufactured, sold, or offered for sale by such person, unless such payment or consideration is available on proportionally equal terms to all other customers competing in the distribution of such products or commodities.

(e) It shall be unlawful for any person to discriminate in favor of one purchaser against another purchaser or purchasers of a commodity bought for resale, with or without processing, by contracting to furnish or furnishing, or by contributing to the furnishing of, any services or facilities connected with the processing, handling, sale, or offering for sale of such commodity so purchased upon terms not accorded to all purchasers on proportionally equal terms.

(f) It shall be unlawful for any person engaged in commerce, in the course of such commerce, knowingly to induce or receive a discrimination in price which is prohibited by this section.

15 U.S.C. § 13a (Section 3 of the Robinson-Patman Act)

It shall be unlawful for any person engaged in commerce, in the course of such commerce, to be a party to, or assist in, any transaction of sale, or contract to sell, which discriminates to his knowledge against competitors of the purchaser, in that, any discount, rebate, allowance, or advertising service charge is granted to the purchaser over and above any discount, rebate, allowance, or advertising service charge available at the time of such transaction to said competitors in respect of a sale of goods of like grade, quality, and quantity; to sell, or contract to sell, goods in any part of the United States at prices lower than those exacted by said person elsewhere in the United States for the purpose of destroying competition, or eliminating a competitor in such part of the United States; or, to sell, or contract to sell, goods at unreasonably low prices for the purpose of destroying competition or eliminating a competitor.

Any person violating any of the provisions of this section shall, upon conviction thereof, be fined not more than $5,000 or imprisoned not more than one year, or both.

Federal Trade Commission Act

15 U.S.C. § 41 (Section 1 of the Federal Trade Commission Act)

A commission is created and established, to be known as the Federal Trade Commission (hereinafter referred to as the Commission), which shall be composed of five Commissioners, who shall be appointed by the President, by and with the advice and consent of the Senate. Not more than three of the Commissioners shall be members of the same political party. The first Commissioners appointed shall continue in office for terms of three, four, five, six, and seven years, respectively, from September 26, 1914, the term of each to be designated by the President, but their successors shall be appointed for terms of seven years, except that any person chosen to fill a vacancy shall be appointed only for the unexpired term of the Commissioner whom he shall succeed: Provided, however, That upon the expiration of his term of office a Commissioner shall continue to serve until his successor shall have been appointed and shall have qualified. The President shall choose a chairman from the Commission's membership. No Commissioner shall engage in any other business, vocation, or employment. Any Commissioner may be removed by the President for inefficiency, neglect of duty, or malfeasance in office. A vacancy in the Commission shall not impair the right of the remaining Commissioners to exercise all the powers of the Commission.

The Commission shall have an official seal, which shall be judicially noticed.

15 U.S.C. § 45 (Section 5 of the Federal Trade Commission Act)

(a)

(1) Unfair methods of competition in or affecting commerce, and unfair or deceptive acts or practices in or affecting commerce, are declared unlawful.

(2) The Commission is empowered and directed to prevent persons, partnerships, or corporations, except banks, savings and loan institutions described in section 57a(f)(3) of this title, Federal credit unions described in section 57a(f)(4) of this title, common carriers subject to the Acts to regulate commerce, air carriers and foreign air carriers subject to the Federal Aviation Act of 1958 [49 App. U.S.C. §§ 1301 et seq.], and persons, partnerships, or corporations insofar as they are subject to the Packers and Stockyards Act, 1921, as amended [7 U.S.C. §§ 181 et seq.], except as provided in section 406(b) of said Act [7 U.S.C. § 227(b)], from using unfair methods of competition in or affecting commerce and unfair or deceptive acts or practices in or affecting commerce.

(3) This subsection shall not apply to unfair methods of competition involving commerce with foreign nations (other than import commerce) unless—

(A) such methods of competition have a direct, substantial, and reasonably foreseeable effect—

(i) on commerce which is not commerce with foreign nations, or on import commerce with foreign nations; or

(ii) on export commerce with foreign nations, of a person engaged in such commerce in the United States; and

(B) such effect gives rise to a claim under the provisions of this subsection, other than this paragraph.

If this subsection applies to such methods of competition only because of the operation of subparagraph (A)(ii), this subsection shall apply to such conduct only for injury to export business in the United States.

(b) Whenever the Commission shall have reason to believe that any such person, partnership, or corporation has been or is using any unfair method of competition or unfair or deceptive act or practice in or affecting commerce, and if it shall appear to the Commission that a proceeding by it in respect thereof would be to the interest of the public, it shall issue and serve upon such persons, partnership, or corporation a complaint stating its charges in that respect and containing a notice of a hearing upon a day and at a place therein fixed at least thirty days after the service of said complaint. The person, partnership, or corporation so complained of shall have the right to appear at the place and time so fixed and show cause why an order should not be entered by the Commission requiring such person, partnership, or corporation to cease and desist from the violation of the law so charged in said complaint. Any person, partnership, or corporation may make application, and upon good cause shown may be allowed by the Commission to intervene and appear in said proceeding by counsel or in person. The testimony in any such proceeding shall be reduced to writing and filed in the office of the Commission. If upon such hearing the Commission shall be of the opinion that the method of competition or the act or practice in question is prohibited by this subchapter, it shall make a report in writing in which it shall state its findings as to the facts and shall issue and cause to be served on such person, partnership, or corporation an order requiring such person, partnership, or corporation to cease and desist from using such method of competition or such act or practice. Until the expiration of the time allowed for filing a petition for review, if no such petition has been duly filed within such time, or, if a petition for review has been filed within such time then until the record in the proceeding has been filed in a court of appeals of the United States, as hereinafter provided, the Commission may at any time, upon such notice and in such manner as it shall deem proper, modify or set aside, in whole or in part, any report or any order made or issued by it under this section. After the expiration of the time allowed for filing a petition for review, if no such petition has been duly filed within such time, the Commission may at any time, after notice, and opportunity for hearing, reopen and alter, modify, or set aside, in whole or in part, any report or order made or issued by it under this section, whenever in the opinion of the Commission conditions of fact or of law have so changed as to require such action or if the public interest shall so require, except that

(1) the said person, partnership, or corporation may, within sixty days after service upon him or it of said report or order entered after such a reopening, obtain a review thereof in the appropriate court of appeals in the United States, in the manner provided in subsection (c) of this section; and

(2) in the case of an order, the Commission shall reopen any such order to consider whether such order (including any affirmative relief provision contained in such order) should be altered, modified, or set aside, in whole or in part, if the person, partnership, or corporation involved files a request with the Commission which makes a satisfactory showing that changed conditions of law or fact require such order to be altered, modified, or set aside, in whole or in part. The Commission shall determine whether to alter, modify, or set aside any order of the Commission in response to a request made by a person, partnership, or corporation under paragraph (2) not later than 120 days after the date of the filing of such request.

(c) Any person, partnership, or corporation required by an order of the Commission to cease and desist from using any method of competition or act or practice may obtain a review of such order in the court of appeals of the United States, within any circuit where the method of competition or the act or practice in question was used or where such person, partnership, or corporation resides or carries on business, by filing in the court, within sixty days from the date of the service of such order, a written petition praying that the order of the Commission be set aside. A copy of such petition shall be forthwith transmitted by the clerk of the court to the Commission, and thereupon the Commission shall file in the court the record in the proceeding, as provided in section 2112 of Title 28 [the U.S. Code]. Upon such filing of the petition the court shall have jurisdiction of the proceeding and of the question determined therein concurrently with the Commission until the filing of the record and shall have the power to make and enter a decree affirming, modifying, or setting aside the order of the Commission, and enforcing the same to the extent that such order is affirmed and to issue such writs as are ancillary to its jurisdiction or are necessary in its judgment to prevent injury to the public or to competitors pendente lite. The findings of the Commission as to the facts, if supported by evidence, shall be conclusive. To the extent that the order of the Commission is affirmed, the court shall thereupon issue its own order commending obedience to the terms of such order of the Commission. If either party shall apply to the court for leave to adduce additional evidence, and shall show to the satisfaction of the court that such additional evidence is material and that there were reasonable grounds for the failure to adduce such evidence in the proceeding before the Commission, the court may order such additional evidence to be taken before the Commission and to be adduced upon the hearing in such manner and upon such terms and conditions as to the court may seem proper. The Commission may modify its findings as to the facts, or make new findings, by reason of the additional evidence so taken, and it shall file such modified or new findings, which, if supported by evidence, shall be conclusive, and its recommendation, if any, for the modification or setting aside of its original order, with the return of such additional evidence. The judgment and decree of the court shall be final, except that the same shall be subject to review by the Supreme Court upon certiorari, as provided in section 347 of Title 28 [of the U.S. Code].

(d) Upon the filing of the record with it the jurisdiction of the court of appeals of the United States to affirm, enforce, modify, or set aside orders of the Commission shall be exclusive.

(e) No order of the Commission or judgment of court to enforce the same shall in anywise relieve or absolve any person, partnership, or corporation from any liability under the Antitrust Acts.

(f) Complaints, orders, and other processes of the Commission under this section may be served by anyone duly authorized by the Commission, either

 (a) by delivering a copy thereof to the person to be served, or to a member of the partnership to be served, or the president, secretary, or other executive officer or a director of the corporation to be served; or

 (b) by leaving a copy thereof at the residence or the principal office or place of business of such person, partnership, or corporation; or

(c) by mailing a copy thereof by registered mail or by certified mail addressed to such person, partnership, or corporation at his or its residence or principal office or place of business. The verified return by the person so serving said complaint, order, or other process setting forth the manner of said service shall be proof of the same, and the return post office receipt of said complaint, order, or other process mailed by registered mail or by certified mail as aforesaid shall be proof of the service of the same.

(g) An order of the Commission to cease and desist shall become final—

(1) Upon the expiration of the time allowed for filing a petition for review, if no such petition has been duly filed within such time; but the Commission may thereafter modify or set aside its order to the extent provided in the last sentence of subsection (b) of this section.

(2) Except as to any order provision subject to paragraph (4), upon the sixtieth day after such order is served, if a petition for review has been duly filed; except that any such order may be stayed, in whole or in part and subject to such conditions as may be appropriate, by—

(A) the Commission;

(B) an appropriate court of appeals of the United States, if

(i) a petition for review of such order is pending in such court, and

(ii) an application for such a stay was previously submitted to the Commission and the Commission, within the 30-day period beginning on the date the application was received by the Commission, either denied the application or did not grant or deny the application; or

(C) the Supreme Court, if an applicable petition for certiorari is pending.

(3) For purposes of subsection (m)(1)(B) of this section and of section 57b(a)(2) of this title, if a petition for review of the order of the Commission has been filed—

(A) upon the expiration of the time allowed for filing a petition for certiorari, if the order of the Commission has been affirmed or the petition for review has been dismissed by the court of appeals and no petition for certiorari has been duly filed;

(B) upon the denial of a petition for certiorari, if the order of the Commission has been affirmed or the petition for review has been dismissed by the court of appeals; or

(C) upon the expiration of 30 days from the date of issuance of a mandate of the Supreme Court directing that the order of the Commission be affirmed or the petition for review be dismissed.

(4) In the case of an order provision requiring a person, partnership, or corporation to divest itself of stock, other share capital, or assets, if a petition for review of such order of the Commission has been filed—

(A) upon the expiration of the time allowed for filing a petition for certiorari, if the order of the Commission has been affirmed or the petition for review has been dismissed by the court of appeals and no petition for certiorari has been duly filed;

(B) upon the denial of a petition for certiorari, if the order of the Commission has been affirmed or the petition for review has been dismissed by the court of appeals; or

(C) upon the expiration of 30 days from the date of issuance of a mandate of the Supreme Court directing that the order of the Commission be affirmed or the petition for review be dismissed.

(h) If the Supreme Court directs that the order of the Commission be modified or set aside, the order of the Commission rendered in accordance with the mandate of the Supreme Court shall become final upon the expiration of thirty days from the time it was rendered, unless within such thirty days either party has instituted proceedings to have such order corrected to accord with the mandate, in which event the order of the Commission shall become final when so corrected.

(i) If the order of the Commission is modified or set aside by the court of appeals, and if

(1) the time allowed for filing a petition for certiorari has expired and no such petition has been duly filed, or

(2) the petition for certiorari has been denied, or

(3) the decision of the court has been affirmed by the Supreme Court, then the order of the Commission rendered in accordance with the mandate of the court of appeals shall become final on the expiration of thirty days from the time such order of the Commission was rendered, unless within such thirty days either party has instituted proceedings to have such order corrected so that it will accord with the mandate, in which event the order of the Commission shall become final when so corrected.

(j) If the Supreme Court orders a rehearing; or if the case is remanded by the court of appeals to the Commission for a rehearing; and if

(1) the time allowed for filing a petition for certiorari has expired, and no such petition has been duly filed, or

(2) the petition for certiorari has been denied, or

(3) the decision of the court has been affirmed by the Supreme Court, then the order of the Commission rendered upon such rehearing shall become final in the same manner as though no prior order of the Commission had been rendered.

(k) As used in this section the term "mandate", in case a mandate has been recalled prior to the expiration of thirty days from the date of issuance thereof, means the final mandate.

(l) Any person, partnership, or corporation who violates an order of the Commission after it has become final, and while such order is in effect, shall forfeit and pay to the United States a civil penalty of not more than $10,000 for each violation, which shall accrue to the United States and may be recovered in a civil action brought by the Attorney General of the United States. Each separate violation of such an order shall be a separate offense, except that in a case of a violation through continuing failure to obey or neglect to obey a final order of the Commission, each day of continuance of such failure or neglect shall be deemed a separate offense. In such actions, the United States district courts are empowered to grant mandatory injunctions and such other and further equitable relief as they deem appropriate in the enforcement of such final orders of the Commission.

(m)

(1)

(A) The Commission may commence a civil action to recover a civil penalty in a district court of the United States against any person, partnership, or corporation which violates any rule under this chapter respecting unfair or deceptive acts or practices (other than an interpretive rule or a rule violation of which the Commission has provided is not an unfair or deceptive act or practice in violation of subsection (a)(1) of this section) with actual knowledge or knowledge fairly implied on the basis of objective circumstances that such act is unfair or deceptive and is prohibited by such rule. In such action, such person, partnership, or corporation shall be liable for a civil penalty of not more than $10,000 for each violation.

(B) If the Commission determines in a proceeding under subsection (b) of this section that any act or practice is unfair or deceptive, and issues a final cease and desist order, other than a consent order with respect to such act or practice, then the Commission may commence a civil action to obtain a civil penalty in a district court of the United States against any person, partnership, or corporation which engages in such act or practice—

(1) after such cease and desist order becomes final (whether or not such person, partnership, or corporation was subject to such cease and desist order), and

(2) with actual knowledge that such act or practice is unfair or deceptive and is unlawful under subsection (a)(1) of this section.

In such action, such person, partnership, or corporation shall be liable for a civil penalty of not more than $10,000 for each violation.

(C) In the case of a violation through continuing failure to comply with a rule or with subsection (a)(1) of this section, each day of continuance of such failure shall be treated as a separate violation, for purposes of subparagraph (A) and (B). In determining the amount of such a civil penalty, the court shall take into account the degree of culpability, any history of prior such conduct, ability to pay, effect on ability to continue to do business, and such other matters as justice may require.

(2) If the cease and desist order establishing that the act or practice is unfair or deceptive was not issued against the defendant in a civil penalty action under paragraph (1)(B) the issues of fact in such action against such defendant shall be tried de novo. Upon request of any party to such an action against such defendant, the court shall also review the determination of law made by the Commission in the proceeding under subsection (b) of this section that the act or practice which was the subject of such proceeding constituted an unfair or deceptive act or practice in violation of subsection (a) of this section.

(3) The Commission may compromise or settle any action for a civil penalty if such compromise or settlement is accompanied by public statement of its reasons and is approved by the court.

(n) The Commission shall have no authority under this section or section 57a of this title to declare unlawful an act or practice on the grounds that such act or practice is unfair unless the act or practice causes or is likely to cause substantial injury to consumers which is not reasonably avoidable by consumers themselves and not outweighed by countervailing benefits to consumers or to competition. In determining whether an act or practice is unfair, the Commission may consider established public policies as evidence to be considered with all other evidence. Such public policy considerations may not serve as a primary basis for such determination.

15 U.S.C. § 53 (Section 13 of the Federal Trade Commission Act)

(a) Whenever the Commission has reason to believe—
    (1) that any person, partnership, or corporation is engaged in, or is about to engage in, the dissemination or the causing of the dissemination of any advertisement in violation of section 52 of this title, and
    (2) that the enjoining thereof pending the issuance of a complaint by the Commission under section 45 of this title, and until such complaint is dismissed by the Commission or set aside by the court on review, or the order of the Commission to cease and desist made thereon has become final within the meaning of section 45 of this title, would be to the interest of the public, the Commission by any of its attorneys designated by it for such purpose may bring suit in a district court of the United States or in the United States court of any Territory, to enjoin the dissemination or the causing of the dissemination of such advertisement. Upon proper showing a temporary injunction or restraining order shall be granted without bond. Any suit may be brought where such person, partnership, or corporation resides or transacts business, or wherever venue is proper under section 1391 of title 28. In addition, the court may, if the court determines that the interests of justice require that any other person, partnership, or corporation should be a party in such suit, cause such other person, partnership, or corporation to be added as a party without regard to whether venue is otherwise proper in the district in which the suit is brought. In any suit under this section, process may be served on any person, partnership, or corporation wherever it may be found.

(b) Whenever the Commission has reason to believe—
    (1) that any person, partnership, or corporation is violating, or is about to violate, any provision of law enforced by the Federal Trade Commission, and
    (2) that the enjoining thereof pending the issuance of a complaint by the Commission and until such complaint is dismissed by the Commission or set aside by the court on review, or until the order of the Commission made thereon has become final, would be in the interest of the public—

    the Commission by any of its attorneys designated by it for such purpose may bring suit in a district court of the United States to enjoin any such act or practice. Upon a proper showing that, weighing the equities and considering the Commission's likelihood of ultimate success, such action would be in the public interest, and after notice to the defendant, a temporary restraining order or a preliminary injunction may be granted without bond: Provided, however, That if a complaint is not filed within such period (not exceeding 20 days) as may be specified by the court after issuance of the temporary restraining order or preliminary injunction, the order or injunction shall be dissolved by the court and be of no further force and effect: Provided further, That in proper cases the Commission may seek, and after proper proof, the court may issue, a permanent injunction. Any suit may be brought where such person, partnership, or corporation resides or transacts business, or wherever venue is proper under section 1391 of Title 28. In addition, the court may, if the court determines that the interests of justice require that any other person, partnership, or corporation should be a party in such suit, cause such other person, partnership, or corporation to be added as a party without regard to whether venue is otherwise proper in the district in which the suit is brought. In any suit under this section, process may be served on any person, partnership, or corporation wherever it may be found.

(c) Any process of the Commission under this section may be served by any person duly authorized by the Commission—

(1) by delivering a copy of such process to the person to be served, to a member of the partnership to be served, or to the president, secretary, or other executive officer or a director of the corporation to be served;

(2) by leaving a copy of such process at the residence or the principal office or place of business of such person, partnership, or corporation; or

(3) by mailing a copy of such process by registered mail or certified mail addressed to such person, partnership, or corporation at his, or her, or its residence, principal office, or principal place or business.

The verified return by the person serving such process setting forth the manner of such service shall be proof of the same.

(d) Whenever it appears to the satisfaction of the court in the case of a newspaper, magazine, periodical, or other publication, published at regular intervals—

(1) that restraining the dissemination of a false advertisement in any particular issue of such publication would delay the delivery of such issue after the regular time therefor, and

(2) that such delay would be due to the method by which the manufacture and distribution of such publication is customarily conducted by the publisher in accordance with sound business practice, and not to any method or device adopted for the evasion of this section or to prevent or delay the issuance of an injunction or restraining order with respect to such false advertisement or any other advertisement, the court shall exclude such issue from the operation of the restraining order or injunction.

Foreign Trade Antitrust Improvements Act of 1982

15 U.S.C. § 6a

[The Sherman Act] shall not apply to conduct involving trade or commerce (other than import trade or import commerce) with foreign nations unless—

(1) such conduct has a direct, substantial, and reasonably foreseeable effect—

 (A) on trade or commerce which is not trade or commerce with foreign nations, or on import trade or import commerce with foreign nations; or

 (B) on export trade or export commerce with foreign nations, of a person engaged in such trade or commerce in the United States; and

(2) such effect gives rise to a claim under the provisions of [the Sherman Act], other than this section.

 If [the Sherman Act applies] to such conduct only because of the operation of paragraph (1)(B), then [the Sherman Act] shall apply to such conduct only for injury to export business in the United States.

International Antitrust Enforcement Assistance Act of 1994 (IAEAA)

15 U.S.C. § 6201 (Section 2 of the IAEAA)

In accordance with an antitrust mutual assistance agreement in effect under this chapter, subject to section 6207 of this title, and except as provided in section 6204 of this title, the Attorney General of the United States and the Federal Trade Commission may provide to a foreign antitrust authority with respect to which such agreement is in effect under this chapter, antitrust evidence to assist the foreign antitrust authority—

(1) in determining whether a person has violated or is about to violate any of the foreign antitrust laws administered or enforced by the foreign antitrust authority, or

(2) in enforcing any of such foreign antitrust laws.

15 U.S.C. § 6202 (Section 3 of the IAEAA)

(a) Request for investigative assistance

 A request by a foreign antitrust authority for investigative assistance under this section shall be made to the Attorney General, who may deny the request in whole or in part. No further action shall be taken under this section with respect to any part of a request that has been denied by the Attorney General.

(b) Authority to investigate

 In accordance with an antitrust mutual assistance agreement in effect under this chapter, subject to section 6207 of this title, and except as provided in section 6204 of this title, the Attorney General and the Commission may, using their respective authority to investigate possible violations of the Federal antitrust laws, conduct investigations to obtain antitrust evidence relating to a possible violation of the foreign antitrust laws administered or enforced by the foreign antitrust authority with respect to which such agreement is in effect under this chapter, and may provide such antitrust evidence to the foreign antitrust authority, to assist the foreign antitrust authority—

(1) in determining whether a person has violated or is about to violate any of such foreign antitrust laws, or

(2) in enforcing any of such foreign antitrust laws.

(c) Special scope of authority

An investigation may be conducted under subsection (b) of this section, and antitrust evidence obtained through such investigation may be provided, without regard to whether the conduct investigated violates any of the Federal antitrust laws.

(d) Rights and privileges preserved

A person may not be compelled in connection with an investigation under this section to give testimony or a statement, or to produce a document or other thing, in violation of any legally applicable right or privilege.

15 U.S.C. § 6203 (Section 4 of the IAEAA)

(a) Authority of district courts

On the application of the Attorney General made in accordance with an antitrust mutual assistance agreement in effect under this chapter, the United States district court for the district in which a person resides, is found, or transacts business may order such person to give testimony or a statement, or to produce a document or other thing, to the Attorney General to assist a foreign antitrust authority with respect to which such agreement is in effect under this chapter—

(1) in determining whether a person has violated or is about to violate any of the foreign antitrust laws administered or enforced by the foreign antitrust authority, or

(2) in enforcing any of such foreign antitrust laws.

(b) Contents of order

(1) Use of appointee to receive evidence

(A) An order issued under subsection (a) of this section may direct that testimony or a statement be given, or a document or other thing be produced, to a person who shall be recommended by the Attorney General and appointed by the court.

(B) A person appointed under subparagraph (A) shall have power to administer any necessary oath and to take such testimony or such statement.

(2) Practice and procedure

(A) An order issued under subsection (a) of this section may prescribe the practice and procedure for taking testimony and statements and for producing documents and other things.

(B) Such practice and procedure may be in whole or in part the practice and procedure of the foreign state, or the regional economic integration organization, represented by the foreign antitrust authority with respect to which the Attorney General requests such order.

(C) To the extent such order does not prescribe otherwise, any testimony and statements required to be taken shall be taken, and any documents and other things required to be produced shall be produced, in accordance with the Federal Rules of Civil Procedure.

(c) Rights and privileges preserved

A person may not be compelled under an order issued under subsection (a) of this section to give testimony or a statement, or to produce a document or other thing, in violation of any legally applicable right or privilege.

(d) Voluntary conduct

This section does not preclude a person in the United States from voluntarily giving testimony or a statement, or producing a document or other thing, in any manner acceptable to such person for use in an investigation by a foreign antitrust authority.

15 U.S.C. § 6204 (Section 5 of the IAEAA)

Sections 6201, 6202, and 6203 of this title shall not apply with respect to the following antitrust evidence:

(1) Antitrust evidence that is received by the Attorney General or the Commission under section 18a of this title. Nothing in this paragraph shall affect the ability of the Attorney General or the Commission to disclose to a foreign antitrust authority antitrust evidence that is obtained otherwise than under section 18a of this title.

(2) Antitrust evidence that is matter occurring before a grand jury and with respect to which disclosure is prevented by Federal law, except that for the purpose of applying Rule 6(e)(3)(C)(iv) of the Federal Rules of Criminal Procedure with respect to this section—

    (A) a foreign antitrust authority with respect to which a particularized need for such antitrust evidence is shown shall be considered to be an appropriate official of any of the several States, and

    (B) a foreign antitrust law administered or enforced by the foreign antitrust authority shall be considered to be a State criminal law.

(3) Antitrust evidence that is specifically authorized under criteria established by Executive Order 12356, or any successor to such order, to be kept secret in the interest of national defense or foreign policy, and—

    (A) that is classified pursuant to such order or such successor, or

    (B) with respect to which a determination of classification is pending under such order or such successor.

(4) Antitrust evidence that is classified under section 2162 of title 42.

15 U.S.C. § 6205 (Section 6 of the IAEAA)

Section 1313 of this title, and sections 46 (f) and 57b-2 of this title, shall not apply to prevent the Attorney General or the Commission from providing to a foreign antitrust authority antitrust evidence in accordance with an antitrust mutual assistance agreement in effect under this chapter and in accordance with the other requirements of this chapter.

15 U.S.C. § 6206 (Section 7 of the IAEAA)

(a) Publication of proposed antitrust mutual assistance agreements

Not less than 45 days before an antitrust mutual assistance agreement is entered into, the Attorney General, with the concurrence of the Commission, shall publish in the Federal Register—

(1) the proposed text of such agreement and any modification to such proposed text, and

(2) a request for public comment with respect to such text or such modification, as the case may be.

(b) Publication of proposed amendments to antitrust mutual assistance agreements in effect

Not less than 45 days before an agreement is entered into that makes an amendment to an antitrust mutual assistance agreement, the Attorney General, with the concurrence of the Commission, shall publish in the Federal Register—

(1) the proposed text of such amendment, and

(2) a request for public comment with respect to such amendment.

(c) Publication of antitrust mutual assistance agreements, amendments, and terminations

Not later than 45 days after an antitrust mutual assistance agreement is entered into or terminated, or an agreement that makes an amendment to an antitrust mutual assistance agreement is entered into, the Attorney General, with the concurrence of the Commission, shall publish in the Federal Register—

(1) the text of the antitrust mutual assistance agreement or amendment, or the terms of the termination, as the case may be, and

(2) in the case of an agreement that makes an amendment to an antitrust mutual assistance agreement, a notice containing—

(A) citations to the locations in the Federal Register at which the text of the antitrust mutual assistance agreement that is so amended, and of any previous amendments to such agreement, are published, and

(B) a description of the manner in which a copy of the antitrust mutual assistance agreement, as so amended, may be obtained from the Attorney General and the Commission.

(d) Condition for validity

An antitrust mutual assistance agreement, or an agreement that makes an amendment to an antitrust mutual assistance agreement, with respect to which publication does not occur in accordance with subsections (a), (b), and (c) of this section shall not be considered to be in effect under this chapter.

15 U.S.C. § 6207 (Section 8 of the IAEAA)

(a) Determinations
Neither the Attorney General nor the Commission may conduct an investigation under section 6202 of this title, apply for an order under section 6203 of this title, or provide antitrust evidence to a foreign antitrust authority under an antitrust mutual assistance agreement, unless the Attorney General or the Commission, as the case may be, determines in the particular instance in which the investigation, application, or antitrust evidence is requested that—

(1) the foreign antitrust authority—

(A) will satisfy the assurances, terms, and conditions described in subparagraphs (A), (B), and (E) of section 6211 (2) of this title, and

(B) is capable of complying with and will comply with the confidentiality requirements applicable under such agreement to the requested antitrust evidence,

(2) providing the requested antitrust evidence will not violate section 6204 of this title, and

(3) conducting such investigation, applying for such order, or providing the requested antitrust evidence, as the case may be, is consistent with the public interest of the United States, taking into consideration, among other factors, whether the foreign state or regional economic integration organization represented by the foreign antitrust authority holds any proprietary interest that could benefit or otherwise be affected by such investigation, by the granting of such order, or by the provision of such antitrust evidence.

(b) Limitation on disclosure of certain antitrust evidence

Neither the Attorney General nor the Commission may disclose in violation of an antitrust mutual assistance agreement any antitrust evidence received under such agreement, except that such agreement may not prevent the disclosure of such antitrust evidence to a defendant in an action or proceeding brought by the Attorney General or the Commission for a violation of any of the Federal laws if such disclosure would otherwise be required by Federal law.

(c) Required disclosure of notice received

If the Attorney General or the Commission receives a notice described in section 6211 (2)(H) of this title, the Attorney General or the Commission, as the case may be, shall transmit such notice to the person that provided the evidence with respect to which such notice is received.

15 U.S.C. § 6208 (Section 9 of the IAEAA)

(a) Determinations

Determinations made under paragraphs (1) and (3) of section 6207 (a) of this title shall not be subject to judicial review.

(b) Citations to and descriptions of confidentiality laws

Whether an antitrust mutual assistance agreement satisfies section 6211 (2)(C) of this title shall not be subject to judicial review.

(c) Rules of construction

(1) Administrative Procedure Act

The requirements in section 6206 of this title with respect to publication and request for public comment shall not be construed to create any availability of judicial review under chapter 7 of title 5.

(2) Laws referenced in section 6204 of this title

Nothing in this section shall be construed to affect the availability of judicial review under laws referred to in section 6204 of this title.

15 U.S.C. § 6209 (Section 10 of the IAEAA)

(a) In general

The authority provided by this chapter is in addition to, and not in lieu of, any other authority vested in the Attorney General, the Commission, or any other officer of the United States.

(b) Attorney General and Commission

This chapter shall not be construed to modify or affect the allocation of responsibility between the Attorney General and the Commission for the enforcement of the Federal antitrust laws.

15 U.S.C. § 6210 (Section 11 of the IAEAA)

In the 30-day period beginning 3 years after November 2, 1994, and with the concurrence of the Commission, the Attorney General shall submit, to the Speaker of the House of Representatives and the President pro tempore of the Senate, a report—

(1) describing how the operation of this chapter has affected the enforcement of the Federal antitrust laws,

(2) describing the extent to which foreign antitrust authorities have complied with the confidentiality requirements applicable under antitrust mutual assistance agreements in effect under this chapter,

(3) specifying separately the identities of the foreign states, regional economic integration organizations, and foreign antitrust authorities that have entered into such agreements and the identities of the foreign antitrust authorities with respect to which such foreign states and such organizations have entered into such agreements,

(4) specifying the identity of each foreign state, and each regional economic integration organization, that has in effect a law similar to this chapter,

(5) giving the approximate number of requests made by the Attorney General and the Commission under such agreements to foreign antitrust authorities for antitrust investigations and for antitrust evidence,

(6) giving the approximate number of requests made by foreign antitrust authorities under such agreements to the Attorney General and the Commission for investigations under section 6202 of this title, for orders under section 6203 of this title, and for antitrust evidence, and

(7) describing any significant problems or concerns of which the Attorney General is aware with respect to the operation of this chapter.

15 U.S.C. § 6211 (Section 12 of the IAEAA)

For purposes of this chapter:

(1) The term "antitrust evidence" means information, testimony, statements, documents, or other things that are obtained in anticipation of, or during the course of, an investigation or proceeding under any of the Federal antitrust laws or any of the foreign antitrust laws.

(2) The term "antitrust mutual assistance agreement" means a written agreement, or written memorandum of understanding, that is entered into by the United States and a foreign state or regional economic integration organization (with respect to the foreign antitrust authorities of such foreign state or such organization, and such other governmental

entities of such foreign state or such organization as the Attorney General and the Commission jointly determine may be necessary in order to provide the assistance described in subparagraph (A)), or jointly by the Attorney General and the Commission and a foreign antitrust authority, for the purpose of conducting investigations under section 6202 of this title, applying for orders under section 6203 of this title, or providing antitrust evidence, on a reciprocal basis and that includes the following:

(A) An assurance that the foreign antitrust authority will provide to the Attorney General and the Commission assistance that is comparable in scope to the assistance the Attorney General and the Commission provide under such agreement or such memorandum.

(B) An assurance that the foreign antitrust authority is subject to laws and procedures that are adequate to maintain securely the confidentiality of antitrust evidence that may be received under section 6201, 6202, or 6203 of this title and will give protection to antitrust evidence received under such section that is not less than the protection provided under the laws of the United States to such antitrust evidence.

(C) Citations to and brief descriptions of the laws of the United States, and the laws of the foreign state or regional economic integration organization represented by the foreign antitrust authority, that protect the confidentiality of antitrust evidence that may be provided under such agreement or such memorandum. Such citations and such descriptions shall include the enforcement mechanisms and penalties applicable under such laws and, with respect to a regional economic integration organization, the applicability of such laws, enforcement mechanisms, and penalties to the foreign states composing such organization.

(D) Citations to the Federal antitrust laws, and the foreign antitrust laws, with respect to which such agreement or such memorandum applies.

(E) Terms and conditions that specifically require using, disclosing, or permitting the use or disclosure of, antitrust evidence received under such agreement or such memorandum only—

  (i) for the purpose of administering or enforcing the foreign antitrust laws involved, or

  (ii) with respect to a specified disclosure or use requested by a foreign antitrust authority and essential to a significant law enforcement objective, in accordance with the prior written consent that the Attorney General or the Commission, as the case may be, gives after—

    (I) determining that such antitrust evidence is not otherwise readily available with respect to such objective,

    (II) making the determinations described in paragraphs (2) and (3) of section 6207 (a) of this title, with respect to such disclosure or use, and

    (III) making the determinations applicable to a foreign antitrust authority under section 6207 (a)(1) of this title (other than the determination regarding the assurance described in subparagraph (A) of this paragraph), with respect to each additional governmental entity, if any, to be provided such antitrust evidence in the course of such disclosure or use, after having received adequate written assurances applicable to each such governmental entity.

(F) An assurance that antitrust evidence received under section 6201, 6202, or 6203 of this title from the Attorney General or the Commission, and all copies of such evidence, in the possession or control of the foreign antitrust authority will be returned to the Attorney General or the Commission, respectively, at the conclusion of the foreign investigation or proceeding with respect to which such evidence was so received.

(G) Terms and conditions that specifically provide that such agreement or such memorandum will be terminated if—

(i) the confidentiality required under such agreement or such memorandum is violated with respect to antitrust evidence, and

(ii) adequate action is not taken both to minimize any harm resulting from the violation and to ensure that the confidentiality required under such agreement or such memorandum is not violated again.

(H) Terms and conditions that specifically provide that if the confidentiality required under such agreement or such memorandum is violated with respect to antitrust evidence, notice of the violation will be given—

(i) by the foreign antitrust authority promptly to the Attorney General or the Commission with respect to antitrust evidence provided by the Attorney General or the Commission, respectively, and

(ii) by the Attorney General or the Commission to the person (if any) that provided such evidence to the Attorney General or the Commission.

(3) The term "Attorney General" means the Attorney General of the United States.

(4) The term "Commission" means the Federal Trade Commission.

(5) The term "Federal antitrust laws" has the meaning given the term "antitrust laws" in subsection (a) of section 12 of this title but also includes section 45 of this title to the extent that such section 45 applies to unfair methods of competition.

(6) The term "foreign antitrust authority" means a governmental entity of a foreign state or of a regional economic integration organization that is vested by such state or such organization with authority to enforce the foreign antitrust laws of such state or such organization.

(7) The term "foreign antitrust laws" means the laws of a foreign state, or of a regional economic integration organization, that are substantially similar to any of the Federal antitrust laws and that prohibit conduct similar to conduct prohibited under the Federal antitrust laws.

(8) The term "person" has the meaning given such term in subsection (a) of section 12 of this title.

(9) The term "regional economic integration organization" means an organization that is constituted by, and composed of, foreign states, and on which such foreign states have conferred sovereign authority to make decisions that are binding on such foreign states, and that are directly applicable to and binding on persons within such foreign states, including the decisions with respect to—

(A) administering or enforcing the foreign antitrust laws of such organization, and

(B) prohibiting and regulating disclosure of information that is obtained by such organization in the course of administering or enforcing such laws.

15 U.S.C. § 6212 (Section 13 of the IAEAA)

The Attorney General and the Commission are authorized to receive from a foreign antitrust authority, or from the foreign state or regional economic integration organization represented by such foreign antitrust authority, reimbursement for the costs incurred by the Attorney General or the Commission, respectively, in conducting an investigation under section 6202 of this title requested by such foreign antitrust authority, applying for an order under section 6203 of this title to assist such foreign antitrust authority, or providing antitrust evidence to such foreign antitrust authority under an antitrust mutual assistance agreement in effect under this chapter with respect to such foreign antitrust authority.

Alternative Fines Statute

18 U.S.C. § 3571

(a) In General.—A defendant who has been found guilty of an offense may be sentenced to pay a fine.

(b) Fines for Individuals.—Except as provided in subsection (e) of this section, an individual who has been found guilty of an offense may be fined not more than the greatest of—

- (1) the amount specified in the law setting forth the offense;
- (2) the applicable amount under subsection (d) of this section;
- (3) for a felony, not more than $250,000;
- (4) for a misdemeanor resulting in death, not more than $250,000;
- (5) for a Class A misdemeanor that does not result in death, not more than $100,000;
- (6) for a Class B or C misdemeanor that does not result in death, not more than $5,000; or
- (7) for an infraction, not more than $5,000.

(c) Fines for Organizations.—Except as provided in subsection (e) of this section, an organization that has been found guilty of an offense may be fined not more than the greatest of—

- (1) the amount specified in the law setting forth the offense;
- (2) the applicable amount under subsection (d) of this section;
- (3) for a felony, not more than $500,000;
- (4) for a misdemeanor resulting in death, not more than $500,000;
- (5) for a Class A misdemeanor that does not result in death, not more than $200,000;
- (6) for a Class B or C misdemeanor that does not result in death, not more than $10,000; and
- (7) for an infraction, not more than $10,000.

(d) Alternative Fine Based on Gain or Loss.—If any person derives pecuniary gain from the offense, or if the offense results in pecuniary loss to a person other than the defendant, the defendant may be fined not more than the greater of twice the gross gain or twice the gross loss, unless imposition of a fine under this subsection would unduly complicate or prolong the sentencing process.

(e) Special Rule for Lower Fine Specified in Substantive Provision.—If a law setting forth an offense specifies no fine or a fine that is lower than the fine otherwise applicable under this section and such law, by specific reference, exempts the offense from the applicability of the fine otherwise applicable under this section, the defendant may not be fined more than the amount specified in the law setting forth the offense.

Antitrust Criminal Penalty Enhancement and Reform Act of 2004, Subtitle A

15 U.S.C. § 1 note (Section 211 of the ACPERA)

(a) In General.—Except as provided in subsection (b), the provisions of sections 211 through 214 shall cease to have effect 5 years after the date of enactment of this Act.

(b) Exception.—With respect to an applicant who has entered into an antitrust leniency agreement on or before the date on which the provisions of sections 211 through 214 of this subtitle shall cease to have effect, the provisions of sections 211 through 214 of this subtitle shall continue in effect.

15 U.S.C. § 1 note (Section 212 of the ACPERA)

In this subtitle:

(1) Antitrust division.—The term “Antitrust Division” means the United States Department of Justice Antitrust Division.

(2) Antitrust leniency agreement.—The term “antitrust leniency agreement,” or “agreement,” means a leniency letter agreement, whether conditional or final, between a person and the Antitrust Division pursuant to the Corporate Leniency Policy of the Antitrust Division in effect on the date of execution of the agreement.

(3) Antitrust leniency applicant.—The term “antitrust leniency applicant,” or “applicant,” means, with respect to an antitrust leniency agreement, the person that has entered into the agreement.

(4) Claimant.—The term “claimant” means a person or class, that has brought, or on whose behalf has been brought, a civil action alleging a violation of section 1 or 3 of the Sherman Act or any similar State law, except that the term does not include a State or a subdivision of a State with respect to a civil action brought to recover damages sustained by the State or subdivision.

(5) Cooperating individual.—The term “cooperating individual” means, with respect to an antitrust leniency agreement, a current or former director, officer, or employee of the antitrust leniency applicant who is covered by the agreement.

(6) Person.—The term “person” has the meaning given it in subsection (a) of the first section of the Clayton Act.

15 U.S.C. § 1 note (Section 213 of the ACPERA)

(a) In General.—Subject to subsection (d), in any civil action alleging a violation of section 1 or 3 of the Sherman Act, or alleging a violation of any similar State law, based on conduct covered by a currently effective antitrust leniency agreement, the amount of damages recovered by or on behalf of a claimant from an antitrust leniency applicant who satisfies the requirements of subsection (b), together with the amounts so recovered from cooperating individuals who satisfy such requirements, shall not exceed that portion of the actual damages sustained by such claimant which is attributable to the commerce done by the applicant in the goods or services affected by the violation.

(b) Requirements.—Subject to subsection (c), an antitrust leniency applicant or cooperating individual satisfies the requirements of this subsection with respect to a civil action described in subsection (a) if the court in which the civil action is brought determines, after considering any appropriate pleadings from the claimant, that the applicant or cooperating individual, as the case may be, has provided satisfactory cooperation to the claimant with respect to the civil action, which cooperation shall include—

  (1) providing a full account to the claimant of all facts known to the applicant or cooperating individual, as the case may be, that are potentially relevant to the civil action;

  (2) furnishing all documents or other items potentially relevant to the civil action that are in the possession, custody, or control of the applicant or cooperating individual, as the case may be, wherever they are located; and

  (3)

    (A) in the case of a cooperating individual—

      (i) making himself or herself available for such interviews, depositions, or testimony in connection with the civil action as the claimant may reasonably require; and

      (ii) responding completely and truthfully, without making any attempt either falsely to protect or falsely to implicate any person or entity, and without intentionally withholding any potentially relevant information, to all questions asked by the claimant in interviews, depositions, trials, or any other court proceedings in connection with the civil action; or

    (B) in the case of an antitrust leniency applicant, using its best efforts to secure and facilitate from cooperating individuals covered by the agreement the cooperation described in clauses (i) and (ii) and subparagraph (A).

(c) Timeliness.—If the initial contact by the antitrust leniency applicant with the Antitrust Division regarding conduct covered by the antitrust leniency agreement occurs after a State, or subdivision of a State, has issued compulsory process in connection with an investigation of allegations of a violation of section 1 or 3 of the Sherman Act or any similar State law based on conduct covered by the antitrust leniency agreement or after a civil action described in subsection (a) has been filed, then the court shall consider, in making the determination concerning satisfactory cooperation described in subsection (b), the timeliness of the applicant's initial cooperation with the claimant.

(d) Continuation.—Nothing in this section shall be construed to modify, impair, or supersede the provisions of sections 4, 4A, and 4C of the Clayton Act relating to the recovery of costs of suit, including a reasonable attorney's fee, and interest on damages, to the extent that such recovery is authorized by such sections.

15 U.S.C. § 1 note (Section 214 of the ACPERA)

Nothing in this subtitle shall be construed to—

(1) affect the rights of the Antitrust Division to seek a stay or protective order in a civil action based on conduct covered by an antitrust leniency agreement to prevent the cooperation described in section 213(b) from impairing or impeding the investigation or prosecution by the Antitrust Division of conduct covered by the agreement;

(2) create any right to challenge any decision by the Antitrust Division with respect to an antitrust leniency agreement; or

(3) affect, in any way, the joint and several liability of any party to a civil action described in section 213(a), other than that of the antitrust leniency applicant and cooperating individuals as provided in section 213(a) of this title.

amending 15 U.S.C. § 1 (Section 215 of the ACPERA)

(a) Restraint of Trade Among the States.—Section 1 of the Sherman Act (15 U.S.C. 1) is amended by—

  (1) striking "$10,000,000"' and inserting "$100,000,000";

  (2) striking "$350,000" and inserting "$1,000,000"; and

  (3) striking "three" and inserting "10."

(b) Monopolizing Trade.—Section 2 of the Sherman Act (15 U.S.C. 2) is amended by—

  (1) striking "$10,000,000" and inserting "$100,000,000";

  (2) striking "$350,000" and inserting "$1,000,000"; and

  (3) striking "three" and inserting "10."

(c) Other Restraints of Trade.—Section 3 of the Sherman Act (15 U.S.C. 3) is amended by—

  (1) striking "$10,000,000" and inserting "$100,000,000";

  (2) striking "$350,000" and inserting "$1,000,000"; and

  (3) striking "three" and inserting "10."

Appendix B
Antitrust Modernization Commission Hearings

By Hearing Topic

Merger Enforcement (November 17, 2005)

Panel I—Assessment of U.S. Merger Enforcement Policy

William Baer, Arnold & Porter LLP, Washington, D.C.

James F. Rill, Howrey LLP, Washington, D.C.

David T. Scheffman, LECG, LLC, Washington, D.C.

Prof. Robert D. Willig, Competition Policy Associates (COMPASS), Princeton, New Jersey

Panel II—Treatment of Efficiencies in Merger Enforcement

Prof. Jonathan Baker, Washington College of Law, American University, Washington, D.C.

George S. Cary, Cleary Gottlieb Steen & Hamilton LLP, Washington, D.C.

Kenneth Heyer, U.S. Department of Justice, Antitrust Division, Washington, D.C.

Charles F. (Rick) Rule, Fried, Frank, Harris, Shriver & Jacobson, Washington, D.C.

Michael Salinger, Federal Trade Commission, Bureau of Economics, Washington, D.C.

Panel III—Hart-Scott-Rodino Second Request Process

Wayne Dale Collins, Shearman & Sterling LLP, New York, New York & Washington, D.C.

Susan A. Creighton, Federal Trade Commission, Washington, D.C.

J. Robert Kramer, II, U.S. Department of Justice, Antitrust Division, Washington, D.C.

David P. Wales, Jr., Cadwalader, Wickersham & Taft, LLP, Washington, D.C.

Mark D. Whitener, General Electric Company, Washington, D.C.

Economists' Roundtable on Merger Enforcement (January 19, 2006)

Prof. Timothy F. Bresnahan, Stanford University, Stanford, California

Prof. Steven Neil Kaplan, University of Chicago Graduate School of Business, Chicago, Illinois

Prof. Peter C. Reiss, Graduate School of Business, Stanford University, Stanford, California

Prof. Daniel L. Rubinfeld, Boalt Hall School of Law, University of California at Berkeley, Berkeley, California

Prof. Lawrence J. White, Leonard N. Stern School of Business, New York University, New York, New York

Exclusionary Conduct (September 29, 2005)

Kenneth L. Glazer, Coca-Cola Co., Atlanta, Georgia

Prof. Timothy J. Muris, O'Melveny & Myers LLP, Washington, D.C.

R. Hewitt Pate, Hunton & Williams LLP, Washington, D.C.

Prof. Robert Pitofsky, Georgetown University Law Center, Washington, D.C.

M. Laurence Popofsky, Heller Ehrman LLP, San Francisco, California

Charles F. (Rick) Rule, Fried, Frank, Harris, Shriver & Jacobson LLP, Washington, D.C.

Prof. Steven C. Salop, Georgetown University Law Center, Washington, D.C.

Prof. Carl Shapiro, Haas School of Business, University of California at Berkeley, Berkeley, California

Willard K. Tom, Morgan, Lewis & Bockius LLP, Washington, D.C.

New Economy (November 8, 2005)

Panel I—Antitrust and the New Economy

Daniel Cooperman, Oracle Corporation, Redwood Shores, California

Prof. Richard J. Gilbert, University of California at Berkeley, Berkeley, California

M. Howard Morse, Drinker Biddle & Reath LLP, Washington, D.C.

James J. O'Connell, Jr., U.S. Department of Justice, Antitrust Division, Washington, D.C.

John E. Osborn, Cephalon, Inc., Frazer, Pennsylvania

Prof. Carl Shapiro, Haas School of Business, University of California at Berkeley, Berkeley, California

Panel II—Patent Law Reform

Susan DeSanti, Federal Trade Commission, Washington, D.C.

Peter Detkin, Intellectual Ventures, Bellevue, Washington

Prof. Mark A. Lemley, Stanford Law School, Stanford, California

Stephen A. Merrill, National Academies' Board on Science, Technology and Economic Policy (STEP), Washington, D.C.

Stephen M. Pinkos, United States Patent and Trademark Office, Alexandria, Virginia

Stephen A. Stack, Jr., Dechert LLP, Philadelphia, Pennsylvania

Federal Enforcement Institutions (November 3, 2005)

Panel I—Harmonizing FTC and DOJ Injunction Procedures

William Blumenthal, Federal Trade Commission, Washington, D.C.

Craig Conrath, U.S. Department of Justice, Antitrust Division, Washington, D.C.

Joe Sims, Jones Day, Washington, D.C.

Michael N. Sohn, Arnold & Porter LLP, Washington, D.C.

Panel II—The FTC-DOJ Clearance Process

Prof. Timothy J. Muris, O'Melveny & Myers LLP, Washington, D.C.

John M. Nannes, Skadden, Arps, Slate, Meagher & Flom LLP, Washington, D.C.

Joe Sims, Jones Day, Washington, D.C.

Michael N. Sohn, Arnold & Porter LLP, Washington, D.C.

State Enforcement Institutions (October 26, 2005)

Prof. Michael E. DeBow, Cumberland School of Law, Samford University, Birmingham, Alabama

Prof. Harry First, New York University School of Law, New York, New York

Phillip A. Proger, Jones Day, Washington, D.C.

Hon. G. Steven Rowe, Attorney General, State of Maine, Augusta, Maine

International Antitrust (February 15, 2006)

James R. Atwood, Covington & Burling, San Francisco, California

Michael D. Blechman, Kaye Scholer LLP, New York, New York

Prof. Eleanor M. Fox, New York University School of Law, New York, New York

Gerald F. Masoudi, U.S. Department of Justice, Washington, D.C.

Randolph W. Tritell, Federal Trade Commission, Washington, D.C.

Civil Remedies (July 28, 2005)

Panel I—Damages Multiplier, Attorneys' Fees, and Prejudgment Interest

David Boies, Boies, Schiller & Flexner LLP, Armonk, New York

Prof. Edward Cavanagh, St. John's University School of Law, Jamaica, New York

Prof. Robert H. Lande, University of Baltimore School of Law, Baltimore, Maryland

Abbott (Tad) B. Lipsky, Latham & Watkins LLP, Washington, D.C.

Stephen D. Susman, Susman Godfrey LLP, Houston, Texas

Panel II—Joint & Several Liability, Contribution, and Claim Reduction

Lloyd Constantine, Constantine Cannon, PC, New York, New York

Hon. Frank H. Easterbrook, United States Court of Appeals for the Seventh Circuit, Chicago, Illinois

Michael D. Hausfeld, Cohen, Milstein, Hausfeld & Toll, PLLC, Washington, D.C.

Don T. Hibner, Jr., Sheppard, Mullin, Richter & Hampton LLP, Los Angeles, California

Harry M. Reasoner, Vinson & Elkins L.L.P., Houston, Texas

Indirect Purchaser Litigation (June 27, 2005)

Hon. Mark J. Bennett, Attorney General, State of Hawaii, Honolulu, Hawaii
Ellen Cooper, Maryland Attorney General's Office, Antitrust Division, Baltimore, Maryland

Biographies

COMMISSIONERS

Deborah A. Garza, *Chair*

Deborah Garza is a partner in Fried, Frank, Harris, Shriver & Jacobson LLP's Washington, D.C., office. Previously, Ms. Garza was a partner at Covington & Burling, where she was an attorney from 1989 to 2001. Prior to that, she served in the Antitrust Division of the Department of Justice as Chief of Staff and Counselor, from 1988 to 1989, and as Special Assistant to the Assistant Attorney General for Antitrust from 1984 to 1985. Ms. Garza received her J.D. from the University of Chicago Law School in 1981. She received her B.S. from Northern Illinois University in 1978.

Jonathan R. Yarowsky, *Vice-Chair*

Jonathan Yarowsky is a partner in Patton Boggs LLP's Washington, D.C., office. Previously, Mr. Yarowsky served in a number of government positions. Most recently, he was Special Associate Counsel to President Clinton, responsible for advising the President on antitrust, telecommunications, and other matters, including judicial selection for the federal judiciary. Prior to that, he served for five years as General Counsel to the House Committee on the Judiciary, where he had supervisory responsibility for numerous subject matter areas. Mr. Yarowsky also served as Chief Counsel to the House Judiciary Subcommittee on Economic and Commercial Law, prior to assuming the position of General Counsel for the Full Committee. Mr. Yarowsky received his J.D. from U.C.L.A. Law School in 1977 and his A.B. from the University of Michigan in 1971. Mr. Yarowsky also holds an M.S. from Cornell University, which he received in 1974.

Bobby R. Burchfield, *Commissioner*

Bobby Burchfield is a partner at McDermott, Will & Emery in Washington, D.C., where he is co-partner-in-charge of the Washington office and Chair of the Complex Litigation Practice. Before joining McDermott in 2004, Burchfield was at Covington & Burling, where he was a partner since 1987 and the Co-Chair of the Litigation Umbrella Group. He previously served as General Counsel to the campaign of President George H.W. Bush in 1992. Mr. Burchfield received his J.D. from the George Washington University Law School in 1979 and his B.A. from the Wake Forest University in 1976.

W. Stephen Cannon, *Commissioner*

Steve Cannon is Chairman of Constantine Cannon, LLP. Prior to joining the firm in 2005, Mr. Cannon was Senior Vice President, General Counsel, and Secretary of Circuit City Stores, Inc., in Richmond, Virginia. Before joining Circuit City in 1994, Mr. Cannon had been a partner at Wunder, Diefenderfer, Cannon & Thelen, in Washington, D.C. Previously, he served as a Deputy Assistant Attorney General in the Antitrust Division of the United States Department of Justice. Before that, Mr. Cannon served as Chief Antitrust Counsel to the Committee on the Judiciary of the Senate and as a trial attorney in the Antitrust Division. Mr. Cannon received his J.D. from the University of South Carolina Law School in 1976 and his B.A. from the University of South Carolina in 1973.

Dennis W. Carlton, *Commissioner*

Dennis Carlton is the Deputy Assistant Attorney General for Economic Analysis at the U.S. Department of Justice. Mr. Carlton is a professor of economics at the University of Chicago Graduate School of Business (currently on leave), a position that he has held since 1984. Previously, Mr. Carlton was a faculty member at the University of Chicago Law School and the department of economics. Prior to his appointment to the Department of Justice in October 2006, Mr. Carlton was also a Senior Managing Director of Lexecon, an economic consulting firm. Mr. Carlton's principal areas of study are industrial organization and theoretical and applied microeconomics. Mr. Carlton has served as the co-editor of the *Journal of Law and Economics* since 1980. Mr. Carlton was awarded his Ph.D. in Economics from the Massachusetts Institute of Technology in 1975, which also awarded him an M.S. in Operations Research in 1974. Mr. Carlton received his A.B. from Harvard College in 1972.

Makan Delrahim, *Commissioner*

Makan Delrahim is a partner at Brownstein Hyatt Farber Schreck, which he joined in 2005. Previously, he had been the Deputy Assistant Attorney General for International, Policy, and Appellate Matters in the Antitrust Division of the Department of Justice, a position he assumed in 2003. Before that, Mr. Delrahim was Chief Counsel and Staff Director to the Judiciary Committee of the Senate. From 1996 to 1998, he was an attorney at Patton Boggs LLP, in Washington, D.C. Mr. Delrahim received his J.D. from George Washington University Law School in 1996, and a B.S. from the University of California at Los Angeles in 1991. He was also awarded an M.S. in Biotechnology by Johns Hopkins University in 2001.

Jonathan M. Jacobson, *Commissioner*

Jonathan Jacobson is a partner at Wilson Sonsini Goodrich & Rosati in New York City. From 1993 through 2005, he was a partner at Akin, Gump, Strauss, Hauer & Feld LLP, where he was the co-chair of the firm's antitrust practice. He is the editorial chair of the Antitrust Section's sixth edition of *Antitrust Law Developments*, published in 2007 by the Antitrust Section of the American Bar Association, and previously served as co-chair of the Books and Treatises Committee of the Antitrust Section. Mr. Jacobson received his J.D. from Brooklyn Law School in 1976. He received his A.B. from Columbia College in 1973.

Donald G. Kempf, Jr., *Commissioner*

Donald Kempf is an AAA- and CPR-certified arbitrator and mediator, an adjunct professor of law, and a sole practitioner. He retired in 2005 from Morgan Stanley, where he was Executive Vice President, Chief Legal Officer, Secretary, and a member of the company's Management Committee. Before joining Morgan Stanley in 1999, Mr. Kempf was a partner at Kirkland & Ellis, where he had been a trial lawyer since his graduation from law school. Mr. Kempf received his LL.B. from Harvard Law School in 1965, and an A.B. from Villanova University in 1959. He also received an M.B.A. from the University of Chicago Graduate School of Business in 1989.

Sanford M. Litvack, *Commissioner*

Sanford Litvack is a partner in Hogan & Hartson LLP's New York and Los Angeles offices. He joined the firm in 2004, having previously been a partner at Quinn, Emanuel, Urquhart Oliver & Hedges LLP. Mr. Litvack has held several other positions, including recently as Senior Executive Vice President and Chief of Corporate Operations for The Walt Disney Company, where he also served briefly as Vice Chairman of the Board of Directors. Previously, he served as Assistant Attorney General in the Antitrust Division of the Department of Justice from 1979 to 1981. He received his LL.B. in 1959 from Georgetown University and a B.A. from the University of Connecticut in 1956.

John H. Shenefield, *Commissioner*

John Shenefield has been a partner at Morgan Lewis, in the firm's Washington, D.C., office, since 1986. Prior to joining Morgan Lewis, Mr. Shenefield was the Assistant Attorney General for the Antitrust Division of the Department of Justice from 1977 to 1979. He subsequently served as Associate Attorney General from 1979 to 1981. While at the Department of Justice, Mr. Shenefield served as the Chairman of the National Commission to Review Antitrust Laws and Procedures, which issued its report in 1979. He received his LL.B. from Harvard Law School in 1965 and an A.B. from Harvard College in 1960.

Debra A. Valentine, *Commissioner*

Debra Valentine is Vice President, Deputy General Counsel, and Secretary for United Technologies Corporation, headquartered in Hartford, Connecticut. She joined UTC in January 2004. Previously, Ms. Valentine had been a partner at O'Melveny & Myers LLP, in the firm's Washington, D.C., office, where she was an attorney for thirteen years. She interrupted her practice at O'Melveny & Myers to serve in several leadership positions at the Federal Trade Commission, including General Counsel, from 1995 to 2001. Ms. Valentine also was an attorney in the Office of Legal Counsel at the Department of Justice from 1981 to 1985. Ms. Valentine received her J.D. from Yale Law School in 1980. She received an A.B. from Princeton University in 1976.

John L. Warden, *Commissioner*

John Warden is a partner in the New York office of Sullivan & Cromwell LLP, where he has practiced since his graduation from law school. Mr. Warden received his LL.B. from the University of Virginia Law School in 1965. He received his A.B. from Harvard University in 1962. He is a fellow of the American College of Trial Lawyers and a member of the American Law Institute.

COMMISSION STAFF

Andrew J. Heimert, *Executive Director & General Counsel*

Andrew J. Heimert previously was an attorney in the Federal Trade Commission's Office of Policy and Coordination, where he worked on a variety of antitrust policy issues. Prior to that, Mr. Heimert was an attorney at Covington & Burling, from 1997 to 2001, where he practiced antitrust and litigation. Immediately following law school, Mr. Heimert clerked for Richard S. Arnold, Chief Judge for the United States Court of Appeals for the Eighth Circuit. Mr. Heimert received his J.D. from Yale Law School in 1996. He received his A.B. from Stanford University in 1993.

Susan S. DeSanti, *Senior Counsel*

Susan S. DeSanti was previously the Deputy General Counsel for Policy Studies at the Federal Trade Commission, a position she had held since 2001. From 1995 to 2001, Ms. DeSanti was the Director of the Office of Policy Planning. In those positions, she had responsibility for several FTC reports. She held several other positions at the FTC between 1991 and 1995. Before joining the Federal Trade Commission, Ms. DeSanti was a partner at Hogan & Hartson. She received a J.D. from Boston University School of Law, and a B.A. from Sarah Lawrence College.

William F. Adkinson, Jr., *Counsel*

William F. Adkinson, Jr. was previously an attorney in the antitrust group at Wilmer, Cutler & Pickering in Washington, D.C., where his practice covered a wide range of merger, counseling, and litigation matters. Mr. Adkinson served as Senior Policy Counsel at The Progress & Freedom Foundation directly before joining the Commission staff, where he addressed a variety of competition and regulatory issues. He is currently a Senior Editor of the Antitrust Law Journal and previously served as President of the National Economists Club. Mr. Adkinson graduated from Amherst College in 1978. He received his law degree from Yale Law School in 1987, where he also completed oral examinations in Industrial Organization and Public Finance in the Economics Department's Ph.D. program.

Nadine Jones, *Counsel*

Nadine Jones was an antitrust associate at Arnold & Porter LLP prior to joining the Commission. Her practice included a $41 billion telecommunications merger in 2004, complex antitrust litigation involving the financial industry, and other matters involving both civil and criminal antitrust liability. Ms. Jones is a 2003 graduate of Howard University School of Law. While at Howard, she served as an Articles Editor for the Howard Law Journal, and as a research assistant for Professor Andrew I. Gavil.

Marni B. Karlin, *Counsel*

Marni B. Karlin was previously an antitrust associate at Axinn, Veltrop & Harkrider LLP, where her practice included a $41 billion telecommunications merger in 2004 and complex antitrust litigation. Prior to that, Ms. Karlin was an associate in the antitrust and litigation groups at O'Melveny & Myers LLP. Immediately following law school, Ms. Karlin clerked for John M. Duhé, Jr., Judge on the United States Court of Appeals for the Fifth Circuit. Ms. Karlin received her J.D. from the University of Chicago Law School in 2001. She received her B.A. from George Washington University in 1998.

Hiram R. Andrews, *Law Clerk*

Hiram Andrews is currently attending Georgetown University Law Center's Evening Division. Mr. Andrews received his M.A. in German Literature from Yale University in 2000 and his A.B. from Bowdoin College in 1997. Mr. Andrews previously worked as a paralegal at the Federal Trade Commission's Bureau of Competition, and also served as a Fulbright Teaching Assistant in Austria.

Christopher N. Bryan, *Paralegal*

Christopher Bryan was previously an administrative assistant in the General Counsel's office at the Federal Trade Commission. Mr. Bryan received his B.A. in Political Science from the University of California at Santa Barbara in 2005.

Kristen M. Gorzelany, *Paralegal*

Kristen Gorzelany received a B.A. from Hamilton College in 2001, where she also worked as a writing tutor. Previously, Ms. Gorzelany was a paralegal at the Federal Trade Commission's Bureau of Competition. She also worked as a paralegal for two attorneys in private practice in northern California.

Sylvia Boone, *Administrative Officer*

Sylvia Boone was previously the administrative officer for the U.S. Commission on Ocean Policy. Before that, Ms. Boone worked for the Millennial Housing Commission and several other federal agencies.

Alan J. Meese, *Senior Advisor*

Alan Meese is the Ball Professor of Law at William and Mary, where he has taught since 1995. Meese received his A.B. from William and Mary and his J.D. from the University of Chicago Law School. After law school Professor Meese served as a law clerk, first to Judge Frank Easterbrook and then to Justice Antonin Scalia. He then practiced law at Skadden, Arps, Slate, Meagher & Flom in Washington, D.C., before joining the faculty at William and Mary.

Michael W. Klass, *Economics Advisor*

Michael W. Klass is an economist at the Antitrust Division of the Department of Justice, which he joined in 1998. Before joining the Division he worked for years as a consultant on antitrust, trade, and other issues. From 1977 to 1980, Mr. Klass directed antitrust economics at the Federal Trade Commission. Before that, he was Staff Economist for Regulatory Reform, for the Senate Governmental Affairs Committee, where he co-wrote a major study of regulatory reform. Mr. Klass received his Ph.D. in economics from the University of Wisconsin in 1970 and his B.A from Carleton College in 1965. Mr. Klass also received a Certificate from Harvard's Program for Senior Managers in Government in 1979.

Circular No. A-4

November 9, 2023

TO THE HEADS OF EXECUTIVE AGENCIES AND ESTABLISHMENTS

Subject: **Regulatory Analysis**

Circular No. A-4 provides the Office of Management and Budget's (OMB's) guidance to Federal agencies on the development of regulatory analysis as required under Section 6(a)(3)(C) of Executive Order 12866 of September 30, 1993 (Regulatory Planning and Review), as amended; the Regulatory Right-to-Know Act, Pub. L. 106–554, § 624, 114 Stat. 2763, 2763A–161 (2000) (codified as amended at 31 U.S.C. 1105 note); and a variety of related authorities. The Circular also provides guidance to agencies on the regulatory accounting statements that are required under the Regulatory Right-to-Know Act.

This Circular supersedes and rescinds the previous version of OMB Circular No. A-4, issued on September 17, 2003.

This update to Circular No. A-4 was subject to interagency review, public comment, and peer review. OMB is grateful for feedback from interagency reviewers, public commenters, and peer reviewers. OMB itself is solely responsible for the content of this Circular.

1. Introduction

This Circular is designed to assist analysts in regulatory agencies by providing guidance on conducting high-quality and evidence-based regulatory analysis—referred to as either "regulatory analysis" or "analysis" in this Circular for brevity—and standardizing the way benefits and costs of Federal regulatory actions are measured and reported. Executive Order 12866 of September 30, 1993 (Regulatory Planning and Review) requires agencies to conduct a regulatory analysis for regulatory actions that are significant as defined by Section 3(f)(1) of that Executive Order, as amended, and more generally to assess the benefits and costs of other significant actions.[1] These requirements apply to regulatory actions that rescind or modify existing regulations, as well as to new regulatory actions, and apply to the extent consistent with applicable law. This Circular is intended to aid agencies in their analysis of the benefits and costs of regulations, when such analysis is required, and when agencies undertake such analysis as a matter of discretion.

Analysts may find it useful to consult additional supporting information relevant to the materials in this Circular, contemporaneously published in a separate document by OMB, entitled *OMB Circular No. A-4: Explanation and Response to Public Input*.[2]

a. The Need for Analysis of Regulatory Actions

Regulatory analysis is a tool that regulatory agencies use to anticipate and evaluate the likely consequences of their regulatory actions. It provides a formal way of organizing the evidence on the key effects of the various alternatives that should be considered in developing regulations. A high-quality regulatory analysis is designed to inform policymakers, other government stakeholders, and the public about the effects of alternative actions. Regulatory analysis can help agencies in developing regulations by clarifying the likely effects of a regulation under consideration, and it is meant to inform the public about the anticipated consequences of government action (and alternatives).

Benefit-cost analysis is the primary analytical tool used for regulatory analysis. As stated in Section 1(a) of Executive Order 12866, "The Regulatory Philosophy":

> Costs and benefits shall be understood to include both quantifiable measures (to the fullest extent that these can be usefully estimated) and qualitative measures of costs and benefits that are difficult to quantify, but nevertheless essential to consider. Further, in choosing among alternative regulatory approaches, agencies should select those approaches that maximize net benefits (including potential economic, environmental, public health and safety, and other advantages; distributive impacts; and equity), unless a statute requires another regulatory approach.

---

[1] Exec. Order No. 12866 of September 30, 1993, 58 Fed. Reg. 51,735 (Oct. 4, 1993). This requirement is reiterated and elaborated upon in Executive Order 13563 of January 18, 2011 (Improving Regulation and Regulatory Review), 76 Fed. Reg. 3821 (Jan. 21, 2011) and Executive Order 14094 of April 6, 2023 (Modernizing Regulatory Review), 88 Fed. Reg. 21,879 (Apr. 11, 2023).

[2] Office of Management & Budget, *OMB Circular No. A-4: Explanation and Response to Public Input* (Nov. 9, 2023), https://www.whitehouse.gov/wp-content/uploads/2023/11/CircularA-4Explanation.pdf.

Section 1(b) of Executive Order 12866, "The Principles of Regulation," states that, to the extent permitted by law and where applicable, agencies "shall assess both the costs and the benefits of the intended regulation and, recognizing that some costs and benefits are difficult to quantify, propose or adopt a regulation only upon a reasoned determination that the benefits of the intended regulation justify its costs."

Benefit-cost analysis of a regulation and alternative regulatory approaches provides policymakers and the public with information about the important advantages and disadvantages of different courses of action. When all benefits and costs (including distributional impacts) can be quantified and expressed in monetary units, regulatory alternatives' monetized net benefits—the difference between the monetized benefits and the monetized costs—are an indication of the alternative, from the set of analyzed alternatives, that generates the largest welfare improvement to society. In practice, it is often difficult to quantify and express all of the important effects of a regulation in monetary units. When it is not possible to monetize all of the important benefits and costs, the alternative with the greatest monetized net benefits will not necessarily be the alternative that generates the greatest social welfare. It follows that, while monetized net benefits are an important guide for agencies deciding what course of action to pursue, regulatory analyses should encompass additional relevant factors; in particular, analyses should include any important non-monetized and unquantified effects. You should consider, as discussed below, how to be as specific as possible in presenting such non-monetized and unquantified effects.

Regulatory analysis, as described in this Circular, does not supplant any analytic or other requirements set out in the statutes that authorize or require agency action, though when appropriate, the regulatory analysis guided by this Circular may inform or be combined with other analytic requirements. The section "*Specialized Analytical Requirements*" discusses analytic requirements that may be relevant.

b. Developing a Regulatory Analysis

In general, key elements of a regulatory analysis include:

- identifying and evaluating the need for the regulatory action;
- defining the baseline;
- identifying a range of regulatory alternatives;
- assessing the benefits and costs of regulatory alternatives by:
    - gathering evidence relevant to the effects of the various alternatives;
    - quantitatively estimating or qualitatively describing the benefits and costs of each regulatory alternative; and
- summarizing the regulatory analysis.

There are detailed descriptions of each of these elements in the subsequent sections of this Circular (see the *Table of Contents* above for a list of sections). As you produce the elements of a regulatory analysis, you may gain additional insight that prompts refinement of previous work. These elements may be iterative, and some elements of the analysis should be repeated as you gain a deeper understanding of the relevant issues.

You will find that you cannot conduct a good regulatory analysis according to a formula. Conducting high-quality analysis requires competent professional judgment. Different regulations may call for different emphases in the analysis, depending on the nature and complexity of the regulatory issues and the sensitivity of the benefit and cost estimates to the key modeling choices. A regulatory analysis should, all else equal, aim for specificity in identifying how the state of the world in the regulation's presence would differ from the state of the world in its absence. When there are data or methodology challenges, less-specific inputs—such as qualitative accounts or numerical ranges—are sometimes used; however, even when a relatively general approach was the best available in the past, it is appropriate to reconsider whether greater specificity could, given scientific advances, be practicable in the regulatory analysis currently being conducted. For example, it might be possible to quantify some effects that could not be quantified a decade earlier, and it might be possible to monetize some effects that could not be monetized a decade earlier.

You should aim for transparency about the key methods, data, and other analytical choices you make in your analysis.

As you design, execute, and write your regulatory analysis, you should, when feasible and appropriate, seek out the opinions of those who will be affected by the regulation as well as the views of those individuals and organizations who may not be affected but have special knowledge or insight into the regulatory issues.[3] For example, to better characterize a regulation's dignity, equity, or fairness effects, you should consider soliciting the perspectives of individuals likely to be affected by the regulation, drawing from their own experiences, on how the regulation may enhance or diminish dignity, equity, or fairness. Consultation can also be useful in ensuring that your analysis addresses all of the relevant issues and that you have access to all pertinent data. Early consultation can be especially helpful. You should not limit consultation to the final stages of your analytical efforts.

2. Analytical Approaches

Both benefit-cost analysis (BCA) and cost-effectiveness analysis (CEA) provide a systematic framework for identifying and evaluating the likely outcomes of alternative regulatory choices. When a regulatory analysis is required by Executive Order 12866, a BCA is generally the more informative of the two types of analysis, because it is a better way of capturing the effects of regulations on social welfare.

a. Benefit-Cost Analysis

A distinctive feature of BCA is that both benefits and costs are expressed in monetary units to the extent feasible, which allows you to evaluate different regulatory options with a variety of attributes using a common measure. By measuring incremental benefits and costs of successively more stringent regulatory alternatives, you can identify the alternative that maximizes net benefits.

---

[3] Such consultations may be subject to the Paperwork Reduction Act of 1995, 44 U.S.C. 3501–3520, among other statutes.

The size of net benefits is the absolute difference between the projected benefits and costs. The ratio of benefits to costs is not a meaningful indicator of net benefits and should not be used for that purpose. Considering such ratios alone can yield misleading results, as such ratios do not clarify which alternative yields the greatest net benefits, and are sensitive to whether negative willingness to pay (WTP) or willingness to accept (WTA) valuations are subtracted from benefits or added to costs.[4]

When a benefit or cost cannot be expressed in monetary units, it is often informative to measure it in terms of physical or other quantitative units that may indicate the direction of welfare change. If it is not possible to estimate quantitatively, you should describe the benefit or cost qualitatively using the best methods available. For guidance on describing qualitative information, see the section "*Assessing Benefits and Costs*."

When important benefits and costs cannot be expressed in monetary units, relying on the monetized net benefits alone will be less useful, and can even be misleading, because the calculation of net benefits in such cases does not provide a full evaluation of all relevant benefits and costs. In other words, a materially incomplete monetized BCA does not offer an adequate summary of the effects on social welfare or of the evidence intended to inform determination of the most net-beneficial alternative.

You should exercise professional judgment in identifying the importance of unquantified factors and assess, as best you can, how they might change the ranking of alternatives based on estimated net benefits. This discussion should also include a clear explanation that supports your determination that these unquantified factors are important. In this case, you may also consider conducting a threshold analysis to help decision makers and other users of the analysis to understand the potential significance of these factors to the overall analysis. For additional discussion, see the section "*Methods for Treating Non-Monetized Benefits and Costs*."

b. Cost-Effectiveness Analysis[5]

Cost-effectiveness analysis can provide a rigorous way to identify options that achieve the most effective use of a given amount of resources, without requiring monetization of all relevant benefits or costs. Generally, cost-effectiveness analysis is designed to compare a set of regulatory actions with the same primary outcome or multiple outcomes that can be integrated into a single meaningful numerical index (*e.g.*, units of health improvement).

A cost-effectiveness ratio is calculated by dividing a numerator of cost by a denominator of units of some effectiveness or performance measure to arrive at cost per unit of effectiveness or performance. The value of CEA is enhanced when there is consistency in the ratio across a diverse set of possible regulatory actions. To achieve consistency, you need to have the same two key components of any CEA: (1) the cost, and (2) the effectiveness or performance measures for

---

[4] Anthony E. Boardman et al., *Cost-Benefit Analysis: Concepts and Practice*, 5th ed. (Cambridge: Cambridge University Press, 2018), 35.
[5] For a fuller discussion of CEA, *see* Peter J. Neumann et al., eds., *Cost-Effectiveness in Health and Medicine*, 2nd ed. (New York: Oxford University Press, 2016).

the alternative policy options.

With regard to measuring costs, you should be sure to include all the important costs to society, whether public or private, when feasible.[6] Regulations may also yield cost savings (*e.g.*, energy savings associated with new technologies). The numerator in a cost-effectiveness ratio should reflect net costs, defined as the gross cost incurred to comply with the requirements (sometimes called "total" costs) minus any cost savings. You should be careful to avoid double-counting effects in both the numerator and the denominator of cost-effectiveness ratios. For example, it would be incorrect to reduce gross costs by an estimated monetary value on life extension if life-years are already used as the effectiveness measure in the denominator.

In constructing measures of "effectiveness," final outcomes, such as injuries reduced, lives saved, or life-years saved, are preferred to measures of intermediate outputs, such as tons of pollution reduced, crashes avoided, or cases of disease avoided. When the quality of the measured unit varies (*e.g.*, acres of wetlands may vary substantially in terms of their ecological benefits), it is important that the measure capture the variability in the value of the selected "outcome" measure (*e.g.*, an index value that weights the quality of each acre). You should provide an explanation of your choice of effectiveness measure.

Cost-effectiveness ratios need to be treated with great care. They suffer from the same drawbacks as benefit-cost ratios. The alternative that exhibits the smallest cost-effectiveness ratio may not be the best option, just as the alternative with the highest benefit-cost ratio is not always the one that maximizes net benefits. Incremental cost-effectiveness analysis (discussed later in this section) can help to avoid mistakes that can occur when policy choices are based on average cost-effectiveness.

CEA can also be misleading when the "effectiveness" measure does not appropriately weight the consequences of the alternatives. For example, if effectiveness were measured in tons of reduced emissions encompassing multiple types of pollutants, cost-effectiveness estimates will be misleading unless each ton of reduced emissions of each pollutant results in the same health and environmental benefits. Such simplified effectiveness measures should generally be avoided.

When you have identified a range of alternatives (*e.g.*, different levels of stringency), you should determine the cost-effectiveness of each option compared with the baseline as well as its incremental cost-effectiveness compared with successively more stringent requirements. Ideally, your CEA would present an array of cost-effectiveness estimates that would allow comparison across alternatives. However, analyzing all possible combinations is not practical when there are many options (including possible interaction effects). In these cases, you should use your judgment to choose reasonable alternatives for careful consideration.

[6] Gillian D. Sanders et al., "Recommendations for Conduct, Methodological Practices, and Reporting of Cost-Effectiveness Analyses: Second Panel on Cost-Effectiveness in Health and Medicine," *JAMA* 316, no. 10 (2016): 1093-1103 and David D. Kim et al., "Perspective and Costing in Cost-Effectiveness Analysis, 1974–2018," *PharmacoEconomics* 38, no. 10 (2020): 1135-1145 warn about numerous inconsistencies in the published health and medical cost-effectiveness literature. For a database of this literature, *see,* "Cost-Effectiveness Analysis (CEA) Registry," Center for the Evaluation of Value and Risk in Health, https://cevr.tuftsmedicalcenter.org/databases/cea-registry.

When constructing and comparing incremental cost-effectiveness ratios, you should be careful to determine whether the various alternatives are mutually exclusive or whether they can be combined. If they can be combined, you should consider which alternatives might be favored under different regulatory budget constraints (implicit or explicit). You should also make sure that inferior alternatives identified by the principles of strong and weak dominance are eliminated from consideration.[7]

When regulation may yield several different beneficial outcomes, a cost-effectiveness comparison becomes more difficult to interpret because there is more than one measure of effectiveness to incorporate in the analysis. To arrive at a single measure, you will need to weight the value of disparate benefit categories, but this computation raises some of the same difficulties you will encounter in BCA. If you can assign a reasonable monetary value to all of the regulation's different benefits, then you should do so. But in this case, you will be doing BCA, not CEA.

When you can estimate the monetary value of some, but not all, of the benefits of a regulation, but cannot assign a monetary value to the primary measure of effectiveness, the appropriate approach is to subtract the monetary value of the estimated benefits from the gross cost estimate to yield an estimated net cost. (This net cost estimate for the regulation may turn out to be negative: that is, the monetized benefits exceed the cost of the regulation.) If you are unable to estimate the value of some of the benefits, the cost-effectiveness ratio (the net costs per unit of the outcome variable) will be overstated, and this should be acknowledged in your analysis. CEA does not yield an unambiguous choice when there are benefits or costs that have not been incorporated in the net-cost estimates. You also may choose to use CEA to compare regulatory alternatives in cases when the statute specifies the level of benefits to be achieved.

OMB does not require agencies to perform cost-effectiveness analysis. In fact, OMB encourages agencies to use BCA as the typically more informative analytical approach.

3. Scope of Analysis

a. Spatial Scope of Analysis

In many circumstances, your primary analysis should focus on the effects of a regulation that are experienced by citizens and residents[8] of the United States (which will often be the primary effects of the regulation). When feasible and appropriate, all such important effects should be included, regardless of whether they result from a regulation's domestic applicability, or from a regulation's impact on foreign entities. Effects on foreign entities may arise through markets (*e.g.*, regulatory costs incurred by foreign producers that affect U.S. consumers or

---

[7] Peter J. Neumann et al., eds., *Cost-Effectiveness in Health and Medicine*, 2nd ed. (New York: Oxford University Press, 2016). An option strongly dominates another option if it is more effective and less costly; an option weakly dominates another option if it is more effective and equally costly, or equally effective and less costly.
[8] The term "citizen" in this Circular refers to a person who is a citizen or national of the United States. The term "residents" in this Circular includes all non-U.S. citizens who live in the United States.

AR_003118

investors) or outside of markets (*e.g.*, changes in foreign ecosystem services[9] that affect U.S. citizens and residents but are not reflected in market transactions). Relevant effects also include the effects of a regulation on U.S. strategic interests, including the potential for inducing strategic reciprocity or other policy changes from actors abroad, or effects on U.S. government assets located abroad. Such effects are particularly likely to occur when your regulation bears on a global commons or a global public good.[10] In addition, relevant effects include those that occur entirely outside the United States when they affect U.S. citizens and residents, such as effects experienced by citizens residing abroad. These examples of relevant effects experienced by U.S. citizens and residents are not exhaustive, and appropriate care should be taken to identify all such important effects in your regulatory analysis. To better inform policymakers and the public of the effects of your regulation, it may be appropriate to also analyze effects on noncitizens residing abroad[11] in a supplementary analysis when your primary analysis focuses on the effects on U.S. citizens and residents.

In certain contexts, it may be particularly appropriate to include effects experienced by noncitizens residing abroad in your primary analysis. Such contexts include, for example, when:

- assessing effects on noncitizens residing abroad provides a useful proxy for effects on U.S. citizens and residents that are difficult to otherwise estimate;
- assessing effects on noncitizens residing abroad provides a useful proxy for effects on U.S. national interests that are not otherwise fully captured by effects experienced by particular U.S. citizens and residents (*e.g.*, national security interests, diplomatic interests, etc.);
- regulating an externality on the basis of its global effects supports a cooperative international approach to the regulation of the externality by potentially inducing other countries to follow suit or maintain existing efforts; or
- international or domestic legal obligations require or support a global calculation of regulatory effects.

When your primary analysis focuses on the global effects of the regulation, it is generally appropriate to produce a separate supplementary analysis of the effects experienced by U.S. citizens and residents, unless you determine that such effects cannot be separated in a practical and reasonably accurate manner in light of the factors detailed above.[12]

---

[9] See the section "*Accounting for the Benefits and Costs from Environmental Services, Ecosystem Services, and Natural Capital*" regarding ecosystem services.
[10] See the section "*Externalities, Common Property Resources, Club Goods, and Public Goods*" for discussion of these concepts.
[11] The term "noncitizen" in this Circular refers to a person who is not a citizen or national of the United States. The phrase "noncitizens residing abroad," therefore, refers to those residing in countries other than the United States who are not U.S. citizens or nationals.
[12] For example, OMB determined in 2021, in its role as a co-chair of the Interagency Working Group on the Social Cost of Greenhouse Gases (IWG), that the effects of changes in greenhouse gas emissions experienced by U.S. citizens and residents could not be separated from the global effects of changes in greenhouse gas emissions in a practical or reasonably accurate manner. At the time, OMB and the IWG noted available models could produce only an unreasonably incomplete underestimate of damages accruing to U.S. citizens and residents. OMB and the IWG recommended use of the IWG's global estimates of damages because—among other reasons—regulating greenhouse gas emissions on the basis of their global effects supports a cooperative international approach to the

You should be consistent in your treatment of noncitizens residing abroad in your benefit and cost estimates. If you include some effects experienced by such noncitizens in your primary analysis, consistency generally requires also including countervailing effects on noncitizens residing abroad in your primary analysis. For example, if benefits that are experienced by noncitizens residing abroad are included in your analysis, compliance costs borne by noncitizens residing abroad should generally be included in your analysis as well, and vice versa. Whatever decisions you make regarding the inclusion and exclusion of effects in your analysis, the basis for those decisions should be transparent and clear, and should focus on capturing the significant effects of a regulation. Similarly, you should be transparent about any data limitations or other sources of uncertainty regarding who will experience regulatory impacts.

You should recognize that regulatory effects on firms, nongovernmental organizations, or other similar entities ultimately accrue to those entities' individual consumers, owners of assets or liabilities, workers, program beneficiaries, and so forth, and those individuals may comprise a mix of U.S. citizens and residents and noncitizens residing abroad.[13] You should consider the principles above in determining how to appropriately include or exclude such effects. When it is too difficult in practice to separate such regulatory impacts—for example, effects on the foreign versus U.S. owners, customers, or employees of regulated firms may not be practical to separate—you should be consistent and transparent in whether and how important impacts to noncitizens residing abroad are included in your analysis.

Consistent with Executive Order 13609,[14] agencies often engage in international regulatory cooperation (IRC), which can include information exchange, work sharing, scientific collaboration, pilot programs, and alignment of regulatory requirements. IRC activities may aim to address or prevent unnecessary differences between the regulatory approaches of U.S. agencies and those of their foreign counterparts that may unnecessarily impair economic growth, innovation, competitiveness, and job creation. In addition to the conditions above, inclusion of the foreign effects of a regulation in your primary analysis will often be appropriate when such analysis would help inform cooperative efforts with foreign regulators that aim to minimize

---

regulation of greenhouse gas emissions by potentially inducing other countries to follow suit or maintain existing efforts, and the global estimates were a useful proxy for effects on U.S. citizens and residents that were difficult to estimate and for effects on U.S. national interests that were not otherwise fully captured. *See* Interagency Working Group on Social Cost of Greenhouse Gases, *Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates under Executive Order 13990* (February 2021), https://www.whitehouse.gov/wp-content/uploads/2021/02/TechnicalSupportDocument_SocialCostofCarbonMethaneNitrousOxide.pdf.

[13] Unless it can be demonstrated using appropriate empirical evidence that regulatory costs imposed on foreign manufacturers or other producers will not be passed through to U.S. citizens or residents, a reasonable estimate of the portion of the costs that are passed through should be included in a primary regulatory analysis that focuses exclusively on effects that are experienced by U.S. citizens and residents. You should transparently present the total costs imposed abroad to clarify your estimate of the share of those costs that are passed through. Similarly, such an analysis should not exclude benefits to U.S. persons merely because they flow through foreign channels, but rather provide a reasonable estimate of the benefits that are passed through.

[14] Exec. Order No. 13609 of May 1, 2012 (Promoting International Regulatory Cooperation), 77 Fed. Reg. 26,413 (May 4, 2012).

unnecessary regulatory differences and meet shared challenges.[15] As noted below—see the section "*Showing Whether Regulation at the Federal Level Is the Best Way to Solve the Problem*"—you should, when required or otherwise appropriate, evaluate a regulation's effects on international trade. Changes to import and export volumes may be useful metrics that form part of your analysis, but changes in such volumes are not themselves welfare measures.

Finally, you should seek to ensure that you are providing informative analysis to policymakers and the public. For example, regulations may impose costs on international visitors entering the United States such as through pre-arrival out-of-pocket expenses (*e.g.*, fees for medical exams); screening or testing products or people prior to entry into the United States; or delay at the port of entry due to additional processing requirements. While the most directly affected individuals may include noncitizens residing abroad, you should still estimate and present the potential effects of the regulation on non-immigrant visa holders, and report these effects in your primary regulatory analysis to ensure that the regulatory analysis is informative.

b. Temporal Scope of Analysis

The time frame for your analysis should include a period before and after the date of compliance that is long enough to encompass all the important benefits and costs likely to result from the regulation.[16] A logical beginning point for your stream of estimates would be the year in which the regulation will begin to have effects, even if that is expected to be some time in the future.[17] The ending point for your analysis should be far enough in the future to encompass, to the extent feasible, all the important benefits and costs likely to result from all regulatory alternatives being assessed.[18] You generally should not, for example, end an analysis at a point before benefits or costs are likely to change in a way that could change the sign of the estimated net benefits, change the relative ranking of regulatory alternatives, or otherwise have effects relevant to the public or policymakers. If benefits or costs become more uncertain or harder to quantify over time, it does not follow that you should exclude such effects by artificially shortening your analytic time frame; instead, consult—as appropriate—the discussion in the section "*Treatment of Uncertainty*" or "*Accounting for Benefits and Costs that Are Difficult to Quantify or Monetize*."

[15] Regulatory Working Group, *Regulatory Working Group Guidelines: Executive Order 13609 "Promoting International Regulatory Cooperation"* (June 26, 2015), https://www.whitehouse.gov/wp-content/uploads/legacy_drupal_files/omb/inforeg/inforeg/eo_13609/eo13609-working-group-guidelines.pdf; *see also* Administrative Conference of the United States, *Recommendation 2011-6: International Regulatory Cooperation*, 77 Fed. Reg. 2259 (Jan. 17, 2012), https://www.acus.gov/document/international-regulatory-cooperation (recommending that agencies document cost savings and regulatory benefits from mutual regulatory arrangements with foreign authorities).

[16] For example, when assessing the benefits of a regulation that could prevent a catastrophic event with some probability, it may be appropriate for you to consider not only the near-term effects of averting the catastrophic event on those who would be immediately affected, but also the long-run effects on others—including future generations—who would be affected by the catastrophic event.

[17] You may also choose to use a different starting date if you have compelling reasons to do so.

[18] For example, if an alternative would extend a regulation's compliance date to five years after issuance, the time horizon of the regulatory analysis should be meaningfully longer than five years, even if the regulation as proposed or finalized would have effects that are estimated to plateau before five years due to an earlier compliance date.

4. Developing an Analytic Baseline

The benefits and costs of a regulation are generally measured against a no-action baseline: an analytically reasonable forecast of the way the world would look absent the regulatory action being assessed, including any expected changes to current conditions over time. Such a forecast focuses on the issues or phenomena relevant to the effects of the regulation—for example, the number of foodborne illnesses, the level of emissions, the number of automobile crashes, or the availability of wheelchair-accessible facilities—that would most likely exist or occur without the regulation. This forecast should, to the extent feasible, be grounded in sound theories and empirical evidence about current conditions and ongoing and anticipated future trends in the areas of interest.[19]

The choice of appropriate baseline may require consideration of a wide range of potential factors, including:

- evolution of markets;
- changes in regulations promulgated by the agency or other government entities;
- other external factors affecting markets;
- the degree of compliance by regulated entities with other regulations; and
- the scale and number of entities or individuals that will be subject to, or experience the benefits or costs of, the regulation.

In some cases, it may be reasonable to forecast that the world absent the regulation will resemble the present. In other cases, particular attention should be paid to ways in which conditions will change absent the regulation—*e.g.*, technological advances, demographic changes, changes in the economy, or alterations to the climate—that will significantly affect the estimated effects of the regulation. Consulting with other Federal agencies that have specific data or models on such trends may be helpful.

If a harm addressed by a regulation is expected to become more severe over time, the baseline should reflect that trend. Thus, when calculating the effects of the regulation, your analysis would use a baseline in which the harm is becoming more severe. Depending on the specific circumstances, the use of this baseline may result in greater benefits (because the harm being addressed by the regulation is becoming more severe), greater costs (because larger investments may be required to address the increasing severity of the harm), or both. On the other hand, if a harm is expected to become less severe over time, your baseline should reflect that assessment as well. In either case, the use of an appropriate baseline—meaning one in which the severity of the harm changes over time in a manner consistent with a reasonable assessment of the future—could potentially yield substantially different estimates of the net benefits (or other impacts) of a regulation than a baseline in which the harm is assumed to remain at current levels.

Your baseline should reflect, when appropriate and feasible, the future effect of current

[19] The same data that are used to establish the analytic baseline are likely to be relevant to the regulatory analysis's discussion of the need(s) for Federal regulation; see the section "*Identifying the Potential Needs for Federal Regulatory Action*" for more details.

government programs and policies. More specifically, the baseline should attempt to reflect relevant final rules (especially if their requirements are being modified by the regulation under consideration) and proposed rules or other previously announced policy changes that the agency is reasonably certain will be finalized before the rule under consideration is finalized.[20] Agencies are encouraged to consider the likely paths of future government programs and policies when relevant and appropriate, either reflecting them in the primary or in a supplemental baseline (in either approach, carefully describe the ways in which the future government programs or policies may affect your analysis). The regulations and policies reflected in a primary baseline and any supplementary baselines at the final rule stage for a given rule typically will align with those reflected at the proposed rule stage, but the baseline may need to be adjusted if, for example, the finalization of a separate (but related) proposed rule has been unexpectedly delayed.[21] For guidance about incorporating the extent of compliance with earlier regulations in an analytic baseline, please see the section "*Accounting for Compliance and Take-up*" for more details.[22]

Regulatory analysis should assist policymakers in choosing among policy options available to the regulating agency at the time decisions are made and inform the public about the likely effects of the policies adopted. In general, an agency's first regulatory action implementing a new statutory authority should be assessed in a manner that accounts for the effects of the statute itself—that is, assessed against a without-statute baseline.[23] However, in some cases, substantial portions of a regulation may simply restate statutory requirements that are self-implementing even in the absence of the regulatory action or over which an agency clearly has essentially no regulatory discretion. In these rare cases, you may use a with-statute baseline in your regulatory analysis, focusing on the discretionary elements of the action and potential alternatives. Such an analysis should be accompanied by a brief description of (and citation to) the relevant statute. If you plan to use a with-statute baseline for a regulation, you should consult with OMB as early as possible in the process of developing your regulatory analysis, including about how to describe—in sufficient detail—the with-statute baseline that is being used.

When choosing an appropriate analytic baseline, analysts should generally consider: transparency, the goal of informing policy decisions, data availability, a general emphasis on

---

[20] The effects of regulatory and other policy changes induced by the regulation under consideration should not be incorporated into your baseline. Furthermore, if two or more related regulations are issued in sequence, the most appropriate approach would generally be for the second regulation to account for the effects of the first regulation in its baseline. However, there may be exceptions to this general guidance if the first regulation induces the later regulatory or other policy changes. Please consult with OMB for more specific guidance in particular cases.
[21] It facilitates analysis of a subsequent final rule for the analysis of a proposed rule to include at least one baseline that omits other proposals. For example, if finalization of the relevant other proposals is delayed, then adjustments of the final rule's analysis to account for these circumstances may involve minimal effort if a proposal-excluding baseline can be carried forward from the preceding proposed rule.
[22] Updating assessments of compliance illustrates how analytic approaches—including choice of baseline—that serve the purpose of informing policy options at the time decisions are made do not universally lend themselves to aggregation of estimates across regulations over time.
[23] The terms "pre-statute baseline" and "post-statute baseline" were used in OMB Circular No. A-4 as originally issued in 2003. However, as noted elsewhere, the baseline for a regulatory analysis is (and has been) the predicted future state of the world in the absence of the policy being assessed, so more precise terms—that avoid the potentially misleading temporal element of the prefixes "pre-" or "post-"—without-statute or with-statute are now used.

empirical evidence, and the timing of interrelated policies. Several important points and illustrative cases are discussed below:

- An agency's regulation should generally be assessed in a manner that compares against a state of the world that accounts for any relevant previously issued regulations as though there has not been any intervening sub-regulatory action (*e.g.*, agency guidance). Attention should also be given to analysis that isolates meaningful changes relative to any such sub-regulatory action in a supplementary analysis. This dual-baseline approach allows for assessment relative to both a previous regulation and any subsequent guidance. Relatedly, the dual-baseline approach acknowledges the range of possible future behavior patterns by affected entities, which may not match what is observed at the time the regulatory analysis is conducted.
- Subsequent finalization of an interim final rule (IFR) should generally be assessed with at least two baselines: one with a state of the world that (hypothetically) lacks the IFR *and* one that includes the IFR (if the finalized rule differs from the IFR). In order to ensure an informative analysis, the former should be your primary baseline.[24] When appropriate, analysis of a subsequent finalization of an IFR could refer back to the analysis in the IFR for the first baseline, while also providing a new analysis that isolates changes relative to the IFR.
- If a recently finalized regulation is clarified, delayed, or otherwise revised or reversed by a new agency action, the primary baseline of the new action would be a baseline where the recently finalized regulation is issued as originally stated. In these cases, estimates from the earlier regulation's regulatory analysis are presumably readily available and, especially if the previous regulation is very recent, probably can be used to characterize that primary baseline in assessment of the new action. However, analysts are encouraged to update this analysis with an assessment that reflects newly available data or meaningful updates or changes in circumstances that affect the baseline.
- If a previous policy has been clarified, delayed, or otherwise revised by a new regulatory or sub-regulatory action, then among the factors needing careful accounting are costs and benefits associated with past compliance activity that have already been incurred. The analysis should carefully document costs that have been incurred, and cannot be recovered (and that may yield benefits), versus other types of costs.
- If a regulatory preamble states or implies that changes caused by a regulation will have large effects, but the regulatory analysis states that there will be minimal effects, it may be that the preamble and analysis are comparing the regulation to different baselines. If a given baseline is important enough to inform discussion in the preamble, then there should generally be consideration given to addressing it in the regulatory analysis as well.

The preceding discussion notes various circumstances in which multi-baseline analysis may be the most informative approach to assessing a policy's impacts. Even in multi-baseline analysis, benefits and costs must be compared to each other only when assessed relative to the same baseline.[25] Moreover, when an agency considers one category of impact (benefits or costs) to be appropriately assessed relative to a particular baseline, the other types of impacts should

[24] Consistent with the next bullet point, the primary baseline of the *rescission* of an IFR should be a baseline that includes changes relative to a state of the world in which the IFR remains in place.
[25] Assessment of policy alternatives should also be presented relative to a consistent baseline.

also receive analytic attention relative to that same baseline. You may also consider exploring, in sensitivity analyses, the reasonableness of the baselines used. For each baseline you use, it is helpful to identify the key uncertainties in your forecast. Regardless of the number of baselines used in the analysis, presentation of effects without transparent characterization of the relevant baseline(s) is generally not appropriate.

Uncertainty about outcomes in the baseline and uncertainty about outcomes in a regulatory alternative both contribute to uncertainty about the relative magnitude of benefits and costs. See the section "*Treatment of Uncertainty*" for more information on accounting for uncertainty (for example, that section's guidance might facilitate the use of expert elicitation as a tool to address uncertainty in long-term baseline conditions). Discussing uncertainty in the baseline is particularly important when it informs uncertainty about a regulation's net benefits. Baseline-related uncertainty may be less analytically important in cases in which a source of uncertainty will affect outcomes in both the baseline and the regulatory alternatives equally, and thus have little effect on the difference between the two.

5. Identifying the Potential Needs for Federal Regulatory Action

Section 1(a) of Executive Order 12866, "The Regulatory Philosophy," states that "Federal agencies should promulgate only such regulations as are required by law, are necessary to interpret the law, or are made necessary by compelling need, such as material failures of private markets to protect or improve the health and safety of the public, the environment, or the well-being of the American people." Section 1(b), "The Principles of Regulation," further provides that each agency, as applicable and permitted by law: "shall identify the problem that it intends to address (including, where applicable, the failures of private markets or public institutions that warrant new agency action) as well as assess the significance of that problem."

Section 6(a)(3)(B)(i) of Executive Order 12866 requires agencies to provide OMB's Office of Information and Regulatory Affairs (OIRA) with "text of the draft regulatory action, together with a reasonably detailed description of the need for the regulatory action and an explanation of how the regulatory action will meet that need," in addition to the required assessments and analyses of benefits and costs. It is helpful for agencies to describe the need for action in their regulatory preambles. In addition, including a summary in regulatory analyses of the needs being addressed may provide useful background and help ensure that the description of the needs informs the scope of the analyses (and vice versa) to the extent relevant, appropriate, and consistent with the best available evidence and best practices for objective analysis.

Regardless of its nature, you should generally describe the potential need for a regulation qualitatively and (when applicable) quantitatively. It is important to analyze any potential need before determining that it is present and relevant in your particular regulatory context. Your analysis of the effects of the regulation should not presuppose that there is a need for the regulation, and your analysis of the potential need for the regulation should not presuppose the effectiveness of your regulation.

Modeling underlying market, institutional, or behavioral distortions is a standard starting point for conducting benefit-cost analysis of a regulatory action or other government intervention,[26] but these concepts do not capture all the underlying circumstances that may spur regulatory action. Common needs for regulation include, but are not limited to:

- correcting market failure, which may implicate externalities, common property resources, public goods, club goods, market power, and imperfect or asymmetric information;
- addressing behavioral biases;
- improving government operations and service delivery;
- promoting distributional fairness and advancing equity; and
- protecting civil rights and civil liberties or advancing democratic values.

A regulation can be needed for multiple interconnected reasons, several distinct reasons, or one primary reason. For example, regulations that address a market failure may also promote distributional fairness. Regardless of the particular reasons for the regulation, all regulations can benefit from evidence-based qualitative and (when applicable) quantitative analysis of their effects. Identifying the potential need or needs for regulation is not about "checking a box" to confirm there is at least one need; for example, if an agency identifies that a regulation is necessary to implement or interpret a statute, that does not end the inquiry. Instead, analysts should conduct reasonable inquiries to identify any relevant potential needs for regulatory action—such as correcting a market failure—because doing so may inform the analysis of important categories of benefits and costs.

a. Potential Needs that Federal Regulatory Actions Commonly Address

i. Externalities, Common Property Resources, Club Goods, and Public Goods

An externality can occur when one party's actions impose uncompensated benefits or costs on another party.[27] Environmental problems are a classic case of externalities. For example, the emissions from a factory may adversely affect the health of local residents while soiling the property in nearby neighborhoods; an externality exists because the marginal cost of producing the goods at the factory does not account for these effects, enabling the factory to sell its goods at a lower price. In theory, if bargaining were costless and all property rights were well defined, fully informed people could eliminate externalities through bargaining without the need for government regulation.[28] From this perspective, externalities can arise from high transaction costs or poorly-defined/costly-to-enforce property rights that prevent people from reaching efficient outcomes through bargaining.

Externalities are related to the concepts of common pool resources (resources that are rivalrous and non-excludable), club goods (which are non-rivalrous and excludable), and public goods (which are non-rivalrous and non-excludable). A good is non-rivalrous if there is no

marginal cost to also providing it to another individual. A good is non-excludable if the provision of the good to some individuals cannot occur without providing the same amount of goods to other individuals, free of charge. Common pool resources, such as many fisheries or the broadcast spectrum, may become congested or overused. Public goods, such as defense or basic scientific research, by contrast, do not generally suffer from congestion problems, but may be underprovided because their benefits fall on a large number of people while their costs often fall only on a few.[29] Externalities can also be associated with positional goods, which can exist if any increase in the relative position of one person lowers the relative position of others (and vice versa),[30] or network benefits, which can exist when a greater degree of adoption and standardization in the use of a good or service increases the value of a good or service for all users. For example, network benefits are generally realized when there is standardization of which side of the road cars drive on, of the gauge of railroad tracks, or of weights and measures used in commerce. Regulatory benefits and costs should reflect relevant positive and negative externalities and the extent to which they interact with the regulation being analyzed, regardless of the form those externalities take.

ii. Market Power

A firm or group of firms has market power as a seller ("monopoly power" or "oligopoly power") when it can influence or determine the price at which it sells its goods and services; analogously, a firm or group of firms has market power as a purchaser ("monopsony power" or "oligopsony power") when it can influence or determine the wages or other prices paid for goods and services it buys. Firms may also have market power that manifests in non-price ways, such as the ability to decrease product quality, restrict the range of products available to consumers, worsen wage or non-wage attributes of employee positions, or disproportionately influence the terms of service available to consumers, workers, or other firms. Firms may be able to exercise greater market power on those who are in more disadvantaged and vulnerable communities or groups.[31] Firms may exercise market power collectively or unilaterally. Government action can facilitate market power, such as when regulatory actions exclude lower-cost imports. More generally, market power may arise from a variety of sources, including but not limited to barriers to entry for competitors, economies of scale, control of inherently scarce resources, intellectual property protections, privileged access to infrastructure, control over commercial platforms or networks, unlawful exclusionary conduct, and monopoly access to detailed consumer data.

There are limited circumstances in which government may choose to grant a monopoly in a market and regulate the monopolist. If a market can be served at lowest cost only when production is limited to a single producer—historically, local gas and electricity distribution

[29] There may be instances when your regulation provides information that is a public good and addresses incomplete/imperfect or asymmetric information, which is discussed below. For example, regulations requiring public disclosure of information may both provide a public good and alter transactions that would have otherwise been characterized by asymmetric information. When discussing the potential need for your regulation in such cases, your discussion of market failures should be inclusive, addressing these different reasons for regulation together.

Doleac and Luke C.D. Stein, "The Visible Hand: Race and Online Market Outcomes," *Economic Journal* 123, no. 572 (2013): F469-F492.

services have been examples—a natural monopoly is said to exist. In such cases, the government may choose to grant a monopoly and regulate prices or production decisions.

Analyses should reflect that technological advances often affect economies of scale. As a result, technological advances may transform what was once considered a natural monopoly into a market where competition can flourish. Alternatively, technological advances can transform what was once considered a competitive market into a monopolistic or monopsonistic one. Please see the section "*Accounting for the Effects of Market Power*" for further discussion of related analytic issues.

iii. Asymmetric or Imperfect Information

Asymmetric information exists when one party in a transaction has more information than the other, which can result in a market failure. Asymmetric information provides an advantage to one side of a market over the other when negotiating a transaction. Asymmetric information can also worsen inefficient dynamics that may exist between principals and their agents (principal-agent problems). Imperfect information exists when buyers and sellers do not have all of the necessary information to make an informed decision about the transaction. Imperfect information may lead to inefficient markets.

Asymmetric and imperfect information can be common features of markets. However, although the market may supply less than the full amount of information, the amount it does supply may be reasonably adequate in light of the marginal benefits and costs of producing more information, and therefore may not require government regulation. Sellers often have an incentive to provide information through advertising that can increase sales by highlighting distinctive characteristics of their products. Buyers may also acquire reasonably adequate information about product characteristics through other channels, such as a seller offering a warranty or a third party providing information. Nonetheless, absent government regulation, imperfect or asymmetric information substantially affects important sectors of the economy, such as the agricultural, insurance, consumer credit, healthcare, and real estate markets.[32] Imperfect information can be relevant to game-theoretic modeling of interactions between market participants,[33] and should be given consideration when performing such modeling as part of a regulatory analysis.

iv. Behavioral Biases

Behavioral biases can be categorized in two groups: limitations on information processing and decision-making biases.[34]

AR_003128

Because of limited capacity to process information, even when adequate information is available, people can make systematic mistakes; limited attention, focus, and time can lead to the use of heuristics (rules of thumb). These heuristics may or may not be reasonable at the level of individual decision-making, but they can produce serious errors. If, for example, people have a clear mental image of an event (which makes it cognitively "available," or vivid and salient), they might overstate the probability that such an event will occur (*e.g.*, the risk of airplane travel may be overestimated following an airplane crash due to intense media coverage). This is an example of the use of a well-known heuristic, the availability heuristic, which might lead to availability bias.[35] Such heuristics can lead to inefficient outcomes when they produce systematic errors.

People also exhibit various decision-making biases,[36] such as those stemming from framing effects, anchoring effects, loss aversion, present bias, unrealistic optimism, inertia, and a preference for the status quo.[37] Another sort of decision-making bias stems from challenges like imperfect self-control. When individuals exhibit imperfect self-control, they make a decision that increases short-term well-being by less than it decreases future well-being (appropriately discounted; see the section "*Discount Rates*" for more information). Imperfect self-control is often associated with present bias.

Unlike most of the types of market or public institution failure[38] discussed in this section, accounting for behavioral biases requires a departure from an assumption that typically underlies regulatory analyses conducted in accordance with this Circular: that individuals optimize their own lifetime well-being subject to budget and other relevant constraints.[39] You should carefully consider the degree to which the evidence available indicates that behavior reflects fully rational preferences and the degree to which it indicates that such behavior is the product of a behavioral bias observed in, or applicable to, the specific regulatory context.[40] When you have gathered evidence that the latter is the case—for example, studies demonstrating private undervaluation or overvaluation of relevant consumer products—that evidence will likely provide a key input in your quantification of regulatory net benefits.

---

[35] Amos Tversky and Daniel Kahneman, "Availability: A Heuristic for Judging Frequency and Probability," *Cognitive Psychology* 5, no. 2 (1973): 207-232.

[36] Such biases may result from internalities: uncompensated harms that people impose on their future selves. The concept of internalities was adapted from the canonical market failure of externalities, with a consumer's future self as the third-party on whom direct parties to a transaction (including the consumer's current self) impose costs. As with externalities' interpersonal effects, internalities can reduce intrapersonal welfare when the present value of a harm to one's future self exceeds the value of the benefits to one's present self. David L. Weimer, *Behavioral Economics for Cost-Benefit Analysis: Benefit Validity When Sovereign Consumers Seem to Make Mistakes* (Cambridge: Cambridge University Press, 2017); Raj Chetty, "Behavioral Economics and Public Policy: A Pragmatic Perspective," *American Economic Review* 105, no. 5 (2015): 1-33.

[37] Thomas Gilovich, Dale Griffin, and Daniel Kahneman, eds., *Heuristics and Biases: The Psychology of Intuitive Judgment* (Cambridge: Cambridge University Press, 2002).

[38] See the section "*Improving Government Operations and Service Delivery*."

[39] As discussed in the section "*The Key Concepts Needed To Estimate Benefits and Costs*," internalities can also affect the interpretation of willingness to pay and willingness to accept evidence.

[40] Lisa A. Robinson and James K. Hammitt, "Behavioral Economics and the Conduct of Benefit-Cost Analysis: Towards Principles and Standards," *Journal of Benefit-Cost Analysis* 2, no. 2 (2011).

v. Improving Government Operations and Service Delivery

Regulations are necessary for the day-to-day functioning of government and can also help promote a government that operates more smoothly, is more transparent, and delivers public services more efficiently. For example, a regulation may further effective government operations by setting performance criteria that government must follow. Regulations can also help government deliver services to more individuals at lower cost, such as by reducing administrative burdens or by simplifying public-facing or internal processes. When any public institution could take action to reduce costs without proportionately reducing the quantity or quality of services it provides, or improve the quantity or quality of services it provides without proportionately increasing costs, the fact that such an action has not been taken can be referred to as a failure of public institutions.

vi. Promoting Distributional Fairness and Advancing Equity

Regulations can play a key role in promoting distributional fairness and advancing equity. Such regulations are sometimes issued pursuant to statutes that reflect congressional determinations that advancing these goals serves a compelling public need. For example, some statutes create social welfare programs, such as Medicaid or the Supplemental Nutrition Assistance Program. Congress has enlisted agencies to implement these programs, including through agency regulations addressing who is eligible for program benefits and what sorts of benefits they may receive under various circumstances.

vii. Protecting Civil Rights and Civil Liberties or Advancing Democratic Values

Government plays a key role in protecting civil rights and civil liberties and in safeguarding democratic institutions. Regulations can protect free exercise of religion, secure due process rights, and promote personal freedom and dignity. Regulations can prevent discrimination by public or private actors. Regulations can also protect privacy, by ensuring that government and private entities that lawfully collect, maintain, and use large amounts of personal information do so in a way that protects and promotes individual privacy.

b. Integrating Assessments of Potential Needs for Federal Regulatory Action into the Regulatory Analysis

Observing the mere possibility of market failure, failure of public institutions, or behavioral biases is only an initial step in your analysis; you should consider the likelihood of various explanations for why the phenomenon under consideration occurs, and tailor your regulatory analysis accordingly. Ideally, to the extent feasible, you should quantify the extent of any relevant market failure, failure of public institutions, or behavioral bias, with the resulting estimates integrated into your regulatory analysis. You could also integrate estimates of distributional effects into your analysis, as explored in the section "*Distributional Effects*" below. Quantitative (or qualitative) assessments of other potential needs for regulation can also be used as inputs to benefit-cost analysis or cost-effectiveness analysis.

As various portions of a regulatory analysis are developed, there should be a continual assessment of whether the analysis as a whole achieves internal consistency. For example, if a market failure, failure of public institutions, or behavioral bias cannot be identified, then an estimate of positive monetized net benefits may be the result of missing cost categories, inappropriate methods or data, or implausible assumptions.[41] If negative net benefits are estimated after accounting for all important monetized and non-monetized effects, then the size of the identified market failure, failure of public institutions, or behavioral biases or the degree to which the regulation addresses those phenomena may need to be qualified. More generally, if the analysis identifies categories of benefits or costs beyond those implicated by the potential need(s) for regulation as originally articulated, the relationship between those effects and another market failure, failure of public institutions, or behavioral bias that the regulation addresses is something that you should endeavor to describe.

c. Showing Whether Federal Regulation Is the Best Way to Solve the Problem

It can be informative to consider other policy actions in addition to, or instead of, Federal regulation. Alternatives to Federal regulation that may be appropriate in certain contexts, or analytically informative even when not feasible as policy options, include antitrust enforcement, consumer-initiated litigation in the product liability system, reframing programmatic context to induce behavior change, or administrative compensation systems. These other approaches will sometimes be a means of securing some of the benefits of regulation. In many contexts, however, these alternatives will not be available at all or, even if they are available, they will not be as efficient or as effective as Federal regulatory means of obtaining the relevant benefits.

In assessing whether Federal regulation is the best approach, it is also helpful to consider, when relevant, whether State, local, territorial, or Tribal governments are well-positioned to address the issue and whether they are acting to do so. In some cases, the relevant need for regulatory action may suggest the most appropriate governmental level of regulation. For example, problems that spill across State lines (such as acid rain, whose precursors are transported widely in the atmosphere) are probably best addressed by Federal regulation. More localized problems, including those that are common to many areas, may be better addressed locally, provided State, local, territorial, or Tribal authorities are able to do so and are effectively acting to address the relevant problem. Importantly, the fact that State, local, territorial, or Tribal authorities are empowered to address an issue does not mean that they are likely to do so effectively, universally, or at all. If State, local, territorial, or Tribal governments are failing to appropriately address a problem, analysis may indicate that Federal action is the best approach.

Generally, there are advantages and disadvantages to regulating at different levels of government. If preferences differ by region, those differences can be reflected in varying State, local, territorial, and Tribal regulatory policies. Moreover, States, localities, territories, and Tribal lands can serve as a testing ground for experimentation with alternative regulatory policies. One State can learn from another's experience while local jurisdictions may compete with each other to establish the best regulatory policies. The opposite is also possible: jurisdictions may compete in "races to the bottom," and this is of particular concern when

[41] This may not be the case if an agency that is interested in accounting for diminishing marginal utility weights benefits and costs by, for example, income; see the section "*Distributional Effects*" for more details.

activities conducted in one State or locality impose externalities on the residents of other States or localities.

Though a diversity of regulations may generate gains for the public, duplicative regulations can also be costly. The local benefits of State regulation may not justify the aggregate costs of a fragmented, inconsistent, or patchwork regulatory system, especially for regulated entities that operate or conduct commerce across multiple jurisdictions. For example, the increased compliance costs for firms to meet different State, local, territorial, and Tribal regulations may exceed any advantages associated with the diversity of State, local, territorial, and Tribal regulation. Your analysis should consider, in light of the factors above, the advantages and disadvantages of regulatory alternatives that reduce or expand State and local regulation (if such alternatives are legally available).

When feasible and appropriate, the role of Federal regulation in facilitating U.S. participation in global markets and diplomatic agreements should also be considered. Many societal concerns cannot be fully addressed through the regulatory actions of one country. Differences between the U.S. regulatory approach and those of foreign governments, though sometimes necessary, might impair the ability of American businesses to export and compete internationally. Concerns that new U.S. regulations could act as non-tariff barriers to imported goods should be evaluated carefully. Efforts to align or harmonize U.S. and international regulations may require a strong Federal regulatory role.

6. Alternative Regulatory Approaches

You should consider reasonable regulatory alternatives deserving careful analysis. In approaching the assessment of alternative regulatory approaches, you ordinarily will be able to eliminate some alternatives through a preliminary analysis, leaving a manageable number of alternatives to be evaluated according to the principles of Executive Orders 12866 and 13563.

The number and choice of alternatives selected for detailed analysis is a matter of judgment. There must be some balance between thoroughness and practical limits, such as the limits on your analytical capacity. With this qualification in mind, it is generally informative to explore modifications of some or all of a regulation's key individual attributes or provisions to identify appropriate alternatives. When feasible and appropriate, you should analyze at least three options for each key attribute or provision, including: the proposed or finalized option; at least one option that achieves additional benefits (and presumably costs more due to, for example, greater stringency); and at least one option that costs less (and presumably generates fewer benefits due to, for example, less stringency).[42] An attribute or provision is key if the choice among alternatives has substantial implications for the welfare effects of the rule.

If a regulation includes a number of distinct provisions, you should analyze the benefits and costs of alternatives to key individual provisions separately, when feasible and appropriate. If the existence of one provision affects the benefits or costs arising from another provision, the

[42] The less-costly regulatory alternative should be a policy option other than agency inaction. The anticipated state of the world in the absence of agency action restates the analytic baseline, and thus its inclusion in the alternatives assessment would not serve the goal of increasing the informational content of the overall regulatory analysis.

analysis becomes more complicated, but it is important to examine provisions separately to the extent feasible and appropriate. In such a case, you should evaluate each specific provision by determining the net benefits of the proposed regulation with and without it.

As noted at the outset of this section, it is usually not sufficiently informative simply to report a comparison of the agency's proposed or finalized option to the analytic baseline(s). When reporting the benefits and costs of alternative options, consider presenting both total and incremental benefits and costs between alternatives.[43] If doing so, you should present incremental benefits and costs as differences from the corresponding estimates associated with the next less-stringent alternative.[44] It is important to emphasize that incremental effects are usually simply differences between successively more stringent alternatives. For alternatives that cannot be ordered by stringency, this type of comparison may not be possible.

Analyzing all possible combinations of provisions is impractical if the number of provisions is large and interaction effects are widespread. You need to use judgment to select the most significant or relevant provisions for such analysis. Some regulatory alternatives may merit relatively formal assessment because they provide richer insights into evidence, models, or other analysis details than might be available from a sole focus on the regulatory approach being proposed or finalized. You are expected to document all of the alternatives that were assessed in a list or table and note which were selected for emphasis in the main analysis.

Different alternatives may also have different distributional effects; some alternatives may change distributional effects even without significantly changing stringency. When the distributional effects of your regulation merit specific attention, it may be worthwhile to consider preliminarily analyzing regulatory alternatives that may have important differences in distributional effects. See the section "*Distributional Effects*" for details regarding identifying relevant groups and approaches to analyzing distributional effects.

The following subsections list regulatory alternatives that may warrant analysis, as feasible and appropriate.

a. Different Choices Defined or Identified by Statute

When a statute establishes a specific regulatory requirement or requires an agency to periodically consider updating a regulation, it is generally helpful for the agency to also consider whether to add discretionary provisions (such as increasing stringency above the minimum set by statute or by existing regulations). When considering such discretionary provisions, you should examine the benefits and costs of reasonable alternatives that reflect the range of the agency's statutory discretion, including the specific statutory requirement.

If legal or other constraints prevent the selection of a regulatory action that best satisfies

[43] See the section "*Presentation of Results and Accounting Statement*" on how to clearly present incremental benefits and costs between alternatives.
[44] For the least stringent alternative, you should estimate the incremental benefits and costs relative to the baseline. Thus, for this alternative, the incremental effects would be the same as the corresponding totals.

the philosophy and principles of Executive Orders 12866,[45] you may consider identifying these constraints and estimating their opportunity cost (and effects more generally). Such information may, for example, be useful to Congress under the Regulatory Right-to-Know Act or in considering statutory reforms.

b. Different Compliance Dates

The compliance dates of a regulation may have an important effect on its net benefits. Benefits may vary significantly with different compliance dates when a delay in implementation may result in a substantial loss in future benefits (*e.g.*, a delay in implementation could result in a significant reduction in spawning stock and jeopardize a fishery); any reduction in benefits should be assessed against any reduction in costs from the delay. Similarly, the cost of a regulation may vary substantially with different compliance dates for an industry that requires a year or more to plan its production runs. In this example, a regulation that provides sufficient lead time is likely to achieve its goals at a much lower overall cost than a regulation that is effective immediately; that reduction in cost should be assessed against any reduction in benefits from the delay.

c. Different Methods to Ensure Compliance

There are many options for designing regulations so that compliance, and the potential benefits and costs, are far more likely to occur. For example, third-party reporting increases compliance with tax regulations, and establishing default values that will be attributed to the regulated party when it does not submit required reports creates an incentive for greater compliance.[46]

Enforcement also facilitates compliance. Federal, State, or local enforcement can include on-site inspections, periodic reporting, and noncompliance penalties structured to provide the most appropriate incentives. When alternative monitoring and reporting methods vary in their benefits and costs, you should gather evidence relevant to identifying the most appropriate method for ensuring compliance. Advances in monitoring technology should be considered in setting monitoring standards. Regarding analysis of differing levels of compliance, see the section "*Accounting for Compliance and Take-up*."

d. Different Degrees of Stringency

In general, both the benefits and costs associated with a regulation will increase with the level of stringency (although marginal costs generally increase with stringency, whereas marginal benefits may decrease). It is informative to study alternative levels of stringency to understand more fully the relationship between stringency and the size and distribution of benefits and costs among different groups. As noted previously, it may be appropriate to compare the proposed alternative to one that is less stringent and to one that is more stringent.

---

[45] As reaffirmed and elaborated upon in Executive Orders 13563 and 14094.
[46] *See* Cynthia Giles, *Next Generation Compliance: Environmental Regulation for the Modern Era* (Oxford: Oxford University Press, 2022).

e. Different Requirements for Different-Sized Entities

You should consider assessing different requirements for large and small firms (or other entities), basing the requirements on estimated differences in the anticipated costs of compliance and in the anticipated benefits. Benefits and costs can differ depending on the size of the firms being regulated. Small firms may find it more costly to comply with regulation, especially if there are large fixed costs required for compliance. This can potentially lead small firms to exit the market, resulting in reduced competition in some markets. On the other hand, it is not necessarily efficient to place a heavier burden on one segment of a regulated industry solely because it can better afford the higher cost. This has the potential to load costs on the most productive firms, which may be disproportionate to the marginal harms those firms' actions cause. Size-based requirements may also induce strategic responses in firms[47]; these responses should be carefully analyzed.[48]

f. Different Requirements for Different Geographic Regions

Where there are significant regional variations in benefits or costs, you should consider assessing the consequences of setting different requirements for the different regions. Assuming that all regions of the country benefit uniformly from a regulation is possibly an oversimplification, as is assuming that costs are uniformly distributed across the country.

g. Pilot Projects, Data Collection, and Learning Through Variation

If it is difficult to determine which regulatory alternative is the optimal choice, and if timing and other circumstances allow, consider analyzing the alternative of developing one or more pilot projects to test the measures under consideration. Other design alternatives that may help agencies evaluate the costs and benefits of potential regulatory measures—when feasible and appropriate—include varying geographic and temporal requirements; allowing variation in local implementation; setting thresholds to facilitate comparison of entities above and below such thresholds; and creating waiver or exemption conditions, among other options.[49]

More generally, agencies may consider the benefits and costs of regulatory alternatives that would facilitate data collection to support future analyses or retrospective review. These alternatives may be especially valuable if there are significant uncertainties about benefits or costs, or if benefits or costs may change over time. See "*Treatment of Uncertainty*" for more details on addressing uncertainty over time, including through a real options framework.

AR_003135

h. Performance Standards and Design Standards

Performance standards express requirements in terms of outcomes rather than specifying the means to those ends. When outcomes are straightforward to measure, and a reliable method to conduct such measurements will be used, performance standards may be superior to engineering or design standards, because they give the regulated parties the flexibility to achieve regulatory objectives in the most cost-effective way. As a result, performance standards are likely to allow for innovation that may ultimately result in greater net benefits than an otherwise similarly net-beneficial (in the near-term) design standard. However, you should consider not just cost savings to regulated parties stemming from the greater flexibility of performance standards, but also (1) the costs of assuring compliance for both performance standard and design standard alternatives, (2) any differences in the likely degree of compliance, and (3) the resulting effects on the net benefits of these alternatives. Because it may be less costly to ensure compliance with performance standards than with design standards in some circumstances, and the reverse in other circumstances, you should avoid relying on broad generalizations about the relative cost of ensuring compliance with these regulatory approaches; context-specific assessments of such costs will be more accurate. For more details, see the section "*Accounting for Compliance and Take-up*."

i. Market-Oriented Approaches and Direct Controls

Market-oriented approaches should be explored when permissible and appropriate. These alternatives include fees, penalties, subsidies, marketable permits or offsets, changes in liability or property rights (including policies that alter the incentives of insurers and insured parties), and required bonds, insurance, or warranties. One example of a market-oriented approach is a program that allows for averaging, banking, or trading (ABT) of credits for achieving emissions reductions or other goals. ABT programs can be extremely valuable in reducing costs for regulated firms and can achieve earlier or greater benefits than other approaches, particularly when the costs of achieving compliance vary across production lines, facilities, or firms. ABT can be allowed on a plant-wide, firm-wide, region-wide, or nation-wide basis.

Still, analysis may reveal that some ABT design options in some regulatory contexts produce distributional effects that are deemed unacceptable, as—for example—when trading across firms in different geographic locations results in locally concentrated pollution "hot spots" that degrade air quality for vulnerable populations. When assessing market-oriented approaches, you should give analytic attention to whether the behavior being penalized or rewarded is being verified (measured accurately); whether fees, credits, offsets, or other penalties or rewards lead to behavior that produces real changes in social benefits and costs compared to a realistic baseline; and whether the costs of monitoring compliance and overseeing market activities have been accounted for.

j. Informational Approaches to Regulation and Nudges

If intervention is contemplated to address a market failure that arises from asymmetric or imperfect information, or certain behavioral biases, you should consider assessing whether informational remedies or nudges (modifications of choice architecture that alter behavior) may be appropriate.

Measures to improve the availability of information include government establishment of a standardized testing and rating system (the use of which could be mandatory or voluntary), mandatory disclosure requirements (*e.g.*, advertising, labeling, or enclosures), and government provision of information (*e.g.*, government print or internet publications, telephone hotlines, or public interest broadcast announcements). To be effective, measures to improve information availability should be clear, meaningful, timely, salient, and designed to be sensitive to how people process and make choices based on that information. Improving information availability—particularly about otherwise concealed, shrouded, or non-transparent product characteristics or prices—may provide consumers or firms more choices than a mandatory product standard or ban.

Measures that serve as nudges—such as changing the default or pre-selected options, or changing the manner in which information is presented—can also improve consumer welfare without restricting choice. Such nudges can include simplifying choices through sensible default rules (such as setting automatic enrollment with opt-out versus opt-in); reducing complexity; requiring active choice; increasing the salience of certain factors or variables; and promoting desirable social norms. For the same reasons, nudges can also reduce consumer welfare, including by adopting defaults that are not sensible or by increasing complexity.

Careful analysis may help with the important task of matching underlying problems to the regulatory action that is best designed to address those problems. Informational remedies often make most sense when an underlying market failure involves an informational issue, though even in such cases, informational remedies may not necessarily be either helpful or sufficient. Similarly, nudges often make most sense when the market failure involves a behavioral bias, though—again—even in such cases, nudges may not necessarily be either appropriate or sufficient. Analytic attention may be usefully directed to assessing whether it is possible or preferable to combine informational remedies and nudges with other regulatory approaches or to apply them alone.

Specific informational measures or nudges, like other measures, should be evaluated in terms of their benefits and costs.[50] Some effects of informational measures are easily overlooked. For example, the benefits of a mandatory disclosure requirement for a consumer product potentially include not only the benefits arising from consumers' ability to make more welfare-enhancing choices, but also the benefits arising from any shifts in the composition of, and innovative additions to, products within the market (the costs of such shifts and additions should be accounted for as well). These other benefits also could include reductions in markups by increasing product comparability, or the development of products or services that meet new consumer demand resulting from the disclosure. The costs of a mandatory disclosure requirement for a consumer product will potentially include not only the cost of gathering and communicating the required information, but also the opportunity costs of the loss of any information displaced by the mandated information. Other costs also may include the effect of

[50] The section "*The Key Concepts Needed to Estimate Benefits and Costs*" discusses how willingness to pay and willingness to accept measures may need to be adjusted when analyzing informational measures or nudges that interact with behavioral biases.

AR_003137

providing information that is ignored or misinterpreted (as when a truthful disclosure causes excessive or misplaced fear), and inefficiencies arising from the incentive that mandatory disclosure may give to overinvest in a particular characteristic of a product or service.

When information on the benefits and costs of alternative informational measures or nudges is insufficient to provide a clear choice between them, you should consider the least intrusive alternative sufficient to accomplish the regulatory objective.

k. A Note Regarding Certain Types of Economic Regulation

In light of both economic theory and actual experience, it is particularly difficult to demonstrate positive net benefits for any of the following types of regulations:

- price controls in well-functioning competitive markets;
- production or sales quotas in well-functioning competitive markets;
- mandatory uniform quality standards for goods or services, if the potential problem can be adequately dealt with through voluntary standards or by disclosing information of the hazard to buyers or users; or
- controls on entry into employment or production in well-functioning competitive markets.

7. Assessing Benefits and Costs

a. Some General Considerations

The regulatory analysis should discuss the anticipated benefits and costs of the selected regulatory option and reasonable alternatives. Your approach should be transparent and consistent, and avoid double-counting. The analysis should describe how the action is expected to cause the anticipated effects.[51] It should, if feasible, report the monetized value of the anticipated benefits and costs to society. To present your results, you should:

- separately list the monetized benefits, costs, and net benefits and identify their source and timing, and include a table expressing the estimates by year in dollars that are:
  - constant (all indexed to inflation as of the same year), and
  - undiscounted (for more on discounting see the section *"Discount Rates"* below);
- when the distribution of benefits and costs[52] is analyzed, list the monetized net benefits for each subgroup, and include a table that expresses the estimates by year in undiscounted dollars;

[51] Where statistical methods are used in addressing this type of question, they should be transparent, well suited for the analysis, based on peer-reviewed methods, and applied with rigor and care. Please see the "*Quality, Objectivity, Transparency, and Reproducibility of Results*" section of this Circular, as well as standard reference texts including Jeffrey M. Wooldridge, *Econometric Analysis of Cross Section and Panel Data* (Cambridge, Mass.: MIT Press, 2010), and more recent publications: Susan Athey and Guido W. Imbens, "The State of Applied Econometrics: Causality and Policy Evaluation," *Journal of Economic Perspectives* 31, no. 2 (2017): 3-32; Clément De Chaisemartin and Xavier D'Haultfoeuille. "Two-Way Fixed Effects and Differences-in-Differences With Heterogeneous Treatment Effects: A Survey," *The Econometrics Journal* 26, no. 3 (2023): C1-C30.

[52] For additional guidance on analyzing distributional effects, see the section "*Distributional Effects*" below.

- describe the benefits and costs that you can quantify, but cannot monetize, including their timing;
- describe the benefits and costs that you cannot quantify; and
- identify or cross-reference the data or studies on which you base the benefit or cost estimates.

See the section "*Presentation of Results and Accounting Statement*" for more details on presenting the results of your analysis.

When benefit and cost estimates are uncertain (for more on this see the section *"Treatment of Uncertainty"* below), you should report estimates of effects that reflect as full a probability distribution of potential consequences as is feasible and appropriate, recognizing that some categories of benefits and costs may be unquantified. If factors such as fundamental scientific disagreement or lack of knowledge prevent construction of a scientifically defensible probability distribution, you should describe benefits or costs under plausible scenarios and characterize the evidence and assumptions underlying each of those scenarios.

Minor additional benefits or costs may not be worth further formal analysis. At the same time, the fact that benefits and costs often are uncertain, or difficult to monetize or quantify, does not necessarily make them minor, and low-probability but high-impact effects may be important to assess (whether or not those effects can be quantified or monetized). Analytic priority should be given to those additional benefits and costs that are important enough to potentially change the rank ordering of the main alternatives in the analysis.

b. The Key Concepts Needed To Estimate Benefits and Costs

"Opportunity cost" is the appropriate concept for valuing benefits and costs. There are two primary frameworks for measuring opportunity cost: "willingness to pay" (WTP) and "willingness to accept" (WTA). Both assume voluntary transactions and measure an individual's willingness to forgo an opportunity. WTP captures the notion of opportunity cost by measuring what individuals are willing to pay to obtain a particular good or service (*i.e.*, as the buyer). WTA captures the notion of opportunity cost by measuring what individuals are willing to accept to forgo a particular good or service (*i.e.*, as the seller). In other words, WTP and WTA differ in who starts with the good or service.

Under certain circumstances, WTP and WTA will produce similar estimates of opportunity cost.[53] The empirical literature is complex and evolving, but some evidence suggests that similar estimates are more likely when: prices change but quantities do not; the change being evaluated is small; there are reasonably close substitutes available; and the income/wealth effect

---

[53] In markets for fungible goods or services, observed prices often reflect both WTP and WTA simultaneously. John D. Graham, "Saving Lives Through Administrative Law and Economics," *University of Pennsylvania Law Review* 157 (2008): 427 (citing W. Michael Hanemann, "Willingness to Pay and Willingness to Accept: How Much Can They Differ?," *American Economic Review* 81, no. 3 (1991): 635). In many cases, however, there can be large differences between WTP and WTA measures. Thomas C. Brown and Robin Gregory, "Why the WTA-WTP Disparity Matters," *Ecological Economics* 28, no. 3 (1999): 323-335.

is small.[54] However, empirical evidence from experimental economics and psychology shows that even when income/wealth effects are "small," the measured differences between WTP and WTA can be large, especially in cases with uncertainty, irreversibility, and limited opportunities to learn.

In practice, the evidence available for your regulatory analysis may constrain your choice of WTP and WTA measures. As always, you should use your professional judgment to determine the most appropriate use of the available evidence. This may include using WTP or WTA data as a proxy for the other measure, in a situation in which the other measure might be preferable but is unavailable. When this is the case, you should be cognizant of—and discuss as appropriate—the potential directional errors that may result in your analysis, noting that generally the value of WTA will be greater than or equal to the value of WTP.

Market prices provide rich data for estimating benefits and costs based on WTP or WTA if the goods and services affected by the regulation are traded in well-functioning competitive markets. The opportunity cost of an alternative includes the value of the benefits forgone as a result of choosing that alternative. For instance, the opportunity cost of banning a product—for example, a consumer good, food additive, or hazardous chemical—is the forgone net benefit (including lost consumer and producer surplus[55]) of that product, taking into account the mitigating effects of potential substitutes.

The use of any resource has an opportunity cost regardless of whether the resource is already owned or has to be purchased, rented, or otherwise acquired. That opportunity cost is equal to the net benefit the resource would have provided in the next best use in the absence of the requirement. For example, if regulation of an industrial plant affects the use of additional land or buildings within the existing plant boundary, there is an opportunity cost of using the additional land or facilities. To the extent feasible, you should monetize any such forgone benefits and add them to the other costs of that alternative. You should also, to the extent feasible, monetize any cost savings as a result of an alternative and either add it to the benefits or subtract it from the costs of that alternative, in a manner reflecting the incidence of cost savings.

Estimating benefits and costs is more difficult when markets are distorted (due to market failure, failure of public institutions, or behavioral biases), market prices are difficult to measure, or markets do not exist and allocation of resources is via some other mechanism, such as household production.[56] In these cases, estimating the value of the benefit or cost that you are

---

[54] *See* W. Michael Hanemann, "Willingness to Pay and Willingness to Accept: How Much Can They Differ?," *American Economic Review* 81, no. 3 (1991): 635-647; Jinhua Zhao and Catherine L. Kling, "A New Explanation for the WTP/WTA Disparity," *Economics Letters* 73, no. 3 (2001): 293-300.
[55] Consumer surplus is the difference between what a consumer pays for a unit of a good and the maximum amount the consumer would be willing to pay for that unit, holding income and the prices of other goods constant. It is measured by the area between the price paid and the demand curve for that unit. Producer surplus is the difference between the amount a producer is paid for a unit of a good and the minimum amount the producer would accept to supply that unit. It is measured by the area between the price and the supply curve for that unit.
[56] When markets are distorted, the extent of such distortions should provide a key input in your quantification of regulatory net benefits; please see the sections "*Partial and General Equilibrium Analysis,*" "*Transfers,*" and "*Integrating Assessments of Potential Needs for Federal Regulatory Action into the Regulatory Analysis*" for related discussion.

interested in requires developing appropriate proxies.

Adoption of either WTP or WTA as the measure of value implies that individual preferences of the affected population should be a guiding principle in the regulatory analysis. However, in some cases adjustments to observed values or alternative methods of estimating values are required to obtain WTP or WTA estimates appropriate for benefit-cost analysis, such as when there are distortions caused by market failures.

An important class of cases in which the observed WTP or WTA may need to be adjusted to obtain estimates appropriate for benefit-cost analysis involves behavioral biases. A high observed WTP or WTA may reflect a truly high valuation for the underlying good or service or it may reflect a smaller WTP or WTA coupled with a bias that increases consumers' observed WTP or WTA. Similarly, a low observed WTP or WTA could reflect a higher true valuation coupled with a bias that decreases consumers' observed values. In these cases, you should endeavor to separate these two components, the true valuation and the bias, to accurately measure benefits and costs in your regulatory analysis. For example, when there is evidence that manipulative, rather than informational, aspects of advertising influence individuals' WTP or WTA, the observed or measured WTP or WTA should accordingly be adjusted.[57] Another class of cases involves situations in which the relevant population's preferences may not be appropriately measured using traditional techniques, and alternative approaches to valuation are necessary. See the section "*Benefits and Costs that Are Difficult to Quantify or Monetize*" below for more details.

As already mentioned regarding the use of market prices, estimates of WTP or WTA based on revealed preference methods can be useful (see the section "*Appropriate Use of Revealed Preference Methods, Including Direct and Indirect Uses of Market Data*" below for more discussion). As one example, analysts sometimes use "hedonic price equations" based on regression analysis of market behavior to identify the implicit prices for the attribute of interest.[58] The hedonic technique allows analysts to develop an estimate of the WTP for specific attributes associated with a product. For instance, a house is a product characterized by a variety of attributes, including the number of rooms, total floor area, type of heating and cooling, and access to environmental amenities. If there are enough data on transactions in the housing market, it is possible to develop an estimate of the implicit price for specific attributes, such as the implicit price of an additional bathroom or for central air conditioning. This technique can be extended, as well, to develop an estimate for the implicit price of public goods that property provides access to, or other goods or services that are not directly traded in markets (or, even if traded in markets, are bundled with other attributes), such as access to environmental amenities.

[57] Relatedly, if a regulation causes measured WTP for a product to rise, it could mean that the regulation reduced the source of a behavioral bias associated with that product, yielding a regulatory benefit (or, if WTP falls due to an increase in behavioral bias, yielding a regulatory cost). Conversely, if a regulation causes measured WTP for a product to fall, it could be because consumers are now accounting for what was formerly an internality, also yielding a regulatory benefit (or, again, thus indicating a cost if WTP rises because an internality was exacerbated). You should use good evidence to assess whether such the case at hand is characterized by this type of ambiguity and to augment direct WTP or WTA studies with appropriate other evidence before monetizing quantitative estimates.

[58] *See, e.g.*, Kelly C. Bishop et al., "Best Practices for Using Hedonic Property Value Models to Measure Willingness to Pay for Environmental Quality," *Review of Environmental Economics and Policy* 14, no. 2 (2020): 260-281.

An analyst can develop such implicit WTP estimates for goods or services like air quality, access to public parks, and public-school quality by assessing the effects of these goods on the housing market. However, such estimates may be incomplete (*e.g.*, if home buyers are not fully aware of the effects of the environmental amenity, and therefore housing prices do not fully reflect such effects).

Alternatively, estimates of WTP or WTA based on stated preference methods can also be useful (see the section "*Appropriate Use of Stated Preference Methods*" below for more discussion). In the example above, stated preference data could also be used to estimate WTP for a specific attribute of a house. One advantage of such techniques is that they can be used even when there is not enough data on transactions—such as if there have been insufficient housing transactions in a particular geographic area to value a local amenity through a hedonic study—to apply a revealed preference approach.

You should try to account for the shares of the same benefits and costs captured by different estimates as you refine your analysis. In other words, you need to guard against double-counting, since some benefits or costs are embedded in other broader measures. To balance this goal with concerns about under-counting meaningful effects by excluding potentially overlapping benefits or costs, it may be helpful to include a range—with the lower-bound estimate prioritizing the avoidance of double-counting and the upper-bound estimate prioritizing the avoidance of omitted categories of impacts. A primary estimate, however, should generally not be derived by averaging these bounds; see the section "*Treatment of Uncertainty*" for more details.

To illustrate potential overlaps and gaps, consider a policy that reduces air pollutants in a community. If you were to measure the public health benefits of the regulation exclusively using the change in the net present value of expected lifetime wage income of those in the community—contrary to the guidance in the section "*Monetizing Health and Safety Benefits and Costs*"—then you would have excluded benefits that accrue to those who do not earn wage incomes, health benefits reflected incompletely (or not at all) in lifetime wages, aesthetic value, etc. Even if you develop a complete measure of the public health benefits of the regulation, note that the air pollutant regulation may also improve the quality of the environment in a community, and the value of real estate in the community will generally rise to reflect the greater attractiveness of living in a better environment. However, simply adding the increase in property values to the estimated value of improved public health would be double counting if the increase in property values fully or partly reflects the improvement in public health. To avoid this problem, you should try to separate the embedded effects on the value of property arising from improved public health. At the same time, an analysis that fails to incorporate the change in value caused by any land use changes will not capture the full effects of regulation.

c. Appropriate Use of Revealed Preference Methods, Including Direct and Indirect Uses of Market Data

Revealed preference methods develop estimates of the value of goods or services—or

AR_003142

attributes of those goods or services—based on observable tradeoffs that people actually make.[59] These methods are well grounded in economic theory. When designing or evaluating a revealed preference study, the following principles should be considered:

- consistency of the results with up-to-date economic theory and the best available economic science;
- validity of the research design and framework for analysis;
- if the market is not efficient, identification of the relevant market failure, failure of public institutions, or behavioral bias (and, as feasible, adjustments such that the resulting WTP/WTA estimates reflect the social value of the benefits and costs)[60];
- the representativeness of the specific market participants being studied relative to the population that will likely be affected by the regulation under consideration; and
- the appropriateness of the theoretical, statistical, and econometric models employed, the potential for explicit identification of key parameters, and the robustness of the resulting estimates in response to plausible changes in model specification and estimation technique.[61]

You should try to determine whether there are multiple revealed-preference studies of the same good or service and whether anything can be learned by comparing the methods, data, and findings from different studies or by synthesizing them in a meta-analysis. Professional judgment is required to determine the appropriate use of each available study. You should analyze the available evidence and related literature to determine the quality of studies in your analysis and the weight you give them in your analysis, if any, and discuss any relevant limitations of such studies.

Economists ordinarily consider market prices as the most accurate measure of the marginal value of goods and services to society. This is most likely to be the case for goods and services exchanged in competitive markets with no externalities or other market failure. When goods or services are not exchanged in well-functioning markets or there are spillover benefits or costs, then market prices generally do not reflect the marginal social value of goods and services. Goods whose market prices may not reflect their social value include those whose production or consumption results in substantial positive or negative external effects, other distortions, etc. For example, the observed consumer price of gasoline does not necessarily reflect the marginal social value of a gallon of gasoline because of taxes, other government interventions, and negative externalities (*e.g.*, the impacts of pollution on the local environment and global climate change).

If a regulation involves a market where the price does not reflect the value to society, you should try to identify and estimate the additional benefits and costs external to the market that result from changes in the quantity of goods and services in the market in your analysis. For

Addicott et al., “Toward an Improved Understanding of Causation in the Ecological Sciences,” *Frontiers in Ecology and the Environment* 20, no. 8 (2022): 474-480.

AR_003143

example, suppose damage to pollinator habitat reduces crop yields. One of the benefits of controlling the loss of pollinator habitat is the value of the crop yield maintained or increased as a result of the controls. That value is typically measured by the price of the crop. However, if a government program has distorted the agricultural market and increased the crop's price above what it would otherwise be, then the change in crops valued at the prevailing price may overstate the value of the additional yield that results from controlling habitat loss. In this case, some adjustment of the value implied by the market data on price alone may more appropriately reflect the net social effects of the increased crop yield and, hence, the associated value of protecting against the loss of pollinator habitat.

Many goods or attributes of goods that are affected by regulation—such as many environmental or cultural amenities—are not traded directly in markets. The value of these goods or attributes arises from use and non-use. When feasible, these values should be included in your estimates of benefits and costs. Estimation of these values is challenging relative to observing prices in markets, though techniques for estimating implicit prices that are not observed in markets are well developed.

"Use values" arise when an individual derives satisfaction from using a resource irrespective of whether the resource is consumed or degraded in the process. Some use values are exclusionary and directly alter ownership of a good, such as mineral extraction and sale. In other cases, the marginal use is less excludable, and each additional user may reduce the value of the resource to each other user as crowding occurs (*i.e.*, use is rivalrous), as is the case for fisheries. At times, exclusive and non-exclusive uses are incompatible. Importantly, non-exclusionary use values can be passive (*i.e.*, non-consumptive).

One example of such passive use values is storage of future opportunities, *e.g.*, holding minerals in the ground to hedge against price risk or holding fossil fuels in the ground to avoid the need for additional expenditures on greenhouse gas abatement. Holding the opportunity or option—the possibility, but not the obligation—to use the resource in the future is a type of use value (often called option value). One way to account for passive use values is to think of them as valuable "real options" (see "*Treatment of Uncertainty*" below for more details on real options).

Another example is storm protection generated by natural infrastructure. Undeveloped sand dunes, mangrove forests, or coastal wetlands help manage flooding risks to homes without the homeowners acting. In such cases, a minimum value (though not the total value) of these ecosystem services is revealed by homeowners' choice not to interfere with existing natural infrastructure or nature-based solutions.[62] Indeed, in many relevant economic cases, doing nothing can be the "action" that generates the greatest welfare.[63]

---

Fenichel, "Valuing Natural Capital When Management Is Dominated by Periods of Inaction," *American Journal of Agricultural Economics* 104, no. 2 (2022): 791-811.

"Non-use values" arise when an individual places value on a resource, good, or service even though the individual will not use the resource, now or in the future. Non-use value includes bequest and existence values. That is, individuals might value the ability to pass a resource on to another person, or value the existence of a resource (such as a pristine area or an endangered species) independent of any use of it. You should endeavor to give due weight to the tradeoffs people make and preferences people have with respect to such non-use values.[64] Techniques consistent with the best available economic science enabling estimates of these non-use values should be employed when appropriate and feasible.[65]

Preferences regarding the welfare of others is a closely related concept but may not be strictly considered a "non-use" value.[66] A pure concern for the welfare of all others, as measured by others' WTP for or WTA regulatory effects, supplements both benefits and costs (when appropriately weighted) proportionally, and therefore does not have an effect on rank ordering of the net benefits of different policy alternatives; in such cases, it is not necessary to measure the amount of such general altruism in regulatory analysis. If other-regarding preferences instead vary with the benefit or cost (*e.g.*, is greater for health benefits or costs than for other benefits or costs) or depend on the individuals affected, then they can affect the rank ordering of the net benefits of different policy alternatives.[67]

Some goods and services are indirectly valued in markets, which means that their value is reflected in the prices of related goods and services that are directly traded in markets. Their use values are typically estimated through revealed preference methods. Examples include estimates of the values of environmental amenities derived from recreation demand studies, the cost of defensive expenditures taken to avoid a negative health outcome, and hedonic price models that measure differences or changes in the value of real estate. You should take particular care when developing a revealed preference model that you are designing protocols for reliably estimating the values of these attributes.

d. Appropriate Use of Stated Preference Methods

Stated preference methods (SPM) have been developed and used in the peer-reviewed literature to estimate use and non-use values of goods and services in many contexts. They also have been widely used in regulatory analyses by Federal agencies, in part because these methods can be employed to address a wide variety of goods and services that are not easy to study through revealed preference methods.

The distinguishing feature of these methods is that hypothetical questions about use or non-use values are posed to survey respondents in order to obtain WTP or WTA estimates relevant to benefit or cost estimation. Some examples of SPM include contingent valuation,

Hammitt, "Behavioral Economics and the Conduct of Benefit-Cost Analysis: Towards Principles and Standards," *Journal of Benefit-Cost Analysis* 2, no. 2 (2011): 25-28; Theodore C. Bergstrom, "Benefit-Cost in a Benevolent Society," *American Economic Review* 96, no. 1 (2006): 339.

attribute-based methods (sometimes called choice experiments), and risk-tradeoff analysis. The surveys used to obtain the health-utility values used in cost-effectiveness analysis are similar to stated-preference surveys but do not entail monetary measurement of value. The principles governing quality stated-preference research, with some obvious exceptions involving monetization, are also relevant in designing quality health-utility research.

When you are evaluating a stated-preference study, the following principles should be considered, including whether the study[68]:

- Explained the good or service being evaluated to the respondent in a clear, complete, and objective fashion, with a clear baseline or status quo scenario.
- Provided evidence that respondents understand, accept, and view the information presented in the scenarios as credible.
- Developed the survey instrument based on formative work, including focus groups and pre-testing, and documented such formative work.
- Designed WTP or WTA questions to relate to how respondents see the good or service, focusing them on the reality of budgetary limitations, and alerting them to the availability of substitute goods or services and alternative expenditure options.
- Had experimental designs that yield efficient and unbiased estimates of preference parameters. Ideally, designs should allow for interactions among attributes.
- Ensured questions are incentive compatible, randomized question order across respondents, and used a decision rule and payment vehicle that is realistic and binding. For public goods, referendum formats should be considered, but are not always the right choice. It is important that analysts attempt to account for any strong preferences that respondents may have concerning the payment vehicle itself (*e.g.*, a tax payment vehicle).
- Designed the survey instrument to probe beyond general attitudes (*e.g.*, a "warm glow" effect for a particular use or non-use value) and focus on the magnitude of the respondent's economic valuation.
- Included auxiliary questions to enhance validity.
- Ensured that the analytic results are consistent with economic theory using "internal" (within respondent) and "external" (among respondents) scope tests, such that the willingness to pay is larger (or smaller) when more (or less) of a good is provided (absent confounding influences).
- Selected/sampled the subjects being interviewed in a statistically appropriate manner, had a sample frame adequately covering the target population, and had a sample drawn using probability methods from a known sampling frame in order to generalize the results to the target population.
- Had response rates that are as high as reasonably possible, that is, followed best survey practices to achieve high response rates. Low response rates increase the potential for statistical bias and raise concerns about the generalizability of the results. If response rates are not adequate, you should consider conducting an analysis of non-response bias or further studies. Caution should be used in assessing the representativeness of the sample based solely on demographic profiles. Statistical adjustments to reduce non-

[68] Robert J. Johnston et al., "Contemporary Guidance for Stated Preference Studies," *Journal of the Association of Environmental and Resource Economists* 4, no. 2 (2017): 319-405.

response bias should be undertaken whenever feasible and appropriate.

- Had a mode of administration of surveys (in-person, phone, mail, internet, or multiple modes) that was appropriate in light of the nature of the questions being posed to respondents and the length and complexity of the instrument.
- Provided documentation about the target population, the sampling frame used and its coverage of the target population, respondent recruitment method, the design of the sample (including any stratification or clustering), the cumulative response rate (including response rate at each stage of selection if applicable), the item non-response rate for critical questions, the exact wording and sequence of questions and other information provided to respondents, and the training of interviewers and techniques they employed (as appropriate).
- Used statistical and econometric methods to analyze the collected data that are transparent, well suited for the analysis, based on peer-reviewed methods, and applied with rigor and care.
- Addressed observed and unobserved preference heterogeneity.
- Used methods of computing WTP or WTA that are transparent, consistent with theory, and provide an estimated central tendency and dispersion.
- Included an internal validity assessment in stated preference and stated behavior assessments, with formally constructed validity tests and assessment of content validity.

Professional judgment is necessary to apply these criteria to one or more studies, and thus there is no mechanical formula that can be used to determine the appropriate use of any given study in regulatory analysis. You should analyze the available evidence and related literature to determine the quality of studies in your analysis as well as the weight you give them in your analysis. You should also discuss any relevant limitations of such studies.

Since SPM generate data from respondents in a hypothetical setting, sometimes on complex and unfamiliar goods, special care is needed in the design and execution of surveys, analysis of the results, and characterization of the uncertainties. Examples exist that illustrate these challenges being overcome.[69] A stated-preference study may be the only way to obtain quantitative information about non-use values, though—as is the case more generally—a number based on a poor-quality study is not necessarily superior to a qualitative analysis of the non-use value. Non-use values that are not quantified should be discussed qualitatively.

A single study can use a mix of revealed and stated preference information. Augmenting revealed preference data with stated preference data can help reduce biases that stem from unobservable features of the respondents, extend estimates beyond range of observed variability, or offer greater confidence in stated preference information.

In some cases, either revealed-preference or stated-preference studies will not be directly applicable to the regulatory analysis; for example, certain revealed-preference studies may not capture non-use values relevant to a regulatory analysis. If both revealed-preference and stated-preference studies that are directly applicable to regulatory analysis are available, you should

---

[69] *See, e.g.*, Richard C. Bishop et al., 2017. "Putting a Value on Injuries to Natural Assets: The BP Oil Spill," *Science* 356, no. 6335 (2017): 253-254.

consider both kinds of evidence and compare or combine[70] the findings when feasible. If the results diverge significantly, you should, when feasible, compare the overall quality of the two bodies of evidence.

Other things equal, revealed preference data are preferable to stated preference data because revealed preference data are based on actual decisions, where market participants enjoy or suffer the consequences of their decisions. This is not generally the case for respondents in non-consequential stated preference surveys, who may not have similar incentives to offer thoughtful responses that are consistent with their preferences or may be likely to bias their responses. However, it is generally appropriate to—all else equal—give less credence to a lower-quality revealed preference study than a higher-quality stated-preference study (*e.g.*, when a stated preference study is better targeted at valuing the particular good being analyzed than a revealed preference study). Consultation with OMB is advisable, prior to initiating a regulatory analysis, for further guidance on selecting between or combining revealed preference and stated preference studies.

e. Benefit Transfer Methods

It is often helpful to collect timely, case-specific data on revealed preference or stated preference values to support regulatory analysis. Yet conducting an original study may not be feasible due to the time and expense involved, or such a study may not be able to produce evidence that yields sufficient additional insight. One alternative to conducting an original study is the use of "benefit transfer" methods. (Such transfer methods may be applied to cost estimates as well.) The practice of "benefit transfer" begins with transferring existing estimates or functions obtained from indirect market, other revealed preference, and stated preference studies to new contexts (*e.g.*, the context posed by the regulation). The principles that guide transferring estimates from indirect market, other revealed preference, and stated preference studies should apply to direct market studies as well.

Benefit transfer can provide a lower-cost, readily implementable approach for obtaining desired monetary values for regulatory analysis. However, transferring estimates or functions from one context to another requires attending to external validity, and may create additional uncertainties of unknown magnitude. Nonetheless, benefit transfer methods are appropriate when more direct and specific valuations are unavailable or inferior, or when time, resources, or other constraints do not permit conducting studies specific to the regulatory context.

In conducting benefit transfer, the first step is to describe the regulatory alternative and identify potential sources of information for the regulatory analysis. You should identify the relevant measure of the policy change at this initial stage. For instance, you can derive the relevant willingness to pay measure by specifying an indirect utility function. This identification

[70] Tools such as systematic review, meta-analysis, and expert elicitation may enable combination across studies or data sources. *See* Lisa A. Robinson and James K. Hammitt, "Introduction to the Special Series on Research Synthesis: A Cross-Disciplinary Approach," *Risk Analysis* 35, no. 6 (2015): 963-970.

allows you to "zero in" on key aspects of the benefit transfer.[71]

The next step is to identify appropriate studies that provide the basis for the benefit transfer. In selecting transfer studies for either value transfers or function transfers, you should consider the following criteria, as feasible and appropriate[72]:

- The selected studies are based on adequate data, and on sound and defensible empirical methods and techniques.
- The selected studies document parameter estimates of the valuation function.
- The existing study's context and the new policy context have similar populations (*e.g.*, demographic characteristics). For example, a study valuing water quality improvement in one locality may not necessarily be a suitable proxy for valuing a policy that will affect water quality throughout the United States if the affected populations are different in relevant ways.
- The good or service, and the magnitude of change in that good or service, are similar in the study and policy contexts.
- The relevant characteristics of the study and the policy contexts are similar. For example, the effects examined in the original study should be "reversible" or "irreversible" to a degree that is similar to the regulatory actions under consideration.
- The distribution of property rights is similar so that the analysis uses the same welfare measure. If the property rights in the study context support the use of WTA measures while the rights in the regulatory context support the use of WTP measures, use of that study when conducting benefit transfer may not be appropriate.
- The availability of substitutes across study and policy contexts are similar.

If you can choose between transferring a function or a point estimate, transferring the entire function (referred to as benefit function transfer) is generally preferable to adopting a single point estimate (referred to as benefit point transfer).[73] At times, it may be appropriate to transfer some parameters that are inputs to a transfer function, while estimating other parameters

[71] Sapna Kaul et al., "What Can We Learn from Benefit Transfer Errors? Evidence from 20 Years of Research on Convergent Validity," *Journal of Environmental Economics and Management* 66, no. 1 (2013): 90-104; Kevin J. Boyle et al., "The Benefit-Transfer Challenges," *Annual Review of Resource Economics* 2, no. 1 (2010): 161-182; Randall S. Rosenberger and John B. Loomis, "Benefit Transfer," in *A Primer on Nonmarket Valuation*, ed. Patricia A. Champ, Kevin J. Boyle, and Thomas C. Brown (New York: Springer Science & Business Media, 2003), 445-482; Robert J. Johnston et al., eds., *Benefit Transfer of Environmental and Resource Values: A Guide for Researchers and Practitioners* (Springer Dordrecht, 2015), 14; Robert J. Johnston et al., "Guidance to Enhance the Validity and Credibility of Environmental Benefit Transfers," *Environmental and Resource Economics* 79, no. 3 (2021): 575-624.

[73] *See* John B. Loomis, "The Evolution of a More Rigorous Approach to Benefit Transfer: Benefit Function Transfer," *Water Resources Research* 28, no. 3 (1992): 701-705; Stephanie Kirchoff, Bonnie G. Colby, and Jeffrey T. LaFrance, "Evaluating the Performance of Benefit Transfer: An Empirical Inquiry," *Journal of Environmental Economics and Management* 33, no. 1 (1997): 75-93. Transfer of point estimates are most likely to be appropriate when the study and policy contexts are very similar. Robert J. Johnston et al., "Guidance to Enhance the Validity and Credibility of Environmental Benefit Transfers," *Environmental and Resource Economics* 79, no. 3 (2021): 575-624.

for the specific case.[74]

Finally, it is generally advisable not to use a study to conduct benefit transfer in estimating benefits or costs when doing so would lack external validity, as may be the case in the following circumstances:

- The study involves small, marginal changes, while the policy context involves much larger changes, or vice versa.
- There are significant problems with applying an *ex ante* valuation estimate to an *ex post* policy context. If a policy yields a significant change in the attributes of the good, it is usually inappropriate to use the study estimates to value the change using a benefit transfer approach.
- Differences in context prevent the study from illuminating the context at hand. This may be especially relevant for studies or regulations that concern natural resources with unique attributes. For example, if a study values visibility improvements at the Grand Canyon, these results should not be used to value visibility improvements in urban areas, and vice versa.

You should attempt to satisfy as many of these criteria as possible when choosing studies from the existing economic literature. Professional judgment is required in determining whether a particular transfer is too speculative to use in regulatory analysis.

f. Valuation for Use in Multiple Analyses

When the same outcome is caused by many regulations, monetary valuations can sometimes be developed once and used across regulatory analyses. Various estimates of benefits per ton of emissions reductions or costs of labeling changes are examples of such valuations that are used across many regulations. Developing a valuation in this manner promotes consistency across regulatory contexts and reduces agencies' costs—as developing valuations can be an expensive and time-consuming endeavor—and can be beneficial when appropriate. However, you should consider the degree of similarity of outcomes and whether the use of common valuation is useful in your particular context. For example, emissions reductions in different locations may affect different numbers of people, or affect those exposed to the emissions differently. If you intend to develop a valuation that would be relevant for regulatory analyses conducted by multiple agencies, you should consult with OMB prior to beginning the work, to learn whether other agencies have data, tools, or estimates relevant to the valuation, or are interested in collaboration.

g. Additional Benefits and Costs

Your analysis should look beyond the obvious benefits and costs of your regulation and consider any important additional benefits or costs, when feasible. An additional benefit may be

[74] When a large number of potential study sites are available, a meta-analysis could be constructed for the purpose of benefit transfer. Jon P. Nelson, "Meta-Analysis: Statistical Methods," in *Benefit Transfer of Environmental and Resource Values: A Guide for Researchers and Practitioners*, eds. Robert J. Johnston et al. (Springer Dordrecht, 2015), 329-356.

a favorable impact (financial, health, safety, environmental, or other consequence) of the regulation that is unrelated to the main purpose of the regulation (*e.g.*, reduced refinery emissions due to more stringent fuel economy standards for light trucks), while an additional cost may be an adverse impact (financial, health, safety, environmental, or other negative consequence) that occurs due to a regulation and is not already accounted for in the obvious costs of the regulation. These sorts of effects sometimes are referred to by other names: for example, indirect or ancillary benefits and costs, co-benefits, or countervailing risks.

It is often helpful to begin by listing the possible additional benefits and costs. In exactly the same manner as is the case for direct benefits and costs, additional effects that are important enough to potentially change the rank ordering of the main alternatives in the analysis should be given analytic priority.[75] In some cases, directing attention to these effects may help in the generation of a superior regulatory alternative with greater additional benefits and reduced additional costs.[76]

For some regulations, costs are associated with activity that does not itself yield benefits, but instead may prompt intermediate actions that connect those effects with ultimate beneficial outcomes. For instance, a regulation may require collection and dissemination of information related to safety practices; the information itself does not make anyone safer, but its greater availability may prompt more widespread use of effective safety practices.[77] You should avoid the inappropriate omission of the costs of these activities (such as more widespread safety practices, in the example above) when indicating, quantitatively or qualitatively, that there will ultimately be beneficial outcomes resulting from such regulation.

Like other benefits and costs, an effort should be made to quantify and monetize additional effects when feasible and appropriate. If monetization is not feasible, quantification should be attempted through use of informative physical (or other quantitative) units. If monetization and quantification are not feasible, then these issues should be presented as unquantified benefits and costs. The same standards of information and analysis quality that apply to any obvious benefits and costs should be applied to additional benefits and costs.

h. Partial and General Equilibrium Analysis

i. Partial and General Equilibrium Modeling Methods Generally

Partial equilibrium economic analysis considers a single market or several related markets in isolation from the rest of the economy, that is, not modeling feedback effects from the

75 See the section "*Some General Considerations*" above.

76 Exploring the data and methods associated with an effect that seems additional may reveal an evidence base that is at least as extensive, or chains of cause and effect at least as integrated with outcomes attributable to the regulation, as those effects that are ostensibly more direct.

77 As another example, a new regulation may clarify existing regulatory requirements. This clarification may increase compliance, increasing both regulatory costs and benefits. Please see the "*Accounting for Compliance and Take-up*" section for more guidance relevant to such issues. (Evidence may indicate positive WTP or WTA associated with information even when it does not change targeted behavior; informed people may feel more confident in their decisions, may find other applications for the information, or may value the information for other reasons.)

rest of the economy. For example, a partial equilibrium analysis of a regulation that impacts production of a crop may look only at the market for that crop or related markets (*e.g.*, markets for fertilizer or complimentary and substitute goods). General equilibrium economic analysis considers all markets jointly. A general equilibrium analysis of the same crop regulation might look at how the regulation affects the economy at large, including the market for the crop, the markets for other related crops, the markets for relevant agricultural inputs, and interactions with all other relevant markets in the economy and pre-existing policies. In practice, benefit-cost analyses may combine elements of a partial equilibrium analysis and elements of a general equilibrium analysis.[78]

Partial equilibrium analysis is most useful when the effects of a regulation are likely to occur mostly within the modeled sector(s) of the economy and are unlikely to interact with pre-existing distortions in other markets not modeled. An implicit assumption of this approach is that effects that occur in other markets are either fully captured in the analysis of the directly affected markets or are small. For example, if a regulation affecting a particular crop causes farmers to reduce the acreage devoted to that crop and increase the acreage devoted to another, but there are no price effects in the market for the alternative crop, a partial equilibrium analysis examining the decline in the acreage devoted to the first affected crop may fully capture the relevant effects. Similarly, if the regulation reduces acreage devoted to the affected crop but does not cause any changes in non-agricultural production decisions, a partial equilibrium analysis that captures all agricultural markets may be sufficient.[79] Partial equilibrium analysis may also be particularly useful when significant sectoral resolution is required to accurately model the behavioral response to, and thus the benefits and costs of, a regulation. Such resolution may be able to be achieved in a partial equilibrium model, but such resolution may not be possible in a general equilibrium model (*e.g.*, due to computational limitations).

General equilibrium analysis is most useful when a regulation affects many markets simultaneously or the effects in one market have important spillovers into many other markets, interact with pre-existing distortions or policies, or lead to behavioral shifts related to non-market allocation mechanisms. For example, if a safety regulation increases the cost of a good and causes buyers to substitute other goods and, in addition, the increased demand for those other goods leads to higher prices for those goods that further affect purchasing decisions, a general equilibrium analysis may be necessary to capture the full range of effects. General equilibrium analysis is also useful in instances when a regulation is likely to have important impacts on macroeconomic aggregates (*e.g.*, GDP or employment), with important feedback effects across the economy.[80] In determining the appropriate analytic approach, the nature and extent of relationships between the effects in different markets is more important than the size of the

[78] A commonality across equilibrium concepts is that they are often associated with a time span that is sufficient for a new steady state to be reached in the market(s) affected by the regulatory intervention being assessed. Such considerations are likely to be important when selecting a time horizon for your regulatory analysis.

[79] When using partial equilibrium analysis, it is important to identify potential offsetting effects that could occur outside of the market or geographic area covered by the analysis. For example, an analysis may indicate that there are net benefits within a particular region, but if those net benefits result, in part, because costs would be borne in another region, the preliminary analysis could be misleading. Refinement might take the form of expanding to multi-market analysis or revising the single-market analysis to define the market to encompass a wider geographic range.

[80] Regarding the effects of recessions and recoveries on regulatory benefits and costs, see the section "*Accounting for Business Cycle Dynamics*" for more details.

markets, though regulations affecting a larger market may also be more likely to have important effects in other markets.

There are many circumstances in which general equilibrium analysis, or partial equilibrium analysis extending beyond direct impacts to secondarily affected markets, may be particularly useful. As suggested in the examples above, one such circumstance is when a regulation causes substantial price changes in markets other than the directly affected market or noteworthy reallocation of time or services not allocated through markets. However, the appropriate mode of analysis in a specific regulatory context is necessarily a question that requires professional judgment. When the differences in estimates of benefits and costs between a partial equilibrium analysis and a general equilibrium analysis are unlikely to be substantial, it will often be the case that it is more useful to improve and refine a partial equilibrium analysis than to develop a general equilibrium analysis.

Both partial equilibrium and general equilibrium analytic approaches can be appropriate in a regulatory analysis.[81] The choice between the two may depend on the nature of the regulation under consideration, the anticipated effects of the regulation, the available data and evidence for use in the analysis, and the feasibility of the different approaches. You may also combine aspects of the two approaches, such as by conducting a partial equilibrium analysis of several markets or conducting a quantitative partial equilibrium analysis supplemented by a qualitative general equilibrium analysis.[82] Integrating a partial or general equilibrium model with either other economic models or physical system models (such as an atmospheric model) can also provide further insights into regulatory benefits and costs.

ii. Considerations When Conducting General Equilibrium Analysis

As with the use of any other methodological approach, analysts conducting a general equilibrium analysis will need to make a variety of assumptions. Consistent with the general guidance of this Circular, analysts should take care to detail and explain the assumptions they make when conducting a general equilibrium analysis. Two general equilibrium-specific situations requiring guidance are discussed next; however, other assumptions may also need to be addressed.

First, general equilibrium modeling often imposes budget constraints on each household, firm, or government in the model. A household budget constraint may, for example, limit household spending to the sum of income and borrowing. However, the development of an

[81] However, input-output models, such as the Bureau of Economic Analysis's RIMS II model, are not generally appropriate as the primary basis for assessing the benefits and costs of regulatory actions. Input-output models quantitatively assess the interdependencies between different sectors in an economy. Input-output models generally do not account for any feedback effects, including general equilibrium macroeconomic feedback effects that depend on the current state of the business cycle, and often produce measures such as changes in output or wages which should not be conflated with estimates of benefits. See the section "*Accounting for Business Cycle Dynamics*" for more details. Input-output models may still be a useful part of an analysis (*e.g.*, establishing baseline conditions), even when not appropriate as a primary basis for assessing the benefits and costs of regulatory actions.
[82] For an example of qualitative general equilibrium analysis being used in a policy-relevant fashion, *see* J. Peter Neary, "Intersectoral Capital Mobility, Wage Stickiness, and the Case for Adjustment Assistance," in *Import Competition and Response*, ed. Jagdish N. Bhagwati (Chicago: University of Chicago Press, 1982), 39-71.

appropriate Federal government budget constraint for use in regulatory analysis is challenging because typical implementations of such constraints assume Federal policy changes that are not part of the regulation under consideration. For example, a regulation that has the effect of discouraging production may reduce the quantity of labor supplied and reduce income tax revenues. A general equilibrium model may assume that the reduction in income tax revenues is offset by a reduction in transfer payments, but such a reduction in transfer payments is not part of the regulation. Assumptions about the policies the government will use to balance the budget in these models are sometimes known as fiscal closure rules. You should take care to ensure that such rules do not inappropriately affect the results of your analysis.

In estimating the net benefits of a regulation, it is generally important to account for relevant government transfer effects. For example, an analysis of a regulation that increases payments to recipients of a public benefits program needs to reflect the budgetary cost of those payments to ensure that net benefit estimates are not overstated.[83] Fiscal closure rules are a common means of accounting for these transfer effects in general equilibrium modeling, but fiscal closure rules are hypothetical because they assume policy changes that are not part of the regulation. Application of fiscal closure rules can thus make the results of a regulatory analysis sensitive to these assumptions about hypothetical policy. Special attention should be paid to the development and presentation of your estimates to appropriately reflect this sensitivity.

In general, you may consider using adjustments in lump-sum transfers from households to balance net government transfers. This approach can be straightforward and tractable to implement analytically, and in certain models it can be used to transparently present the role of such transfers. When behavioral responses to a private-sector mandate or other similar regulation cause material increases or decreases in Federal deficits, you may present results that isolate the role of these behavioral effects on Federal deficits, and you may present estimates of the net benefits including and excluding these effects. This range illustrates the sensitivity of the results to assumptions about the fiscal closure rule and can be used in place of an analysis using alternative fiscal closure rules.

More generally, you should take care to ensure that your results are minimally affected by any policy changes that are not part of the regulation of interest, and you should not include in your primary estimates effects that depend on future Federal legislation or regulation. For example, if you use lump-sum transfers to close a fiscal shortfall in your general equilibrium analysis, the corresponding distributional analysis should report the effects on people excluding the effect of these lump-sum transfers, accompanied by an estimate of the net effect on the Federal budget absent the lump-sum transfer. This approach allows for presentation of the direct distributional consequences of the regulation.

Second, in all modeling the analyst must decide what parameters are chosen outside the

---

[83] All else being equal, a one-dollar increase in benefit payments would be offset by a one-dollar cost to the Federal government and have no net benefits. All else is not always equal; for example, in a recession, such government outlays may have benefits that exceed the size of the outlay. These are often referred to as "multiplier effects." See the section "*Accounting for Business Cycle Dynamics*" for more discussion. And as noted in the section "*Transfers*," transfers may also have important distributional effects and effects on incentives and behavior that should be captured in your analysis, and may affect the net benefits of the outlay.

model and what parameters are determined within the model. Many parameters chosen outside the model in partial equilibrium analysis may be determined within the model in general equilibrium analysis. This is often viewed as a strength of general equilibrium analysis. Therefore, it may be appropriate to use a general equilibrium model that would imply parameter values different from those recommended elsewhere in this Circular. One example of this issue is the case of a general equilibrium model in which the model specification—resulting from analysis-specific considerations—implies a discount rate schedule differing from the default values recommended in this Circular. See the section "*Discount Rates*" for more discussion. In these cases, you should take care in how you combine elements of your analysis that rely on different implicit assumptions. You should take similar care when elements of general equilibrium analyses are combined with partial equilibrium analyses. There may also be other endogenously determined parameters in general equilibrium analyses. The discount rate is merely an example, and similar principles apply to other such cases.

i. Methods for Treating Non-Monetized Benefits and Costs

Sound quantitative estimates of benefits and costs, where feasible, are preferable to qualitative descriptions of benefits and costs, because quantitative estimates succinctly summarize the magnitudes of the effects of alternative actions. However, some important benefits and costs may be either difficult to quantify or difficult to monetize. When you determine that it is not possible or appropriate, given the state of the evidence, to quantify or monetize certain effects, you should carefully identify and assess the non-monetized and unquantified benefits and costs.

When it is not possible to quantify or monetize all of the important benefits and costs of a regulation, the policy that most enhances social welfare will not necessarily be the one with the largest quantified and monetized net-benefit estimate. In such cases, you should present the evidence available in a manner that will allow policymakers and the public to determine how important the unquantified benefits or costs may be in the context of the overall analysis. This section discusses how such benefits and costs can be considered.

i. Benefits and Costs that Are Difficult to Quantify or Monetize

Possible reasons that a benefit or cost may be difficult to quantify or monetize include, but are not limited to:

- The social value of a benefit or cost cannot be appropriately measured through individual choice.[84] For example, it would not be appropriate to attempt to fully measure the value of human dignity, civil rights and liberties, equity, justice, or indigenous cultures through individual choice as measured by WTP or WTA. It is possible to conceptualize a WTP or WTA for certain such impacts, but because such impacts may have value over and above their welfare value, attempting to monetize such impacts will—in many cases—misrepresent their full social value.
- The value of a benefit or cost cannot be measured through individual choice, because

[84] See related discussion in Daniel Acland, "What's in, What's out? Towards a Rigorous Definition of the Boundaries of Benefit-Cost Analysis," *Economics & Philosophy* 38, no. 1 (2022): 34-50.

traditional WTP or WTA measures are predicated on assumptions about behavior, decision-making, or appropriate valuation that do not apply. For a regulation that affects the safety of young children, for example, it is possible to use market transactions or survey evidence to estimate the WTP or WTA of others (such as parents) but generally not of the children themselves; for that reason, traditional WTP or WTA measures may yield incomplete estimates.

- The approach to measurement is conceptually clear, but difficulty in collecting the relevant data or conducting the relevant experiment prevents measurement. For example, science might not have progressed to the point where it is possible to quantify the harm done by some pollutant, or technical analysis might not enable an agency to quantify the benefits of some measure designed to reduce safety risks on the highways, or of some measure designed to reduce the importation of contraband. Alternatively, or in addition, directly measuring the valuation of the avoidance of some harm may be inconsistent with research ethics and a relevant quasi- or natural experiment may not be apparent.
- The data exist and the proper method of measurement is clear, but expenditure of the time or resources needed to measure the benefit or cost in the specific regulatory context would be unreasonable.

These reasons why benefits or costs may be difficult or inappropriate to quantify or monetize are merely examples and are by no means exhaustive.

When you are unable to quantify or monetize important benefits or costs due to difficulty in collecting data or time and resource constraints, it is helpful to outline the data collection or analysis that would enable quantification or monetization, even if doing such data collection or analysis is currently infeasible. Doing so may encourage research that would allow for such effects to be quantified or monetized in future regulations.

Benefits and costs that are difficult to quantify or monetize differ from those that are uncertain (although an effect of a regulation can be both difficult to quantify or monetize and also uncertain). Uncertain effects are those that may or may not come to pass or that have uncertain magnitudes, but where some aspects of the underlying probability of occurring or of potential outcomes are known. It is important that your analysis, to the extent feasible, account for both effects that are difficult to quantify or monetize (whether or not they are especially uncertain) and those that are uncertain (whether or not they are difficult to quantify or monetize). See the section "*Quantitative Analysis of Uncertainty*" for details on how to quantify or monetize uncertain effects, where doing so is possible.

ii. Accounting for Benefits and Costs that Are Difficult to Quantify or Monetize

If you are not able to quantify certain effects of a regulation, you should present any relevant information that would inform an understanding of those effects (including their magnitude and probability) along with a description of the unquantified effects, such as (in the context of assessing a regulation that affects the environment) ecological gains or ecosystem services, improvements in quality of life, viewshed improvement, and indigenous culture preservation. You should generally discuss the strengths and limitations of the qualitative information. The discussion should include the reason(s) why the relevant benefits and costs are not quantified.

Even when it is possible to quantify certain effects of a regulation, it might not be possible or sensible to express those effects in monetized terms. In such cases, you should generally explain why this is the case and present all available quantitative information. For example, if you can quantify but cannot monetize improvements in water quality and fish populations resulting from water quality regulation, you can describe recreation benefits in terms of changes in visitation to recreational fishing areas or changes in recreational fish landings. You should endeavor to describe the timing and probability of such effects and avoid double-counting of benefits when estimates of monetized and non-monetized effects are mixed in the same analysis. Similarly, it is important to endeavor to avoid double-counting costs. You should, when feasible and appropriate, accompany this quantitative information with qualitative categorization and discussion of the likely welfare effects (benefits or costs) of the quantified changes.

For cases in which the unquantified or non-monetized benefits or costs could be meaningful in informing a policy choice, it is important, when feasible, to provide detailed information on the nature, timing, probability, location, and distribution of the unquantified or non-monetized benefits or costs.[85] In addition to a detailed description of the meaningful unquantified and non-monetized effects, you should also include a summary table that lists all the unquantified or non-monetized benefits and costs, and when feasible and appropriate highlight (*e.g.*, with categories or rank ordering) those that you believe are most important along with a reasoned explanation for your determination (*e.g.*, by highlighting factors such as the degree of certainty, expected magnitude such as the number of individuals affected, and reversibility of effects). The discussion and summary table of important unquantified and non-monetized effects should be placed prominently in your analysis to facilitate its consideration by policymakers and the public.

While the focus is often placed on benefits of regulatory action that are difficult to quantify or monetize, costs can be difficult to quantify or monetize as well.[86] For example, certain permitting requirements may restrict the decisions of production facilities to shift to new products and adopt innovative methods of production. While costs to innovation may be substantial, it is difficult to quantify and monetize these effects. When important costs cannot be analyzed quantitatively, they should be analyzed qualitatively, specifying who is affected and how.

[85] *See, e.g.*, Daniel A. Farber, "Breaking Bad? The Uneasy Case for Regulatory Breakeven Analysis," *California Law Review* 102, no. 6 (2014): 1469-1493; Rachel Bayefsky, Note, "Dignity as a Value in Agency Cost-Benefit Analysis," *Yale Law Journal* 123, no. 6 (2014): 1732-1782.
[86] Opportunity costs (or cost savings) of a regulation might not be reflected in agency budgets, which can create challenges in quantification. As an example of this phenomenon, an agency might not immediately devote fewer resources to processing applications when it issues a new regulation that shortens an application form, but the labor and other resources previously used for processing the longer form would, in the presence of the regulation, be freed for some other valuable purpose, such as achieving greater speed in the processing of the applications. Hence, there would be a cost savings attributable to the regulation. By the same reasoning, there is a cost attributable to a regulation if an agency will be performing enforcement activities or otherwise using resources in connection with that regulation, even if the agency's budget is not increasing.

AR_003157

For benefits or costs that are difficult to quantify or monetize, it may be helpful to solicit the views of outside experts or members of the public. Additional discussion of methods for doing so are included in the section on "*Quantitative Analysis of Uncertainty*."

iii. Threshold, Break-Even, Screening, and Order-of-Magnitude Comparisons

If the non-monetized benefits and costs are likely to be important, a "threshold" or "break-even" analysis may be considered for inclusion in a regulatory analysis. Threshold or break-even analysis asks what magnitude non-monetized benefits and costs would need to have for the regulation at issue to yield positive net benefits or to change which regulatory alternative is most net beneficial. Put differently, the method answers the question, "How small could the value of the non-monetized benefits be (or how large would the value of the non-monetized costs need to be) before the regulation would yield zero net benefits (or before the most net-beneficial regulatory alternative changes)?"

Break-even comparisons have strengths and limitations that you should be conscious of when employing them. It may be useful to focus a break-even analysis on whether the action under consideration will change the probability of events occurring or the potential magnitude of those events. For example, there may be instances when you have estimates of the expected outcome of a type of catastrophic event, but assessing the change in the probability of such an event may be difficult. Your break-even analysis could demonstrate how much a regulatory alternative would need to reduce the probability of a catastrophic event occurring in order to yield positive net benefits or change which regulatory alternative is most net beneficial. Regardless, you should avoid giving the impression that whether net benefits will be positive or negative, or which regulatory alternative is most net beneficial, is known with certainty in cases where such certainty is not possible.[87]

Break-even presentations may reflect situations in which multiple inputs are available (A,B) and other inputs are missing (X,Y). The analysis would demonstrate how A and B combine to quantify what is known about the scope and timing of the potential benefits (or costs), and how X and Y would need to combine for a regulatory provision to break even; a diagonal dividing line—which can be thought of as a break-even curve, as it represents all of the combinations of points that causes the analysis to break even—could divide a diagram with X and Y axes, or a table with X and Y rows and columns, into regions with positive and negative net benefits. In other words, a range of outcomes that represents the break-even state may be constructed from a set of combinations of outcomes and probabilities such that the levels of unknown benefits or costs allow the equality between them to hold.[88]

---

[87] For more on break-even analysis, *see, e.g.*, Cass R. Sunstein, "The Limits of Quantification," 102 *California Law Review* 102, no. 6 (2014): 1369-1421; Clark Nardinelli, "Some Pitfalls of Practical Benefit-Cost Analysis," *Journal of Benefit-Cost Analysis* 9, no. 3 (2018): 519-530.

[88] Suppose a pollution regulation's costs are estimated at $200 million per year and mortality-related benefits at $190 million per year. Suppose further that baseline evidence indicates 100,000 individuals experience non-fatal health harms—perhaps such that they stay home from work or school—on an average of two days per year, due to the pollution. Two challenging areas for estimating morbidity-related regulatory benefits might be quantifying the regulation's effectiveness at reducing health harm and monetizing the per-day benefit of avoiding the health harm.

Similarly, agencies may deploy "screening" or "order-of-magnitude" analysis when the quantitative information they have may not be of sufficient quantity or quality to produce precise estimates, but may be suited to produce information about the potential magnitude of the effects. For example, suppose there are three facilities emitting by-products of their production process through their air vents, and suppose there is insufficient information to model air transport, which would be necessary to estimate who might be exposed. If the agency knows the population of the nearby towns, by invoking reasonable assumptions about the transport distance of the air emissions, the agency would likely be able to present screening or order-of-magnitude analysis encompassing various scenarios.

j. Monetizing Health and Safety Benefits and Costs

In monetizing health benefits and costs, a WTP or WTA measure is the conceptually appropriate measure as compared to other alternatives (*e.g.*, cost of illness or lifetime earnings), in part because it attempts to capture pain and suffering and other quality-of-life effects. Using a WTP or WTA measure for health and safety allows you to directly compare your results to the other benefits and costs in your analysis, which will typically be based on WTP or WTA.

The valuation of fatal and nonfatal risk reduction is an evolving area in both results and methodology. You should utilize valuation methods that are appropriate for your regulatory circumstances. You should clearly indicate the methodology used and document your choice.

i. Nonfatal Health and Safety Risks

With regard to nonfatal health and safety risks, there is enormous diversity in the nature and severity of impaired health states. A traumatic injury that can be treated effectively in the emergency room without hospitalization or long-term care is different from a traumatic injury resulting in paraplegia. Severity differences are also important in evaluation of chronic diseases. The duration of an impaired health state, which can range from a day or two to several years or even a lifetime, need to be considered carefully, along with severity, when monetizing.

When monetizing nonfatal health effects, it is important to consider two components: (1) the private demand for prevention of the nonfatal health effect, to be represented by the

---

Points along the locus of break-even thresholds would include 100% effectiveness and $50 per day, 50% effectiveness and $100 per day, and 10% effectiveness and $500 per day.

Regulatory Effectiveness / **Daily Value**	10%	25%	50%	75%	100%
$500	0	+	+	+	+
$200	-	0	+	+	+
$100	-	-	0	+	+
$67	-	-	-	0	+
$50	-	-	-	-	0

Regulatory effectiveness (at preventing missed days of work or school) and the monetized value of daily absenteeism combine to yield negative net benefits (-), positive net benefits (+), or break-even status (0).

preferences of the target population at risk, and (2) the externalities associated with poor health.[89] Revealed-preference or stated-preference studies are necessary to estimate the private demand; health economics data from published sources may help estimate the externalities caused by changes in health status. If you use literature values to monetize nonfatal health and safety risks, it is important to make sure that the values you have selected are appropriate for the severity and duration of health effects to be addressed by your regulation.

If data are not available to support monetization using more direct WTP or WTA data, you might consider an alternative approach that makes use of health-utility measures like "quality-adjusted life years" (QALYs) and then monetizing using an estimate of the value per QALY.[90] Bear in mind, however, that a main drawback of integrated measures of this type is that they must meet some restrictive assumptions to represent a valid measure of individual preferences.[91] If you use this approach, you should be careful to acknowledge your assumptions and the limitations of your estimates.

ii. Fatality Risks

Since agencies often design health and safety regulations to reduce risks to life, evaluation of these benefits can be the key part of the analysis. A good analysis must present these benefits clearly and show their importance. Applying WTP is the best approach to use when monetizing reductions in fatality risk.

Some describe the monetized value of small changes in fatality risk as the "value of statistical life" (VSL). This term refers to the measurement of willingness to pay for reductions in only small risks of premature death. It has no application to an identifiable individual or to very large reductions in individual risks. It does not suggest that any individual's life can be expressed in monetary terms.

The term "statistical life" refers to the sum of risk reductions expected in a population. For example, if the annual risk of death is reduced by one in a million for each of two million people, that is said to represent two "statistical lives" extended (2 million people x 1/1,000,000 = 2). If the risk of death is reduced by one in 10 million for each of 20 million people, that also represents two statistical lives extended.

The adoption of a value for the projected reduction in the risk of premature mortality is the subject of continuing discussion within the economics and public policy analysis community. A considerable body of academic literature is available on this subject. Agencies have engaged in a consistent practice, over the course of several decades, of relying on this literature to

[89] Although this two-component guidance is presented for simplicity, distinguishing between private preferences and externalities is not always obvious. For example, if sick workers lose income, then changes in economic production—which otherwise may seem to represent externalities—may be partially or largely internalized in private demand for illness prevention.
[90] Although many academic studies calculate QALYs associated with both fatal and non-fatal outcomes, we note that, for regulatory analysis purposes, quality adjustment (the QA of QALY) should be used only in the portion of the analysis that focuses on non-fatal injury or illness.
[91] Joseph S. Pliskin, Donald S. Shepard, and Milton C. Weinstein, "Utility Functions for Life Years and Health Status," *Operations Research* 28, no. 1 (1980): 206-224.

estimate VSL. Based on this consistent practice, agencies typically utilize central estimates of VSL between $10 million to $12 million as of 2022, and regularly update these values to reflect inflation and real income growth.[92]

Another approach for expressing reductions in fatality risks is the life expectancy method, the "value of statistical life-years (VSLY) extended." If a regulation protects individuals whose average remaining life expectancy is 40 years, a risk reduction of one fatality is expressed as "40 life-years extended." Those who favor this alternative approach emphasize that the value of a statistical life is not a single number relevant for all situations. In particular, when there are significant differences between the effect on life expectancy for the population affected by a particular health risk and the populations studied in the labor market studies, they prefer to adopt a VSLY approach to reflect those differences. You should consider using estimates of both VSL and VSLY, while recognizing the developing state of knowledge in this area.

Longevity may be only one of a number of relevant considerations pertaining to a regulation. You should keep in mind that regulations with greater numbers of life-years extended are not necessarily better than regulations with fewer numbers of life-years extended. In any event, when you present estimates based on the VSLY method, you should adopt a larger VSLY estimate for senior citizens.[93]

When a regulation reduces mortality risk for a population that happens to experience a high rate of disability (where the regulation is not designed to affect the disability), the number of life-years saved should not be diminished simply because the regulation reduces risk for people with life-shortening disabilities. Both analytic simplicity and fairness suggest that the estimated number of life-years saved for the disabled population should be based on average life expectancy information for the relevant age cohorts.

iii. Valuation of Reductions in Health and Safety Risks to Children

The valuation of health outcomes for children and infants poses special challenges. It is rarely feasible to measure a child's willingness to pay for health improvement, and adults' concern for their own health is not necessarily relevant to valuation of child health. For example, the wage premiums demanded by workers to accept hazardous jobs are not necessarily appropriate to use for regulations that accomplish health gains for children. Some studies suggest that parents may value children's health more strongly than their own health. Although this parental perspective has been a promising research strategy, it may need to be expanded to include a societal interest in child health and safety.

Guidelines for Regulatory Impact Analysis, Appendix D: Updating Value per Statistical Life (VSL) Estimates for Inflation and Changes in Real Income (2021); Department of Transportation, *Treatment of the Value of Preventing Fatalities and Injuries in Preparing Economic Analyses* (2021). Agencies' standard practice has been to apply VSLs in regulatory analysis that do not vary by income at a given point in time for any U.S. citizens and residents.

[93] John D. Graham, Memorandum to the President's Management Council, *Benefit-Cost Methods and Lifesaving Rules* (May 30, 2003), https://www.whitehouse.gov/wp-content/uploads/legacy_drupal_files/omb/assets/regulatory_matters_pdf/pmc_benefit_cost_memo.pdf.

Where the primary objective of a regulation is to reduce the risk of injury, disease or mortality among children, you may develop a benefit-cost analysis to the extent that valid monetary values can be assigned to the primary expected health outcomes. For regulations where health gains are expected among both children and adults and you decide to perform a benefit-cost analysis, the monetary values for children should be at least as large as the values for adults (for the same probabilities and outcomes) unless there is specific and compelling evidence to suggest otherwise.

k. Accounting for the Benefits and Costs from Environmental Services, Ecosystem Services, and Natural Capital

In order to provide policymakers with relevant information, an analysis should account for effects on environmental or ecosystem services, or changes in the value of natural assets, if relevant and feasible, in your benefit-cost analysis. The phrase "ecosystem services" refers to the contributions to human welfare from the environment or ecosystems; the phrase "environmental services" refers to the abiotic portion of ecosystem services.[94] Natural assets, or natural capital, are physical biotic or abiotic natural resources capable of providing—or contributing to—future welfare, potentially through environmental or ecosystem services. Natural capital is distinguished from ecosystem services in that natural capital is a stock (measure of quantity) whereas ecosystem services are a flow (measure of change in quantity over time). The two are connected, as flows are the changes of a stock over time.

Many regulations will influence environmental or ecosystem services that directly impact the welfare of relevant populations. For example, a housing regulation may interact with air quality or open space influencing health outcomes, leisure opportunities, or both. It is helpful to identify relevant ecosystem services potentially impacted by the regulation under consideration. Where you identify relevant ecosystem services, you should seek to monetize their impacts when feasible, quantify impacts when monetization is not feasible, and describe qualitatively impacts that are not monetized or quantified. See the section "*Methods for Treating Non-Monetized Benefits and Costs*" and forthcoming OMB guidance on ecosystem services[95] for additional information and guidance. As with other benefits and costs, your analysis should be designed to account for each effect of a regulation exactly once.

8. Other Key Considerations

a. Other Benefit and Cost Considerations

i. Important Benefits and Costs to Consider

You should generally, if feasible, include these effects in your analysis and provide

AR_003162

estimates of their monetary values when they are substantial:

- private-sector compliance costs and savings;
- government administrative costs and savings;
- gains or losses in consumers' or producers' surpluses;
- discomfort or inconvenience costs and benefits; and
- gains or losses of time in work, leisure or commuting/travel settings.[96]

ii. Accounting for Technological and Other Changes Induced by Regulations

To the extent feasible, regulatory analysis should carefully forecast potential changes in technology and other economic or social conditions over time, and the implications of those changes for estimated benefits and costs. Technological, economic, social, and other conditions may evolve due to forces outside the regulatory framework under consideration. A baseline constitutes an analytically reasonable assessment of the way the world would look absent the regulatory action being assessed (see the section "*Developing an Analytic Baseline*" above), so these potential changes should be carefully considered in constructing one or more appropriate baselines for your analysis. That includes considering the likely technological changes that would have occurred in the absence of the regulatory action. If you assume that technology will remain unchanged in the absence of regulation when technological changes are likely, then your analysis may misstate both the benefits and costs attributable to the regulation.

Technological, economic, social, and other conditions also may evolve due to the design of the regulation under consideration. Regulations may provide incentives to increase technology innovation or impede such progress.[97] You should, when appropriate and feasible, consider cost-saving innovations that may result from a shift to regulatory performance standards and incentive-based policies. In addition, costs may result from a slowing in the rate of innovation or slowing of adoption of new technology due to delays introduced or exacerbated by the regulatory approval process or the setting of more stringent standards for new facilities than for existing ones. You should carefully account for the effects of incentives of your regulation.

In some cases, agencies are limited under statute to set regulatory standards based only on technologies that have been demonstrated to meet a legal standard of feasibility. In these situations, it is nevertheless appropriate to estimate benefits and costs in a manner that accounts for a wider range of technical possibilities in order to provide information to the public or policymakers.

There are other phenomena that may affect benefits and costs over time unrelated to the

---

[96] Estimating the opportunity cost of time is challenging and is often context dependent (*e.g.*, W. Douglass Shaw, "Searching for the Opportunity Cost of an Individual's Time," *Land Economics* 68, no. 1 (1992): 107-115). Analysts can develop their own well-reasoned estimates for the value of time. For time spent by workers that would have been spent doing other work, their compensation rate (*e.g.*, per unit of time) inclusive of taxes, overhead, and fringe benefits may be used as a proxy for the value of time. In the absence of more refined evidence, the same compensation estimate may also be used as a proxy for the value of time that non-working individuals could have spent doing other activities, with appropriate caveats.

[97] *See* Knut Blind, "The Influence of Regulations on Innovation: A Quantitative Assessment for OECD Countries," *Research Policy* 41, no. 2 (2012): 391-400.

AR_003163

development of novel technologies. For example, retrospective studies have provided some evidence that learning reduces the costs of a regulation in future years because the variable costs of deploying new technologies, or existing technologies in new applications, decrease.[98] The examination of variable cost reduction due to learning has an extensive history in the economics and engineering literatures. In your regulatory analysis, you may wish to consider any relevant studies of past rates of cost reductions resulting from such effects as learning, with due regard for the studies' timeliness and applicability to the regulation under consideration.

b. Accounting for Compliance and Take-up

You should endeavor to clearly present any key assumptions about compliance with a regulation. Assuming full compliance may be inappropriate when available evidence suggests imperfect compliance is likely. Both under-compliance and over-compliance may occur. Under-compliance occurs when regulated entities do not fulfill all of their obligations under a regulation. This often occurs when compliance costs exceed the expected costs of noncompliance.[99] Over-compliance occurs when regulated entities surpass the requirements set forth in a regulation. This is usually driven by uncertainty regarding compliance, the "lumpiness" of compliance technologies, risk aversion, or market factors such as consumer or shareholder preferences. When compliance issues are relevant to the analysis of a regulation, to the extent that doing so is feasible, your analysis should examine risks of non-compliance and reflect available evidence about compliance, in terms of the percentage of regulated entities in significant noncompliance or the level of compliance across various entities.

In the absence of evidence indicating that under-compliance or over-compliance with your regulation is likely, or when compliance issues are not material to the outcome of your analysis, assuming full compliance is often a reasonable default. If full compliance is assumed in other cases, agencies should generally try to explain why strong compliance is reasonably expected and whether alternative regulatory approaches could make compliance more likely. It may be helpful to specifically address the form of compliance strategies, communications, and enforcement; the resources needed, and availability of those resources, for those approaches; and how regulatory design and enforcement decisions will affect compliance and administrative costs. There is a rich economic literature in this area to build on.[100] It also may be helpful to consider the distributional effects of uneven compliance.

Consideration of compliance issues is especially important when analyzing regulatory actions intended to address compliance problems associated with prior regulations. In these

---

[98] *See* Art Fraas, Elizabeth Kopits, and Ann Wolverton, "A Review of Retrospective Cost Analyses," *Review of Environmental Economics and Policy* 17, no. 1 (2023): 22-42 for a meta-analysis of retrospective reviews.

[99] Although not an instance of non-compliance, an analytically similar case may occur when agencies grant regulated parties waivers or exemptions to regulatory requirements.

[100] *See* A. Mitchell Polinsky and Steven Shavell, "The Economic Theory of Public Enforcement of Law," *Journal of Economic Literature* 38, no. 1 (2000): 45-76 for a review of literature in this area; *see also* Anthony Heyes, "Implementing Environmental Regulation: Enforcement and Compliance," *Journal of Regulatory Economics* 17, no. 2 (2000): 107-129; Wayne B. Gray and Jay P. Shimshack, "The Effectiveness of Environmental Monitoring and Enforcement: A Review of the Empirical Evidence," *Review of Environmental Economics and Policy* 5, no. 1 (2011): 3-24; Jay P. Shimshack, "The Economics of Environmental Monitoring and Enforcement," *Annual Review of Resource Economics* 6, no. 1 (2014): 339-360 for an analysis of enforcement of environmental regulations.

cases, assuming a full-compliance baseline could lead to inaccurate conclusions about the effects of the new regulatory action. Suppose, for example, that an existing regulation was assessed at the time of its issuance assuming full eventual compliance, but this assumption turns out to have been overly optimistic, motivating the issuance of a new policy designed to improve compliance with the existing regulation. In this case, hewing to the assumption of full compliance with the original regulation would attribute zero benefits and zero (or otherwise-underestimated) costs to the new regulation, undermining the ability of a new regulatory analysis to inform decisions about the compliance-improvement policy. Instead, it would be most informative for the analytic baseline of the new regulation to reflect the best available evidence regarding the incomplete compliance with the earlier regulation.[101]

Estimates of incomplete compliance are most useful when noncompliance is identified with as much specificity as possible. For example, if noncompliance is driven by high compliance costs, estimating the costs of compliance separately for compliant and noncompliant facilities (that do not incur those costs) would likely be more accurate than simply scaling costs by the percentage of noncompliant facilities. More generally, a description of imperfect compliance in the baseline—consistent with the best available evidence—is generally the optimal starting point for analyzing the effects of policies meant to increase compliance.[102]

Sometimes entities anticipate more stringent regulations in the future and undertake actions to preemptively comply with or exempt themselves from such regulations, and it may be helpful for your analysis to examine data on relevant trends, the shape of cost curves for regulated entities, and other such considerations. When analyzing anticipatory compliance, you should capture the effects of regulatory anticipation consistently across both benefits and costs, such that both benefits and costs of compliance are attributed to the forthcoming regulation or both reflected in the baseline. If you estimate that entities will anticipatorily comply, you should generally provide the evidence supporting that estimate.

Consistency is similarly important when analyzing firms undertaking additional compliance measures not because of regulatory actions, but instead to meet consumer demand, to comply with overlapping legal requirements, or other reasons. For example, if you estimate that removing regulatory requirements will not have significant costs (forgone benefits) because regulated entities will continue to comply with the previous regulatory requirements either voluntarily or because of overlapping legal requirements (such as State or local laws), the same assumption should be applied to the estimation of benefits (cost-savings).

Similar issues can arise with respect to imperfect take-up of government program

[101] In these situations, it may be informative to present new estimates of the benefits and costs of the prior regulation, reflecting the lower-than-expected compliance.

[102] If systematic data about past compliance is not available, a multi-baseline analysis may be an especially informative approach. For example, if a delay of a previous regulation is announced—via rulemaking or a statement of enforcement discretion—between the issuance of a regulation and its impending compliance date, one set of estimates of the delay's effect should be calculated relative to a baseline of full compliance, even if this quantification is accompanied by an acknowledgement that the full-compliance baseline is overly simplistic. Information on compliance strategies or resources for enforcement would be a possible key input to a useful second baseline analysis, in which the incentives created by such strategies or enforcement lead to other compliance patterns.

benefits. Fewer individuals or entities may claim a benefit than are eligible to do so, potentially because of the costs of claiming the benefit, administrative burdens, informational barriers, or cognitive biases.[103] Just as with compliance, when take-up questions are relevant to the analysis, your analysis should reflect available evidence about take-up to the extent that doing so is feasible and appropriate. It may be particularly relevant to consider whether take-up rates may systematically vary across groups identified in any distributional analysis, as this could alter the expected distribution of benefits.

c. Accounting for Business Cycle Dynamics

Benefit-cost analysis often excludes consideration of business-cycle fluctuations in economic activity, which is a reasonable and tractable approach to conducting an analysis in most cases. However, in certain regulatory contexts—such as those relating to automatic stabilizers—an examination of how the frequency or severity of recessions interacts with the benefits and costs of a regulation can be useful. Whether such an analysis is useful will require both an assessment of the regulation's anticipated effects and the relevance of any interactions with business cycle dynamics.

If you determine that a regulation is likely to have substantially different effects over the course of recessions and recoveries, you should consider how to account for the benefits and costs attributable to these effects in your estimate of net benefits. Since the timing of business cycles is uncertain, these effects will also be uncertain. As a result, they should be presented and calculated in a manner that reflects their uncertainty. See the section "*Treatment of Uncertainty*" for additional discussion. Approaches you may consider range in formality from qualitative discussion of the issues to quantification of the expected benefits and costs (if applicable) in a calibrated economic model. It is helpful, in such an analysis, to carefully distinguish between the underlying causes of business cycles and the economic response to them generated by the regulation in question.

In any such analysis, you should focus on the benefits and costs attributable to a regulation's interactions with the business cycle. These results should be presented in whichever way most clearly conveys your findings while appropriately describing relevant underlying uncertainties. While impacts on macroeconomic aggregates such as consumption, employment,[104] or gross domestic product may be useful elements in estimating these benefits and costs, they are not themselves measures of benefits or costs. See the section "*Developing Benefit and Cost Estimates*" for a more detailed discussion of how to estimate such benefits and costs using the information available to you.

d. Accounting for the Effects of Market Power

The presence of market power may affect your benefit and cost estimates. You generally should account for the presence of market power—and changes in market power induced by your regulation—when it is relevant to the effects of the regulation under consideration. Regulations may affect market power in many ways. Examples include, but are not limited to, creating or lowering barriers to entry for new firms, increasing or decreasing the costs to consumers of switching among suppliers of a good, strengthening or limiting labor market competition in ways that impact workers, or limiting or enhancing monopoly power stemming from procurement decisions. Regulatory analysis should keep in mind the effects of government regulation in markets that are both "upstream" and "downstream" from the market that is directly affected. For a regulation that leads to a substantial increase or decrease in market power, for example, your analysis generally should examine the benefits and costs arising from these effects, which could arise from changes in the price and quantity of goods sold in that industry, quality of goods and services produced, or incentives to innovate, among other possibilities.

You should also be attentive to the possibility that regulations directly addressing issues other than market power may have meaningful indirect effects on market structure and competition, and it is informative to discuss and, if feasible, to quantify the benefits and costs arising from such effects in your analysis. For example, licensing or permitting requirements intended to increase safety may act as a barrier to entry, allowing incumbent firms to charge higher-than-competitive prices. In such cases, you should consider whether the regulation's safety benefits (along with the regulation's other benefits) outweigh any losses in consumer surplus caused by higher prices (along with the regulation's other costs), and whether there are alternatives that promote greater competition and would therefore have greater net benefits.

e. Accounting for Imperfect or Asymmetric Information

Generally, for regulations that materially reduce the burden of gathering and interpreting information, it will be informative to explain how that reduction in burden would impact market participants. When possible and appropriate, you should quantify such cost reductions for market participants and other affected individuals and entities. When relevant to your analysis of the presence of imperfect or asymmetric information, you should consider how information proliferation and access to information may fail to remedy information burden by resulting in information overload, producing a degree of confusion, or raising the cost of interpreting the information.[105] Simpler presentation of information might have higher benefits. On one hand, search technologies may have improved information access for many consumers and other market participants even as, on the other hand, label proliferation and other forms of information overload can lead to information-processing issues (and associated behavioral biases).

Some policies may make information available in a way that reduces information asymmetries, reducing or eliminating problems of adverse selection or moral hazard. For example, when product quality cannot be observed by consumers but is known by firms, requiring producers to disclose information about product quality may increase efficiency by

---

[105] *See* Oren Bar-Gill, David Schkade, and Cass R. Sunstein, "Drawing False Inferences from Mandated Disclosures," *Behavioural Public Policy* 3, no. 2 (2019): 209-227.

addressing adverse selection. To use another example, when limited liability creates an incentive for those shielded by it to take excessive risks, this moral hazard problem can be addressed by regulations that limit excessive risk-taking.

Policies that alter the availability of information can also impact producers directly. In some cases, increasing or decreasing the availability of information may have market power effects, for example by increasing or decreasing the ability of producers or employers to collude. In other cases, increasing the availability of information may increase producer efficiency, and therefore lead to benefits for the relevant firms' consumers, workers, or owners.[106]

9. Transfers

A transfer payment, in its simplest form, is a shift in money (or other item of value) from one party to another. More generally, when a regulation generates a gain for one group and an equal-dollar-value loss for another group, the regulation is said to cause a transfer from the latter group to the former. The term "transfer" is perhaps most commonly used in situations where a single effect of a regulation causes linked, exactly offsetting impacts on different groups. However, this linkage is not necessarily a defining feature of transfers, and different approaches to thinking about these effects are discussed below.

a. Consistent Treatment of Transfers in Your Estimates of Regulatory Impacts

There are two approaches to accounting for transfers, either of which you may apply in your regulatory analysis[107]:

i. Accounting for Transfers Separately from Benefits and Costs

This accounting approach excludes both sides of a transfer from your estimates of benefits and costs and provides a separate accounting of transfers. If you adopt this approach, you must, for consistency, exclude both sides of the transfer from your estimates of benefits and costs. (If you classify one side of a transfer as a benefit and the other as a transfer, or one side as a cost and the other side as a transfer, your estimate of net benefits will be incorrect.) Under this approach, distinguishing between benefits or costs and transfers can sometimes be difficult, and OMB is available as a resource if you are unsure of how to categorize particular effects.

When taking this accounting approach, it is informative to distinguish between analysis of transfers and assessment of who experiences regulatory benefits and costs. For instance, if a regulation implements a statute that calls for costly compliance activities and also expends Federal funds to reimburse entities performing such activities, the regulation's impact is

Kirby, "Trade Associations as Information Exchange Mechanisms," *RAND Journal of Economics* 19, no. 1 (1988): 138-146.

[107] It is generally helpful to use the same accounting approach across analyses of related regulations. OMB is available if case-by-case consultations would be helpful.

appropriately categorized as a cost borne by the Federal government for the share that is paid by the Federal government.

It will generally be appropriate to categorize an effect as a transfer if its effects on one group are exactly offset by its effects on another group or if there is a similarly direct link between the effect on one group and the effect on another group. Examples of *transfers* potentially include the following:

- Fees to government agencies for goods or services.[108]
- Tax payments from individuals or businesses to the government (monetary transfers from taxpayers to the government) and tax refunds from the government to individuals or businesses (monetary transfers from the government to taxpayers).[109]
- Payments by the government for goods or services provided by the private sector (that is, monetary transfers by the government to service providers, such as reimbursements by the Medicare program).
- Reductions in sales of a good or service by one business that are matched by increases in sales of the same good or service by another (that is, transfers in economic activity from one business to another).[110]
- Reductions in resources for some consumers that are matched by increases for others (that is, transfers of resources among consumers).

Separately, under this approach, examples of *benefits or costs*—as opposed to transfers—potentially include:

- Changes in use of goods and services to comply with relevant regulatory requirements.
- Changes in consumer and producer well-being resulting from regulation-induced price or quantity changes.
- Changes in premature death, illness, or disability.

Additionally, agency analysts should consider asking the following questions, which are likely to be helpful in the task of categorizing regulatory impacts:

- *Are effects naturally dollar-denominated?* If not, the impacts in question are unlikely to

---

[108] In some cases, user fees (or user fee changes) may provide a reasonable approximation of the incremental societal opportunity cost of a service that the government would not provide to the same extent, or at all, in the absence of the regulatory action. But when a fee is not a good proxy for the underlying cost to the government of providing the service, the cost to the government should be separately reported from the fee (with the fee categorized as a transfer). Regardless of whether that is the case, your presentation of transfers should complement other portions of your analysis—portions that may be accounting for the value of the goods or services to the feepayer as a benefit or the expense (to the government) of providing those goods or services as a cost.
[109] As a first-order approximation, tax payments are categorized as transfers. Tax payments may also have important negative or positive impacts on net benefits, for example through incentive effects or by funding socially valuable expenditure. Tax payments are only pure transfers when the marginal benefit of a dollar collected is equal to the marginal cost of a dollar collected.
[110] As a first-order approximation, such sales shifts are categorized as transfers. They may also have important negative or positive impacts on net benefits, for example if the relevant businesses have different costs of production or produce different externalities.

be transfers. For example, time spent on a compliance activity must be transformed into a monetary value using a wage or fee estimate; in other words, it is not naturally dollar-denominated, and thus is typically a cost.

- *Do estimates depend on behavior change?* If so, the impact for which the estimates have been developed is less likely to *purely* be a transfer.[111]

If you take this accounting approach, it is helpful to distinguish transfers caused by Federal budget actions, such as those stemming from a regulation affecting public benefits payments, from those that involve transfers between non-governmental parties, such as regulations that effectuate transfers between employers and employees or regulations that confer monopoly rents on a private party.[112] You can use as many categories of transfers as necessary to describe the major effects of a regulatory action.

ii. Accounting for Transfers as Offsetting Benefits and Costs

An alternative approach that you may choose to adopt is to include one side of a transfer as a benefit and the other side of a transfer as a cost, such that the transfer is treated symmetrically in your estimate of net benefits. Under this approach, a larger transfer will result in larger benefits and larger costs and a smaller transfer will result in smaller benefits and smaller costs. If you adopt this approach, it is important that you ensure that you include both sides of a transfer in your accounting. For example, a grant paid by the government to an individual should be included in your analysis as both a benefit to the individual and a cost to the government.[113]

One advantage of this second approach is that it can provide greater clarity in documenting the impacts on different parties. When you conduct a distributional analysis, and in particular when you compute an income-weighted estimate of the net benefits of a regulation in accordance with the section "*Weights and Benefit-Cost Analysis*," adopting this approach is necessary to ensure that all the significant effects on different groups are accounted for. This approach can also be useful if it is difficult to categorize whether or not various effects are transfers, but straightforward to account for them as benefits and costs. Under this second approach, you would not need to present a separate category of benefits and costs that are transfers unless you believe that the presentation of this information is valuable.

The proceeding discussion describes a transfer as a payment from one group to another. However, the ultimate effects of a transfer may not be so straightforward. For example, if the analysis evaluates the economic incidence of the transfer, those whose welfare is ultimately increased or decreased may be different from who initially pays the transfer and who initially receives it (see the section "*Distributional Effects*" for more details). Furthermore, there may be multiple groups contributing to the transfer and multiple groups receiving it, potentially making the exact amount transferred between any two groups unidentifiable. For these reasons, you should try to identify the groups that contribute to the transfer and those that receive the transfer

---

[111] See the section "*Further Guidance on Net Benefits from a Society-Wide Perspective*" for more detail on this point.
[112] See the section "*Presentation of Results and Accounting Statement*" for a suggested format for doing so.
[113] There may be some exceptions to this general statement—for example, if following it would generate double-counting when considered in combination with other portions of your analysis.

AR_003170

when summarizing the impacts of a regulation, rather than only who pays or receives the transfer. The sum of the transfers contributed to and received should still be equal in a traditionally-weighted analysis.

b. Further Guidance on Net Benefits from a Society-Wide Perspective

Transfers can induce important behavioral changes. These effects include, but are not limited to: changes in the net use of social resources; changes in consumer or producer welfare; or changes in premature death, illness, or disability (these categories overlap in some cases). A full analysis would incorporate estimates of relevant and significant behavioral effects, if feasible. A market model may be a useful tool for achieving appropriate society-wide accounting of net benefits that captures such effects; please see the section *"Partial and General Equilibrium Analysis.*"

For example, consider a regulation that increases payments to recipients of a public benefits program available only to retired individuals by five percent. The most straightforward impact of this regulation is a transfer to these recipients. In addition, this regulation might have important implications for retirement decisions for individuals eligible for the public benefits program. This, in turn, could have broad impacts across the labor market, with potentially large implications for the benefits and costs of the regulation.

As a further illustration, consider a regulation that implements a new Federal spending program in a market characterized by some distortion, such as a positive externality. The payment amount may be most readily categorized as a transfer. This effect would be accompanied by external benefits, that is, benefits experienced by individuals not directly receiving payments.

c. The Marginal Cost of Public Funds

Regulations that affect net transfers from the government will lead to changes in the Federal debt, taxes or other revenues, or government spending. As governmental transfers make up a larger share of a regulation's total effects, partial estimation of that regulation's net benefits—*i.e.*, estimates that do not account for resulting changes to the Federal debt, taxes, or government spending—becomes increasingly less informative. Relatedly, net benefits comparisons across regulatory alternatives are likely to be more informative if the alternatives have similar effects on governmental transfers.

One approach to estimating welfare effects associated with transfers from the government to other entities is to apply a factor known as the marginal cost of public funds. This factor is an estimate of the distortionary cost of taxation. For example, people take actions to avoid paying tax, such as choosing to work fewer hours, sheltering more income from tax using available deductions, or hiring a tax lawyer to set up trusts to minimize tax liabilities. Whether or not to apply this factor in an analysis can be particularly consequential for regulations that cause a material increase or decrease in Federal outlays, such as a regulation that modifies the eligibility criteria for an existing policy or program.[114] However, agencies generally should not make this adjustment in analyses of regulations associated with spending programs.

This longstanding approach of not making such adjustments in analysis of individual regulations is due to several reasons, including because such regulations typically do not make offsetting changes to tax policy. For example, if a regulation would increase Medicare spending by some amount but would not directly affect the tax system, applying a marginal cost of public funds in the primary analysis may inappropriately express false certainty about the attribution to the Medicare regulation of effects of an assumed change in tax rates. In practice, these two policies (*i.e.*, changes to Medicare, and changes to tax rates) may not be correlated at all. Additionally, any such analysis could be further complicated by the nature of how the tax system is designed. The benefits and costs of behavioral responses to taxation will vary with the form of taxation enacted; for example, taxation of a negative externality may produce behavioral responses with substantial net social benefits.[115] Another challenge in using a marginal cost of public funds is that estimates of the distortionary costs of taxation often ignore distributional considerations.[116]

10. Distributional Effects

The benefits and costs of a regulation are ultimately experienced by people. For some regulations, different groups of people may be impacted differently. Distributional analysis, whether quantitative or qualitative, can help illustrate these effects. This section provides agencies guidance on undertaking distributional analysis when they choose to do so.[117]

a. General Issues

The term "distributional effect" refers to how the benefits and the costs of a regulatory action are ultimately experienced across the population and economy, divided up in various ways (*e.g.*, income groups, race or ethnicity, sex, gender, sexual orientation, disability, occupation, or geography; or relevant categories for firms, including firm size and industrial sector). The benefits and costs of a regulation may also be distributed unevenly over time, resulting in regulatory benefits and costs falling on different individuals or different groups of individuals; for example, lead remediation will have costs concentrated at the time of remediation, but benefits that persist over many decades. A regulation may deliver net benefits to one group while imposing net costs on other groups. A regulation may also deliver relatively more net benefits to one group than to another: for example, because of differences in cumulative exposures or underlying health risk factors, reducing the emissions of harmful pollution may benefit certain

AR_003172

exposed populations more or less than others (as measured by absolute or relative reductions in health risks).

A "distributional analysis" is performed to estimate the likely effects of the regulation on those in the groups being analyzed. This analysis involves estimation of the benefits, costs, and net benefits expected for each of these groups, if such data are available. You should not assume that average incidence of a regulatory benefit or cost is equally applicable to particular groups, or that incidence for only one population group is equally applicable to other groups, without justification. If the relevant disaggregated quantitative data is not available, you may still be able to provide a qualitative distributional analysis.

The question of who will ultimately experience the benefits and bear the costs of any regulation warrants close attention in a distributional analysis. For example, if a regulation is expected to raise a manufacturer's costs of production, that manufacturer may be able to pass on a portion of those costs to its customers in the form of higher prices. The portion of the cost burden that remains with the manufacturer may be split between owners of the manufacturer and its workers. Estimating where the incidence of such costs will fall may be uncertain. Your analysis should account for any important sources of uncertainty in your estimates. When data does not support quantification of incidence, you should still describe qualitatively which groups are likely to be most affected and how, whenever feasible and appropriate.

In evaluating the distributional effects of a regulation, contextual considerations can be critical; for example, what appears to be a policy with an inequitable distribution of net benefits when analyzed in isolation may in fact be remedying inequitable conditions that exist in the baseline. For that reason, it is often important to assess and present the distribution of conditions in the baseline, in addition to the distribution of regulatory effects. It may be useful for agencies to produce agency-specific guidance regarding the analysis of distributional effects, identifying particular groups likely to be affected by that agency's regulations or any methodological or other issues that are particularly relevant for that agency.

b. When to Perform Distributional Analysis

Reasonably available methodologies and data, as well as input from experts and the public, can inform an agency's determination as to whether production of a distributional analysis is practical, appropriate, consistent with law, and will produce relevant and useful information in a specific context. Distributional effects may merit specific attention when disaggregated analysis is required by the statute(s) under which the regulation is issued, warranted by the need for regulatory action identified in your regulatory analysis, or called for by an Executive Order.

Distributional effects exist whether or not a distributional analysis is produced. But by producing a distributional analysis, you may be able to better identify alternative regulatory options or costs that can be mitigated through other regulatory or non-regulatory decisions, whether by your agency or others. Production of a distributional analysis may allow for more effective consideration of regulatory alternatives. Accordingly, when you decide to conduct a distributional analysis of a regulation, you should also conduct distributional analyses for each of the regulatory alternatives presented in the regulatory analysis, consistent with the availability of resources, appropriate methods, and data. Such analysis can be particularly useful when the distributional effects are likely to be material to your agency's decision to move forward with the regulation or to adopt one regulatory approach over other alternatives.

c. Group Identification for Distributional Analysis

If you conduct a distributional analysis, you will need to identify the groups across which estimates of the benefits, costs, and net benefits of a regulation are to be disaggregated. The groups that are relevant to the analysis will vary depending on the regulatory context. In general, it is most informative to focus analytic efforts on the groups for which the variation of regulatory effects is likely to be important in the context of your regulatory action. To the extent possible given available evidence, it is advisable for agencies to be consistent when identifying groups of interest across their regulations—particularly for regulations addressing similar concerns—or else explain their rationale for not doing so. For example, using consistent definitions of income groups across regulations may facilitate comparison of distributional effects across an agency's regulations. Relatedly, if an agency identifies different groups of interest when analyzing regulations because of differences in the relevant statutory provisions underlying those regulations, the agency should state so explicitly.

It will sometimes be informative to consider whether a regulation's effects will differ by income group. A distributional analysis that focuses on income groups should be tailored to the context of the regulation under consideration. Frequently, an analysis by income ranges or percentiles (*e.g.*, quintiles or deciles of the income distribution, if such data are available to you) will be most tractable and appropriate. However, other approaches may be more appropriate in certain circumstances. For statutory frameworks that operate by reference to the Federal poverty thresholds or the Federal poverty guidelines, for example, an analysis by reference to those thresholds or guidelines may be most informative. But subject to data availability and statutory frameworks, there are advantages to using consistent groupings across analyses.

When choosing how to identify groups for evaluation, you should consider whether the choice of groups could obscure the relevant distributional effects. For example, if a regulation affects only individuals in the lowest decile of income, grouping individuals by income quartile will make the average size of such effects on the lowest decile appear smaller than they are. This concern is magnified if there are both positive and negative effects for subgroups within the constructed group. You will also need to consider whether to analyze income per individual, per family, or per household, and how to account for differences in household or family size when measuring income by group. Whenever it is feasible and appropriate to do so, you should use estimates of income that account for government taxes and transfer programs.

Other economic and demographic categories such as those based on race and ethnicity, sex, gender, geography, wealth, disability, sexual orientation, religion, national origin, age or birth cohort, family composition, occupation, or veteran status—among others—may be relevant to a particular regulation.[118] When this is the case, when consistent with law, and if relevant data

[118] Certain groups that are defined by Federal agencies, such as food-insecure or energy-insecure, may also provide context-relevant categories.

are available, it may be useful to analyze the incidence of regulatory effects on each group of interest, or combinations of those groups. If identifying groups for distributional analysis by race and ethnicity, you should follow OMB's guidance on the topic.[119] Similarly, distributional analysis by gender should define gender categories according to OMB guidance.[120]

d. Producing a Distributional Analysis

The guidance provided in this section is particularly relevant to quantitative distributional analyses, but may also be helpful in designing some qualitative analyses. Both types of analysis may be useful approaches for agencies looking to explore distributional effects.

If you determine that a distributional analysis is appropriate, it may be necessary to identify the baseline relevant to each group. For example, if a regulation is expected to have a differential effect on a specific geographical region, the change in relevant demographics in that region over time may differ from other regions, and the distributional analysis should account for those baseline differences.[121] For more discussion on this point, see the section "*Developing an Analytic Baseline*."

You should estimate the regulation's effects on relevant groups, relative to the baseline, as well as the effects of regulatory alternatives under consideration. In some cases, members of different groups may exhibit systematically different responses to the same regulation, which could be relevant to estimating the regulation's effects on each group. For each group, you should account for all benefits expected to be experienced by members of the group as a result of the regulation, and subtract all of the costs expected to be borne by members of the group, to the extent feasible.[122] It is important to account for key categories of benefits and costs in your analysis of each alternative, including both monetized and non-monetized effects, as feasible and appropriate.

In a distributional analysis, sound monetized estimates are preferred to non-monetized estimates, if their production is feasible and appropriate. When data limitations make monetization difficult, evidence related to distributional effects could be presented quantitatively or qualitatively. For example, if a regulation reduces certain types of accidents, but the WTP to

---

[119] As of the writing of this Circular, the most recent guidance on race and ethnicity categories is available in Office of Management & Budget, *Revisions to the Standards for the Classification of Federal Data on Race and Ethnicity*, 62 Fed. Reg. 58,782 (Oct. 30, 1997). Please attend to any updates to this guidance over time.
[120] As of the writing of this Circular, the most recent guidance on gender categories is available in Interagency Technical Working Group on Sexual Orientation and Gender Identity, *Items in the Household Pulse Survey: Report and Recommendations* (Apr. 30, 2021), https://omb.report/icr/202106-0607-003/doc/112605500. OMB's Statistical and Science Policy Office chaired this Interagency Technical Working Group (ITWG), and the ITWG provides recommendations to guide OMB. Please attend to any updates to this guidance over time.
[121] Consistent with the following paragraph, you could also compare demographic changes in the baseline (if any) to how demographics are likely to change under each regulatory alternative under consideration.
[122] When estimating the effects of a regulation on different groups, it is appropriate to take into account how the regulation will impact government tax collection where it is feasible to do so. For example, if a regulation increases wages of a given income group by $100, but that group's wage tax rate is 20%, only $80 of income should be attributed to the group, and the other $20 should be counted as increasing government revenues. *See* Nathaniel Hendren and Ben Sprung-Keyser, "A Unified Welfare Analysis of Government Policies," *Quarterly Journal of Economics* 135, no. 3 (2020): 1209-1318.

reduce such accidents is unknown, the frequency of accident reduction by group can be reported. In some cases, the distribution of regulatory effects may be clear from the available evidence, but the nature of the regulatory effect itself renders it difficult to monetize. See the section "*Methods for Treating Non-Monetized Benefits and Costs*" for more detail on how to incorporate non-monetized effects into regulatory analysis. Agencies may also consider collecting additional data that would help estimate the monetized incidence of certain regulatory effects if they expect to issue regulations that could be informed by such information in the future.

Finally, when distributional effects are relevant to the agency's decision, you should summarize your results and describe your analysis in a manner that supports transparency and comprehensibility for policymakers and the public. For example, if your regulation is likely to have geographically differentiated effects, maps may help to clarify where the benefits or costs will be felt. While graphs or maps may be illustrative, care should be taken to ensure that the format of such figures is accessible. It is generally not sufficient for your analysis to merely state that the chosen regulatory alternative does not reduce net benefits for relevant groups; it is important to analyze and describe the benefits and costs of different regulatory alternatives for relevant groups.

Further, in such cases, agencies should endeavor to be specific, in a regulatory preamble or in the brief background section that introduces a regulatory analysis, about the nature of the distributional interests the agency is considering, in order to allow policymakers and the public to better understand the connection between the distributional interest being pursued and the analysis of the regulation. This interest may lead an agency to select a regulatory alternative with lower monetized net benefits over another with higher monetized net benefits because of the difference in how those net benefits are distributed in each alternative.[123]

e. Weights and Benefit-Cost Analysis

In traditional benefit-cost analysis, the sum of the net benefits across society equals the aggregate net benefits of the regulation. Any approach to estimating aggregate net benefits uses distributional weights. An analysis that sums dollar-denominated net benefits across all individuals to measure aggregate net benefits—as the traditional approach generally does—adopts weights such that a dollar is equal in value for each person, regardless of income (or other economic status).

Agencies may choose to conduct a benefit-cost analysis that applies weights to the benefits and costs accruing to different groups in order to account for the diminishing marginal utility of goods when aggregating those benefits and costs. Diminishing marginal utility means that an additional unit of a good is more valuable to a person (in welfare terms) if they have fewer total goods than if they have more total goods. Weights of this type are most commonly applied in the context of variation in net benefits by income, consumption, or other measures of economic status.

If you decide to produce an estimate of net benefits utilizing such weights, you may treat it as your primary estimate of net benefits, or as a supplemental estimate. The same weights

[123] See Section 1 of Executive Order 12866. 58 Fed. Reg. 51,735 (Oct. 4, 1993)

should be applied to benefits and costs consistently in each analysis, and the weights that you used in each analysis should be communicated clearly. Analyses applying weights that account for diminishing marginal utility will be more informative in proportion to the quality of the evidence on the distribution of benefits and costs experienced across the population.

Note that the characteristics of the parties who bear the *costs* of a regulation, not only the characteristics of the parties who experience the *benefits*, can greatly influence the estimate of net benefits when such weights are used. In addition, analyses applying weights of this type to benefits and costs that are estimated with more granularity will, holding all else equal, be more informative than if benefits and costs are estimated with less granularity. Conversely, such analyses are less informative about the welfare effects of the regulation the less precisely agencies identify and monetize the distributional incidence of benefits and costs. Accordingly, as analytic methods improve, agencies' ability to produce informative estimates using such weights—and the quality of those estimates—will increase.

Agencies should not treat estimates using weights that account for diminishing marginal utility as primary if they are less informative about the welfare effects of the regulation than traditionally-weighted estimates (sometimes, albeit inaccurately, referred to as "unweighted" estimates). As noted in the section "*Some General Considerations*" you should also present traditionally-weighted estimates when conducting an analysis using weights that account for diminishing marginal utility, and present the distribution of monetized net benefits for each analyzed group in undiscounted dollars.

One practical approach to implementing weights that account for diminishing marginal utility uses a constant-elasticity specification to determine the weights for subgroups defined by annual income.[124] To compute an estimate of the net benefits of a regulation using this approach, you first compute the traditional net benefits for each subgroup. You can then compute a weighted sum of the subgroup-specific net benefits: the weight for each subgroup is the median income[125] for that subgroup divided by the U.S. median income, raised to the power of the absolute value of the income elasticity of marginal utility times negative one.[126] OMB has

[124] As noted previously, income—as used here—is inclusive of government taxes and transfer programs. Subgroups can also be defined by lifetime income, consumption, or other measures of economic status when data is available and doing so is appropriate and relevant in the regulatory context.

[125] There may be circumstances when specifying weights as a function of the mean, rather than median, income for each subgroup is appropriate for your analysis, such as when it increases consistency between the calculated weight and the incidence of benefits and costs within the subgroup. For example, if the incidence of net benefits is proportional to income, mean income may be the more appropriate measure of income, whereas if the incidence of net benefits is per capita, median may be the more appropriate measure.

[126] In other words, you can compute a weighted sum of the subgroup-specific net benefits where the weight for subgroup i, denoted w_i, is

$$w_i = \left(\frac{\bar{y}_i}{y_{\text{med}}}\right)^{-\varepsilon}$$

In this formula, $\bar{y}_i$ is the median income for subgroup i, y_{med} is U.S. median income, and ε is the absolute value of the elasticity of marginal utility. As noted previously, you will need to consider how to account for differences in household or family size when measuring income by group.

More generally, calculating the income-weighted sum of subgroup-specific net benefits is most useful when net transfers to government—if the analysis does not account for what such governments do with such determined that 1.4 is a reasonable estimate of the absolute value of the income elasticity of marginal utility for use in regulatory analyses.[127]

If you are using population averages for benefits or costs, you should consider that such values are often implicitly income weighted already, and strive to weight all benefits and costs consistently.[128] For example, it is appropriate to use a value for mortality risk reductions (sometimes referred to as the value of a statistical life, or VSL) that does not depend on the income of the sub-population to which the mortality risk reduction benefits accrue, consistent with the guidance provided elsewhere in this Circular.[129] This amounts to weighting mortality risks by the income elasticity of marginal utility (given that it is also the income elasticity of individuals' valuations of a marginal mortality risk). In practice, therefore, you should not apply income weights to such values of mortality risk reductions; they have already been weighted by income.

11. Treatment of Uncertainty

The precise consequences (benefits and costs) of regulatory options are not generally known for certain, as there may be uncertainty regarding the incidence and magnitudes of such consequences and the probability of their occurrence. However, reasonable estimates of such uncertain consequences can often be developed. An effect of a regulation should not be excluded from a regulatory analysis simply because its estimation is highly uncertain. There may be other reasons to exclude effects (*e.g.*, because the size of the effect is negligible). But even for highly uncertain effects, it is often possible to use available evidence to produce estimates of those effects for inclusion in a regulatory analysis that are more accurate than assuming uncertain effects do not occur or have no benefits or costs. Moreover, inclusion of uncertain effects is necessary for the robustness of a regulatory analysis when those uncertain effects are an important contributor to the benefits and costs of a regulation. However, you should be particularly careful when interpreting effects that are highly speculative.

It will often be helpful to begin your analysis of uncertainty at the earliest possible stage

transfers—are small relative to other effects, and thus the estimate of income-weighted net benefits is relatively insensitive to the weighting applied to such transfers. Note that an appropriate weighting for effects on government budgets depends on the use or source of funds, which will often be indeterminate in regulatory contexts. Calculating the income-weighted sum of subgroup-specific net benefits will also be useful when net government transfers are essentially unchanged across regulatory alternatives, as the ranking of alternatives will be unaffected by the weighting of government transfers. Also note that altering this approach may be appropriate when analyzing regulations with an international scope. See the section "*Scope of Analysis*" for more discussion of such regulations.

[127] *See* Office of Management & Budget, *OMB Circular No. A-4: Explanation and Response to Public Input* (Nov. 9, 2023), *https://www.whitehouse.gov/wp-content/uploads/2023/11/CircularA-4Explanation.pdf*. As the economic literature estimating the income elasticity of marginal utility continues to improve, OMB's best estimate of this value may be refined in future revisions of this Circular, and agencies may determine that another estimate of the income elasticity of marginal utility is most appropriate in the context of a particular regulatory analysis.

[128] See *OMB Circular No. A-4: Explanation and Response to Public Input* (Nov. 9, 2023), *https://www.whitehouse.gov/wp-content/uploads/2023/11/CircularA-4Explanation.pdf*, for further details on how to adjust population-average metrics that are implicitly weighted by income already.

[129] Agencies' standard practice, which this Circular has implicitly endorsed since 2003, has been to apply VSLs in regulatory analysis that do not vary by income for all U.S. citizens and residents at a given point in time. This can be viewed as a way in which income weighting has long been integrated into the traditional approach to regulatory analysis.

AR_003178

in developing your analysis. It may be informative to consider both the statistical variability[130] of key elements underlying the estimates of benefits and costs (for example, the expected change in the distribution of automobile accident deaths that might result from a change in automobile safety standards) and the incomplete knowledge about these key elements or relationships among key elements (for example, the uncertain knowledge of how driver behavior might affect automobile accident outcomes).[131] Assessing important sources of uncertainty and the way in which benefit and cost estimates may be affected under plausible assumptions often provides useful information to decision makers and the public about the effects and the uncertainties of alternative regulatory actions. Both qualitative and quantitative assessments of uncertainty can provide useful information. It is generally helpful to distinguish between uncertainties regarding the accuracy of estimates and the precision of estimates.[132]

The treatment of uncertainty should be guided by the same principles of full disclosure and transparency that apply to other elements of your regulatory analysis. Your analysis should be credible, objective, realistic, and scientifically balanced.[133] You should generally discuss the sources of the available data used and any particularly significant aspects of its quality. Inferences and assumptions used in your analysis should be identified, and your analytical choices should be adequately justified. If the analytic results are sensitive to a given assumption or data source, alternative modeling assumptions or data sources can be used to demonstrate the sensitivity of the results. Alternative data and models that you use to analyze uncertainty should be described in detail or with references to ensure the public can find such information. In your presentation, it is informative to delineate the strengths of your analysis along with important uncertainties about its conclusions. Your presentation should also generally explain, when relevant, how your analytical choices have significantly affected your results.

In some cases, the level of scientific uncertainty—including economic uncertainty—may

[130] In some contexts, the word "variability" or "risk" is used as a synonym for statistical variation that can be described by a theoretically valid distribution function, whereas "uncertainty" refers to a more fundamental lack of knowledge. This Circular uses the terms "risk" and "uncertainty" to refer to both concepts.

[131] In addition to distinguishing between the underlying probabilistic nature of an element (aleatory uncertainty) and incomplete knowledge about elements (epistemic uncertainty) noted previously, it may be useful to distinguish between two types of epistemic uncertainty: measurement uncertainty and model (or process) uncertainty. Measurement uncertainty exists because of the challenges in accurately and precisely measuring various properties in the world. This sort of uncertainty can usually be described statistically; when considering measurement uncertainty, you may wish to describe the robustness of estimates to alternative measurement techniques and assumptions. Model uncertainty refers to uncertainty about which model—*i.e.*, description of the causal relationship among elements—best describes the underlying relationships. While modeling choices should be grounded in the best available science, there is often more than one model that is consistent with the available evidence. Model uncertainty is more difficult to describe statistically than measurement uncertainty, often because of conceptual challenges or a lack of variability in data that would enable the model uncertainty to be reduced to measurement uncertainty. Still, when feasible, you could consider multiple models to establish robustness and reduce model uncertainty.

[132] Accuracy refers to how close an estimate is to the true value in question. Precision refers to the resolution of that estimate (*e.g.*, the number of significant figures for a numerical estimate). See the section "*Precision of Estimates*" for more details.

[133] When disseminating information, agencies should follow their own information quality guidelines, issued in conformance with the OMB government-wide guidelines. *See* Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies; Republication, 67 Fed. Reg. 8452 (Feb. 22, 2002).

be so large that you can only present discrete alternative scenarios without assessing the relative likelihood of each scenario quantitatively. In such cases, you might choose to present results from a range of plausible scenarios, together with any available information that might help in qualitatively determining which scenario is most likely to occur and the likelihood relative to other scenarios.

In some situations, particularly where irreversibility is material to your analysis, such as when you are regulating an exhaustible resource or an endangered species, or when the timing of economic developments is central to your regulation's benefits and costs, it may be useful to analyze a regulation with uncertain effects as an option (referred to in the academic literature as "real options" analysis).[134] The assessment of real options allows you to monetize the benefits and costs of changing the timing of regulatory effects in light of the value of information about potential states of the world that can be learned over time. The costs of shifting the timing of regulatory effects further into the future may be especially high when regulating to protect against irreversible harms. For example, a regulation that preserves a natural resource today may preserve option value associated with future uses of that resource that are unknown today. Over the duration of time that regulatory effects are deferred, you may learn additional information that reduces uncertainty about some of those regulatory effects. When uncertainty about the regulation's effects stems from a lack of data sources, you may want to collect appropriate data as part of regulatory action to help inform future analyses. Formal tools for assessing the value of additional information are well developed in the applied decision sciences and can be used when appropriate.[135] You may wish to consider doing original research, if feasible and appropriate to your regulation. Decision trees may be helpful visual devices in analyzing real option value.

a. Quantitative Analysis of Uncertainty

Uncertainty can often be subject to quantitative analysis, broadly defined. Examples would include quantitative estimates of the probabilities of environmental damage (for example, to soil or water, the possible loss of habitat, or endangered species), probabilities of harm to human health and safety, etc. There are also uncertainties associated with monetizing estimates of economic benefits and costs, such as improved consumer health associated with a regulation that increases safety (a regulatory benefit) or the additional costs of implementing these safety improvements (a regulatory cost). Thus, your analysis may benefit from including multiple components of uncertainty, reflective of the number of inputs used to generate an impact estimate; for example, a quantitative analysis characterizing the probabilities of the relevant outcomes (that are not already valued in monetary terms) and an assignment of economic value to the projected outcomes. It is essential that both parts be conceptually consistent. In particular, the quantitative analysis should be conducted in a way that permits it to be applied within a more

general analytical framework, such as benefit-cost analysis. For example, you should address explicitly the implications for benefits and costs of any probability distributions developed in your analysis.

As with other elements of regulatory analysis, you will need to balance thoroughness with the practical limits on your analytical capabilities and the opportunity cost of more thorough analysis of uncertainty. Your analysis does not have to be exhaustive, nor is it necessary to evaluate each alternative at every step. Your analysis should target the inputs, approaches, and assumptions that have particularly significant effects on the analytic results, and that are subject to significant uncertainty. The overall goal is for the inputs, approaches, and assumptions in your analysis to be clearly identified and consistent with the relevant science. Your analysis should provide sufficient information for decision makers to grasp the degree of scientific uncertainty and the robustness of estimated probabilities, benefits, and costs to changes in key assumptions.

Your estimates cannot usually be more precise than their most uncertain component.[136] Thus, your analysis should, when feasible and appropriate, report estimates in a way that reflects the degree of uncertainty and does not create a false sense of precision (see the section "*Precision of Estimates*" for more details), including using appropriate significant figures. Worst-case or bounding analyses do not adequately convey the complete probability distribution of outcomes, and are therefore of limited use in the context of conducting uncertainty analysis. Whenever it is feasible to quantitatively characterize the probability distributions, you should provide some estimates of central tendency (*e.g.*, mean or median) in addition to ranges, variances, specified low-end and high-end percentile estimates, and other characteristics of the distribution. Expert elicitation, discussed in more detail below, can be helpful in bridging the gap between existing evidence and the information required to produce such estimates. Even when probability distributions are unknown, an assumption about the distribution may be implied in your analysis. When this is the case, you should try to make these assumptions explicit.[137]

When feasible, you should use appropriate statistical techniques to determine a probability distribution of the relevant outcomes. For rules with large consequences (such as regulations with projected annual economic effects of $1 billion or more), you should, when feasible and appropriate, present a formal quantitative analysis of the relevant uncertainties about benefits and costs, *i.e.*, provide an estimate of the probability distribution of regulatory effects. This approach is often appropriate for complex regulations where there are large, multiple uncertainties whose analysis raises technical challenges, or where the effects cascade. At the same time, you should consider performing formal quantitative analysis for rules that have smaller impacts when you determine such analysis is appropriate.

[136] The exception is distributions where component variables have negative covariance, as this could produce estimates with more precision than the most uncertain component.
[137] In many health and safety regulations, analysts rely on formal risk assessments that address a variety of risk management questions, such as the baseline risk for the affected population, the safe level of exposure, or the amount of risk that would be reduced by various interventions. Because the answers to some of these questions are directly used in benefits analyses, the risk assessment methodology must allow for the determination of expected benefits in order to be comparable to expected costs. This means that bounding exercises unaccompanied by central estimates are likely to result in benefit estimates that exceed the appropriate certainty-equivalent (see the section "*Economic Values of Uncertain Outcomes*") or expected value measure.

For regulations with projected gross annual benefits or costs of $200 million[138] to $1 billion, you should seek to use appropriately rigorous approaches to account for uncertainty. Relatively more rigorous tools may be especially helpful when net benefits are projected to be close to zero and uncertainty is substantial. On the other hand, rigorous uncertainty analysis may not be valuable for regulations in this category if simpler techniques are sufficient to show robustness, *i.e.*, that the net benefit values are relatively unaffected by changes in uncertain parameters or models.

You may find it helpful to consider the following analytical approaches that entail increasing levels of complexity:

- Discuss qualitatively the main uncertainties in each important input to the calculation of benefits and costs. These disclosures would address the uncertainties in the data as well as in the analytical results. However, as previously mentioned, regulations above the $1 billion annual threshold generally should also receive a formal treatment when feasible and appropriate.
- Use a numerical sensitivity analysis to examine how the results of your analysis vary with plausible changes in assumptions, choices of input data, valuation metrics, and alternative analytical approaches. Sensitivity analysis is especially valuable when the information is lacking to carry out a formal probabilistic simulation. Sensitivity analysis can be used to find "switch points," critical parameter values at which estimated net benefits change sign or the alternative with the most net benefits switches. Sensitivity analysis usually proceeds by changing one variable or assumption at a time, but it can also be done by varying a combination of variables simultaneously to learn more about the robustness of your results to widespread changes.
- Apply a formal probabilistic analysis of the relevant uncertainties, possibly using simulation models or expert judgment as revealed, for example, through Delphi methods.[139] Expert judgment is often elicited through a survey process which eliminates certain interactions between experts, and may be a useful way to fill key gaps in your ability to assess uncertainty.[140] These expert elicitations, along with other sources of data, can be combined in Monte Carlo simulations to derive a probability distribution of benefits and costs.

New methods of analyzing uncertainty may become available in the future. This Circular is not intended to discourage or inhibit their use (or the use of other available and appropriate methods), but rather to encourage and stimulate their adoption as appropriate.

b. Economic Values of Uncertain Outcomes

In developing benefit and cost estimates, you may develop probability distributions of values for each outcome. When this is the case, you will need to combine these probability distributions to provide estimates of total benefits or costs. Where there is a distribution of outcomes, you may often find it useful to emphasize summary statistics or figures that can be readily understood and compared to achieve the broadest public understanding of your findings.

In measuring the value of uncertain outcomes, you will need to determine how to account for risk preferences, including risk aversion.[141] People are risk averse when they prefer more certain outcomes to less certain outcomes with the same expected value. Risk aversion is widespread, and an underlying motivation for insurance and savings behavior. For example, people often purchase life insurance because they value the financial protection for their beneficiaries in the case of their premature death more than the insurance premiums that they must pay. However, not all relevant parties are risk averse in all contexts, and therefore risk aversion may not be an appropriate assumption in all parts of your analysis. For example, firms are often not risk averse[142]; in such cases, if your regulation is, for instance, intended to encourage investments in novel technology to reduce harmful emissions, modeling firms as risk averse would often result in incorrect adoption or diffusion rate estimates.[143] To the extent practicable and when appropriate, you should develop an analysis that takes risk aversion into account. The below paragraphs provide some guidance on how to account for risk aversion.

You should attempt to determine the risk preferences of the population impacted by your regulation when it is material to your analysis. As noted previously, risk aversion is widespread, and is consistent with common models of rational preferences.[144] Nevertheless, there are a variety of circumstances in which risk aversion may not be material to your analysis and you could appropriately assume risk neutrality. First, and perhaps most commonly, when a regulation has modest effects on each person or group that is affected, or when a regulation's net benefits are almost identical in different states of the world, it will often be reasonable to ignore risk preferences in your analysis because the consequences of incorporating them would be negligible. Second, when people are already fully insured against a risk or could choose to be so, regulations affecting that risk may not offer any additional insurance benefits (that is, value in excess of what would be estimated by assuming risk-neutrality) to the affected policyholders (or potential future policyholders).[145] As a result, when a regulation only addresses such risks, consideration of risk aversion may not be material to estimating the benefits and costs of the regulation. However—due to incomplete markets, the existence of uninsurable risks, and other distortions—full insurance may not be obtainable, and it is generally not appropriate to presume

[141] It is important to note that this guidance is not intended to preclude the use of any reasonable and appropriate assumptions about risk preferences suitable to your regulatory context.
[142] But there are various reasons why even risk-neutral firms may behave as if they are risk averse. *See* Louis Eeckhoudt, Christian Gollier, and Harris Schlesinger, "The No-Loss Offset Provision and the Attitude Towards Risk of a Risk-Neutral Firm," *Journal of Public Economics* 65, no. 2 (1997): 207-217.
[143] Firms may also be slow to adopt novel technologies for reasons other than risk aversion, such as first-mover disadvantages, loss aversion, etc.
[144] Charles A. Holt and Susan K. Laury, "Chapter 4 - Assessment and Estimation of Risk Preferences," in *Handbook of the Economics of Risk and Uncertainty*, eds. Mark J. Machina and W. Kip Viscusi (2014), 135-201.
[145] This result may not hold if the transaction costs of becoming fully insured are substantial.

the existence of full insurance unless there is evidence that it is present. In these circumstances, if your analysis takes a risk-neutral approach, you should explain why. Finally, as noted previously, while risk aversion is widespread, there may be contexts in which some people are risk-neutral or risk-seeking. If there is evidence that this is the case in a context that is relevant to your regulation, you should alter your analysis accordingly.[146] These three cases are not intended to be exhaustive.

When considering risk, it is critical to consider how uncertainty about a regulation's effects relates to the uncertainty about the baseline (or uncertainty that people are exposed to in the baseline). All else held equal, a regulation that has more beneficial effects when outcomes in the baseline are better, and less beneficial effects when outcomes in the baseline are worse, is worth relatively less than a regulation that has more beneficial effects when outcomes in the baseline are worse, and less beneficial effects when outcomes in the baseline are better. That is, due to diminishing marginal utility, a regulation with benefits that are positively correlated with baseline outcomes has a lower value than an otherwise identical regulation with benefits that are negatively correlated with baseline outcomes.

Certainty-equivalent valuations provide a useful tool for comparing different possible outcomes. For an uncertain benefit, the certainty-equivalent is the number of certain dollars that the uncertain benefit is worth to its recipient. A certainty-equivalent valuation can be thought of as the expected value of a benefit or cost less or plus a premium that reflects risk aversion. For example, suppose that a particular regulation reduces the probability of fire in a particular type of facility. As part of a benefit-cost analysis for this regulation, the dollar value of the expected reduction in fire losses might be calculated.[147] The owners of the protected facilities may place a higher dollar value on the lessening of risk of a fire than the expected dollar value of the loss. If so, it would be demonstrated by a willingness to pay for fire insurance in excess of the expected value of claims. Therefore, the facility owners' net cost (the difference between insurance premiums and expected value of insurance company claims payments) for fire insurance can be used to increase the value of expected loss from a fire to its certainty-equivalent value.

One way to incorporate risk aversion into a regulatory analysis is to directly determine individuals' certainty-equivalent valuations for relevant benefits or costs through their willingness to pay for (or willingness to accept) specific outcomes related to a regulation. In some cases, it may be possible to infer this valuation via revealed preference—using individuals' behaviors in markets—or other situations involving trade-offs, as discussed previously. Individuals' willingness to pay for insurance, for example, may be indicative of their valuation of the protection from a risk that may be achieved by regulatory intervention (in a related context for which insurance is not available). You may also be able to rely on stated preferences to

---

[146] You should be cautious before adopting an assumption that evidence supports risk-seeking behavior. For example, people who gamble—despite zero expected gains or even expected losses—may be both risk-averse and put a positive value the social or competitive aspect of their particular game. John Conlisk, "The Utility of Gambling," *Journal of Risk and Uncertainty* 6, no. 3 (1993): 255-275. Alternatively, those individuals may instead erroneously overrate their skill, or be addicted to gambling; see the section "*Behavioral Biases*" on accounting for such benefits and costs.

[147] Market conditions—especially availability of insurance, as noted above—would affect the relevance of the expected value of fire losses to a benefit-cost analysis, but for simplicity of explanation, such considerations are set aside in this illustrative example.

produce certainty-equivalent valuations. Both of these methods of eliciting certainty-equivalent valuations can be flawed, however, as individuals often display both decision-making and judgment biases when considering decisions that would generate small changes in the probabilities of low-probability events that have large costs when they occur.[148] For similar reasons, there are challenges in eliciting the willingness to pay to avoid risks that are unprecedented, or that primarily accrue to other people (*e.g.*, future generations).

Another approach is to translate the valuation of uncertain outcomes into certainty-equivalent valuations by modeling individual preferences, for example, using an assumed utility function. Under this approach, you would first estimate the distribution of possible outcomes, and then convert these estimates of outcomes into *ex ante* certainty-equivalent values using an appropriate utility function. One simple approach uses a constant elasticity utility function.[149] Other methods of incorporating risk aversion are also available. To allow for a distinction between risk aversion and the intertemporal elasticity of substitution, economists frequently employ Epstein-Zin preferences.[150] Similarly, you may determine that the assumption of constant relative risk aversion, implicit in the constant elasticity approach, is inappropriate in your context. As with other aspects of your regulatory analysis, you should balance thoroughness with practical constraints, including when deciding whether to calculate certainty equivalents or use other methods to value outcomes that are uncertain.

c. Alternative Inputs, Approaches, and Assumptions

If benefit or cost estimates depend heavily on particular inputs, approaches, or assumptions, it is often informative to make those details explicit and carry out sensitivity analyses using plausible alternatives. If the value of net benefits changes from positive to negative (or vice versa) or if the relative ranking of regulatory options changes with alternative plausible inputs, approaches, or assumptions, you should generally consider conducting further

---

[148] Colin F. Camerer and Howard Kunreuther, "Decision Processes for Low Probability Events: Policy Implications," *Journal of Policy Analysis and Management* 8, no. 4 (1989): 565-592.

[149] A constant elasticity utility function takes the form

$$u(i) = \begin{cases} \dfrac{i^{1-\varepsilon}}{1-\varepsilon} & \varepsilon \geq 0, \varepsilon \neq 1 \\ \ln(i) & \varepsilon = 1 \end{cases}$$

In this formula, i is an individual's income and ε is the absolute value of the elasticity of marginal utility. Consider a policy that increases or decreases income in one year by a factor α with probability p. This means that under the policy, income, i, is αi with probability p and i with probability $1-p$. The expected income resulting from the policy is $p\alpha i + (1-p)i$. To convert expected costs or benefits into certainty-equivalent costs or benefits, you can multiply the expected effect by the change in certainty-equivalent income relative to baseline divided by the expected change in income, which is equal to

$$\frac{[p\alpha^{1-\varepsilon} + (1-p)]^{\frac{1}{1-\varepsilon}} - 1}{p\alpha - p}.$$

OMB provides a default estimate of the absolute value of the elasticity of marginal utility of 1.4 for use in income-weighted benefit-cost analysis. (See the section "*Distributional Effects*" for more discussion of income-weighted benefit-cost analysis.) The constant elasticity utility function uses the same parameter to value the aversion to uncertain outcomes and aversion to inequality across a population, but empirical estimates of risk aversion vary, and different values may be appropriate in different regulatory contexts.

[150] *See* Larry G. Epstein and Stanley E. Zin, "Substitution, Risk Aversion, and the Temporal Behavior of Consumption and Asset Returns: An Empirical Analysis," *Journal of Political Economy* 99, no. 2 (1991): 263-286.

analysis to inform the determination of which of the alternatives is more appropriate. Because different estimation methods may embed different assumptions, you may find it helpful to analyze estimation methods carefully to make any hidden assumptions explicit.

12. Discount Rates

Benefits and costs often take place in different time periods. When this occurs, simply adding all of the expected benefits or costs without regard for when they actually occur fails to account for differences in those values that result from the differences in timing. If benefits or costs are delayed or otherwise separated in time from each other, the difference in timing should be reflected in your analysis through appropriate discounting.

As a first step, you should present the undiscounted annual time stream of benefits and costs expected to result from a regulation, clearly identifying when they are expected to occur.

To avoid the misleading effects of inflation in your estimates, it is important to measure the stream of effects in constant dollars. If the benefits and costs are initially measured in prices reflecting expected future inflation, you can convert them to constant dollars by using an appropriate inflation index that corresponds to the affected markets.[151]

a. The Rationale for Discounting

All future effects, regardless of what form they take (*e.g.*, changes to consumption, health, environmental amenities, etc.), should be discounted to reflect changes in valuation of impacts across time. The present value of an impact depends on the timing of the impact and the appropriate discount rate. Benefits or costs that occur sooner are generally understood to be more valuable, all else equal. The main rationales for the discounting of future impacts are:

(a) If consumption continues to increase over time—as it has for most of U.S. history—an increment of consumption will be less valuable in the future than it would be today (all else equal); as total consumption increases, the value of a marginal unit of consumption declines.
(b) People may exhibit "pure time preference," meaning that even in the absence of future changes in consumption, people may rationally prefer consumption now rather than later.
(c) In addition, regulations that displace or induce capital investments at a point in time can affect future consumption differently than regulations that increase or decrease consumption at a point in time (see the discussion in the section "*Accounting for Effects on Capital*").

Somewhat different considerations apply in the context of discounting long-term effects, as explored further in the section "*Long-Term Discounting*" below. Several reasonable

---

[151] Please note any conversion into constant dollars is a separate calculation from discounting future effects to present value, as described below.

approaches to discounting are presented in this section.[152]

b. Discounting in General

A discount factor is used to adjust the estimated benefits and costs of a regulation for differences in timing. The further in the future the effects are expected to occur, the more they are discounted. If the discount rate is constant, the discount factor for a particular year can be calculated as $1/(1 + \text{the discount rate})^t$ where "t" measures the number of years[153] in the future that the benefits or costs are expected to occur. Effects that have been adjusted in this way are called "discounted present values" or simply "present values." Only when the estimated benefits and costs have been discounted can effects occurring across different time periods be added together to determine the overall present value of net benefits.

In your analysis, it is advisable to carefully consider the types of effects that need to be discounted. Depending on the effects that you are analyzing, you may be discounting using rates reflecting either society's perspective or a private entity's perspective. The social rate of time preference corresponds to the rate at which society is willing to trade current consumption for future consumption. However, you may be estimating underlying private behavioral changes that inform estimates of the effects of your regulation. Modeling private behaviors requires the use of appropriate private discount rates faced by the relevant populations. When estimating private discount rates, ideally the appropriate distribution of rates faced by affected populations should be considered. You should consider if readily available market rates are appropriate approximations of private discount rates. Once necessary private behaviors are modeled, then the social discount rate can be applied to ascertain the social welfare effects (benefits and costs) of a regulation. The guidance below generally pertains to society's perspective rather than private entities' perspective.

The real (inflation-adjusted) rate of return on long-term U.S. government debt provides a fair approximation of the social rate of time preference. It is the rate available on riskless personal savings and is therefore a rate at which individuals may increase future consumption at the expense of current consumption. It is also the rate at which society as a whole can trade current consumption for future consumption.[154]

Over the last thirty years,[155] this rate has averaged around 2.0 percent per year in real terms on a pre-tax basis. OMB arrives at this figure by considering the 30-year average of the yield on 10-year Treasury marketable securities:[156]

---

[152] For more detail on rationales for and approaches to discounting, see Office of Management & Budget, *OMB Circular No. A-4: Explanation and Response to Public Input* (Nov. 9, 2023), https://www.whitehouse.gov/wp-content/uploads/2023/11/CircularA-4Explanation.pdf.
[153] For simplicity, units of whole years are typically used.
[154] Depending on assumptions about the mechanisms by which, for example, the government shifts the timing of consumption.
[155] As of the time of this Circular's writing, these thirty years cover 1993 through 2022.
[156] For more details on the selection of data and methodology, see Office of Management & Budget, *OMB Circular No. A-4: Explanation and Response to Public Input* (Nov. 9, 2023), https://www.whitehouse.gov/wp-content/uploads/2023/11/CircularA-4Explanation.pdf.

- the yield on 10-year Treasury Inflation Protected Securities (TIPS)—which measure inflation using the consumer price index (CPI)—over the period they have been available (as of this writing, 2003 to 2022) and
- the yield on 10-year Treasury notes minus the average annual rate of change in the CPI for the years when TIPS were not available, (as of this writing, 1993 to 2002).[157]

This approach produces (as of this writing) a real rate of 1.7 percent per year, to which OMB adds a 0.3 percent per-year rate to reflect inflation as measured by the personal consumption expenditure (PCE) inflation index (rather than CPI). The result is an estimate of the social rate of time preference of 2.0 percent per year. Updates to this estimate, using this formula, will be published every three years in the Appendix to this Circular.[158]

For simplicity, transparency, and tractability, OMB is setting one default rate for social rate of time preference for all effects from the present through thirty years into the future, rather than a more elaborate discount rate schedule.[159] Corresponding discount factors over this period of thirty years are available in an Appendix to this Circular. For the longer term, see the section "*Long-Term Discounting*" below.

There are other appropriate approaches to discounting.[160] For example, you may also analyze the welfare effects of your regulation in an economic model in which the evolution of the discount rates is endogenous. If you take such an approach to discounting, a number of assumptions need to be made in order to inform the selection of parameter values. Consequently, any agency that wishes to use alternative approaches to discounting should confer with OMB before proceeding.

c. Accounting for Effects on Capital

Regulations that displace or induce capital investments at a point in time may affect present and future consumption differently than regulations that increase or decrease consumption at a point in time. This arises because the return on capital need not equal the social rate of time preference, as taxes on capital, other economic distortions, risk premia, and missing markets can create a sustained divergence between these rates of return and among rates of

[157] The 2003 version of this Circular similarly estimated the social rate of time preference using a 30-year average of 10-year Treasury notes less the average annual rate of change in the CPI. OMB believes that 10-year Treasury Inflation Protected Securities, which were not an available measure in 2003, provide a more accurate measure of the real (inflation-adjusted) return of 10-year Treasury notes.
[158] Agencies may generally continue to refer to the discount rate estimate in the version of the Appendix in effect at the time that a regulatory analysis for a proposed regulation is received by OMB, even if the Appendix is updated before the regulation is finalized. However, if the Appendix has been updated more than once since the proposed regulation was received by OMB, agencies should refer to the most recent version of the Appendix.
[159] Thirty years matches the term of the longest-duration Treasury bond, and therefore the limit on directly observed interest rates on long-term U.S. government debt. Beyond this point, it becomes more important to allow for dynamic rates, as the effect of "[u]ncertainty about future interest rates … does not 'kick in' until we are out of the range of a near-future period within which we can feel confident projecting forward today's relevant interest rates." Martin L. Weitzman, "Just Keep Discounting, but…" in *Discounting and Intergenerational Equity*, eds. Paul R. Portney and John P. Weyant (New York: Resources for the Future, 1999), 23-29.
[160] They may be particularly appropriate when regulations have general equilibrium effects that affect the appropriate discount rate. See the section "*Partial and General Equilibrium Analysis*" for more details.

return to different capital. Such distortions may include, for example, returns to capital investments stemming from unpriced social externalities or market power.[161] This divergence can persist despite the tendency for capital to flow to where it can earn the highest rate of return.

The analytically preferred method of handling temporal differences between benefits and costs is to adjust all the benefits and costs to reflect their value in equivalent units of consumption before discounting them. This approach to discounting is sometimes called the "shadow price" approach, because doing such calculations requires you to value benefits and costs using shadow prices, especially for capital goods, to correct for market distortions. Shadow prices are notional, unobserved prices that reflect the social opportunity cost of an activity.

Analyzing a regulation using a shadow price of capital approach—converting benefits and costs into consumption-equivalent values before discounting—is generally preferred if a shadow price appropriate for the regulatory context can be approximated and the incidence of regulatory effects on capital can be estimated.[162] However, this often may not be feasible: a shadow price specific to the regulatory context may not be well established, or the distribution of impacts from the regulation on capital and consumption may not be readily quantifiable. In such cases, you may wish to consider an appropriate range of shadow prices.

When substantial incidence on capital is anticipated, as a default, OMB recommends consideration of a lower value of 1.0, reflecting an economy with perfect capital mobility, *i.e.*, an open economy estimate (which, when applied to your analysis, will result in no change to your estimates of benefits and costs discounted at the social rate of time preference),[163] and a high

---

[161] While such considerations may or may not be relevant to private preferences for trading off present versus future consumption (sometimes called private discount rates), they are generally not relevant to social discount rates. *See* Council of Economic Advisers, *Discounting for Public Policy: Theory and Recent Evidence on the Merits of Updating the Discount Rate* 4 (Jan. 2017) ("Market rates also reflect risks faced in the private sector, which may not be relevant for public sector evaluation. In addition, private returns that involve unpriced externalities or monopoly rents will likely be higher than the true social return.").

[162] In some particular cases, it may be appropriate to assume a shadow price of approximately one or that regulatory effects are not likely to significantly displace or induce investment. When you have reason to make such an assumption, conversion of benefits and costs to consumption-equivalent values may be unnecessary, as the benefits and costs can be discounted with the social rate of time preference. Factors contributing to such a situation may include the substantial availability of foreign funds, and the contribution of risk and economic rents (such as those accruing to market power) to the spread between the risk-free rate and the average private return to capital. Conversely, accounting for the incidence of effects on capital may be especially important when there is reason to believe that the appropriate shadow price of capital is not one, and the time horizon of regulatory analysis is short or the uncertainty about the incidence of the regulation's effects on natural, human, or physical capital is large.

[163] Robert C. Lind, "Reassessing the Government's Discount Rate Policy in Light of New Theory and Data in a World Economy with a High Degree of Capital Mobility," *Journal of Environmental Economics and Management* 18, no. 2 (1990): S–8-S–28; Jonathan A. Lesser and Richard O. Zerbe, "Discounting Procedures for Environmental (and Other) Projects: A Comment on Kolb and Scheraga," *Journal of Policy Analysis and Management* 13, no. 1 (1994): 140-156 (building on Robert C. Lind, "Reassessing the Government's Discount Rate Policy in Light of New Theory and Data in a World Economy with a High Degree of Capital Mobility," *Journal of Environmental Economics and Management* 18, no. 2 (1990): S–8-S-28, and concluding: "Private capital in an open economy comes primarily at the expense of consumption, not from crowding out other private capital. Thus, even where private funds are involved, the SPC [shadow price of capital] approach would use the consumer's rate of time preference in an open economy.").

value of 1.2, reflecting a closed economy estimate with no foreign capital flows.[164] If the incidence of benefits and costs falling on capital are not directly estimated, one approach is to test your analysis's sensitivity to assumptions about the incidence of regulatory effects on capital by analyzing two outer-bound cases: one assuming all benefits and no costs fall on capital, and another assuming all costs and no benefits fall on capital, as lower- and upper-bound estimates of the effect of capital on your estimate of net benefits. An example of such sensitivity analyses is presented in the footnote below.[165] This approach can be useful to regulatory analysis, but does not suggest that agencies should consider the ratio of benefits to costs—as opposed to net benefits—when analyzing regulatory alternatives, as noted in the section "*Benefit-Cost Analysis*." Rather, this approach suggests circumstances in which agencies may consider additional steps, such as more detailed discussions or, to the extent feasible, estimation of an appropriate shadow price of capital or of the likely incidence of regulatory effects on capital in a particular regulatory context. Alternatively, as noted previously, accounting for shadow prices can also be done endogenously in a well-calibrated general equilibrium model.

In certain cases, it may be clear that that your regulation likely has little or no incidence on capital,[166] or the magnitudes of costs falling on capital and benefits falling on capital are the same in every period.[167] In such cases, you can simply discount at the social rate of time

[164] Richard G. Newell, William A. Pizer, and Brian C. Prest, "The Shadow Price of Capital: Accounting for Capital Displacement in Benefit-Cost Analysis," (Working Paper No. 31526, National Bureau of Economic Research, August 2023), https://www.nber.org/papers/w31526 (citing Qingran Li and William A. Pizer, "Use of the Consumption Discount Rate for Public Policy over the Distant Future," *Journal of Environmental Economics and Management* 107 (2021): 102428). *See also* Jonathan A. Lesser and Richard O. Zerbe, "Discounting Procedures for Environmental (and Other) Projects: A Comment on Kolb and Scheraga," *Journal of Policy Analysis and Management* 13, no. 1 (1994): 140-156; Mark A. Moore et al., "'Just Give Me a Number!' Practical Values for the Social Discount Rate," *Journal of Policy Analysis and Management* 23, no. 4 (2004): 789-812.

[165] For example, if a regulation has $100 million in costs in the first year, and $50 million in benefits for five years, the analysis with a shadow price equal to 1.0 is unchanged (values in millions, discounted at 2.0% in parentheses):

	Year 1	**Year 2**	**Year 3**	**Year 4**	**Year 5**
Benefits	$50 ($49.0)	$50 ($48.1)	$50 ($47.1)	$50 ($46.2)	$50 ($45.3)
Costs	$100 ($98.0)	$0 ($0)	$0 ($0)	$0 ($0)	$0 ($0)

Assuming a shadow price of 1.0, discounted net benefits would be about $137.6 million. You could then consider a case where 100% of benefits fall on capital and 0% of costs fall on capital, and the shadow price is 1.2 (values in millions, discounted at 2.0% in parentheses):

	Year 1	**Year 2**	**Year 3**	**Year 4**	**Year 5**
Benefits	$60 ($58.8)	$60($57.7)	$60 ($56.5)	$60 ($55.4)	$60 ($54.3)
Costs	$100 ($98.0)	$0 ($0)	$0 ($0)	$0 ($0)	$0 ($0)

In this outer-bound case, discounted net benefits would be about $184.8 million. And, conversely, you could consider a case where 0% of benefits fall on capital and 100% of costs fall on capital, and the shadow price is 1.2 (values in millions, discounted at 2.0% in parentheses):

	Year 1	**Year 2**	**Year 3**	**Year 4**	**Year 5**
Benefits	$50 ($49.0)	$50 ($48.1)	$50 ($47.1)	$50 ($46.2)	$50 ($45.3)
Costs	$120 ($117.6)	$0 ($0)	$0 ($0)	$0 ($0)	$0 ($0)

In this outer-bound case, discounted net benefits would be about $118.0 million. More precise estimates of the incidence of effects on capital and consumption are preferable to these outer-bounds analyses, if available.

[166] This happens if a regulation is unlikely to significantly impact private investment rather than consumption, such as when regulatory costs will predominantly be passed through to consumers and do not affect investment decisions.

[167] Mark A. Moore et al., "'Just Give Me a Number!' Practical Values for the Social Discount Rate," *Journal of Policy Analysis and Management* 23, no. 4 (2004): 792 (citing Jonathan A. Lesser and Richard O. Zerbe, "Discounting Procedures for Environmental (and Other) Projects: A Comment on Kolb and Scheraga," *Journal of Policy Analysis and Management* 13, no. 1 (1994): 140-156).

preference.

d. Long-Term Discounting

Special ethical considerations arise when comparing benefits and costs across generations. Although most people demonstrate time preference in their own consumption behavior, which may vary by the good or service at hand, it may not be appropriate for society to demonstrate a similar preference when deciding between the well-being of current and future generations. Future citizens and residents who are affected by such choices cannot take part in making them, and today's society must act with some consideration of their interest.

Some believe that it is ethically impermissible to discount the utility of future generations.[168] That is, government should treat all generations equally. Even under an approach that does not discount the utility of future generations, it is often appropriate to discount long-term consumption benefits and costs—although at a lower rate than the near-term effects more likely to fall on a single generation—if there is an expectation that future generations will be wealthier and thus will value a marginal dollar of benefits or costs by less than those alive today, or if there is a non-zero probability of sufficiently catastrophic risks. To account for these special ethical considerations, an extensive literature uses a "prescriptive" approach to long-term discounting, determining the appropriate degree of weight that society should place on the welfare of future generations.

A distinct reason for discounting the benefits and costs accruing to future generations at a lower rate is uncertainty about the appropriate value of the discount rate.[169] Private market rates provide a reasonably reliable reference for determining the rate at which society is willing to trade consumption over time within a few decades, but for extremely long time periods no comparable private rates exist. Because future changes in the social rate of time preference are uncertain but correlated over time, the certainty-equivalent discount rate will have a declining schedule.[170] The appropriate discount rate declines because it is the average of the cumulative discount factors, not an average of the discount rates, that matters.[171]

There are various reasonable approaches to long-term discounting that account for uncertainty and other relevant factors, and therefore lead to dynamic discount rates over time. One approach uses data from historical interest rates in financial markets to project uncertainty in the future path of such rates. This approach is a way of extending the use of financial market data to determine the discount rate in the long-term. OMB has provided a default schedule of long-term discount rates in the Appendix using a model that takes this approach, which will be

---

[168] *See, e.g.*, Derek Parfit, *Reasons and Persons* (Oxford: Oxford University Press, 1984); Frank P. Ramsey, "A Mathematical Theory of Saving," *Economic Journal* 38, no. 152 (1928): 543-559.
[169] *See* Kenneth J. Arrow et al., "Should Governments Use a Declining Discount Rate in Project Analysis?," *Review of Environmental Economics and Policy* 8, no. 2 (2014): 145-163.
[170] Uncertainty about long-term growth rates can also be understood as causing a precautionary response to save more for the future, and increased rates of savings correspond to a lower discount rate. *See* Maureen L. Cropper et al., "Declining Discount Rates," *American Economic Review* 104, no. 5 (2014): 538-543.
[171] Martin L. Weitzman, "Why the Far-Distant Future Should Be Discounted at Its Lowest Possible Rate," *Journal of Environmental Economics and Management* 36, no. 3 (1998): 201-208.

updated every three years.[172]

Another approach is to explicitly use an economic model for welfare analysis to endogenously generate a discount rate schedule tailored to the regulatory context.[173] When taking this alternative approach, agencies should report information on their discount rate schedule in order to provide useful information to the public.

e. The Relationship between Discounting and Risk

As discussed in the section "*Economic Values of Uncertain Outcomes*," you should endeavor to estimate certainty equivalents[174] when risk is material to your analysis. This approach is favored over the use of higher discount rates as a means of accounting for risk due to its potential for greater accuracy. Simple examples illustrate the point: using a higher discount rate to account for risk would be inappropriate when evaluating regulations that reduce "systematic" risk (meaning that they have higher net benefits when other societal outcomes are worse, and vice versa); accounting for this risk reduction would be akin to using a lower, not higher, discount rate. Investments in pandemic preparedness could fall in this category. Conversely, for a regulation that increases risk (meaning that it has lower net benefits when outcomes are worse, and vice versa), accounting for risk through certainty equivalents could be mathematically equivalent to the use of a higher discount rate. For an example of when the two could be mathematically equivalent, the use of a stock market-based (or stock and bond market-based) discount rate could be equivalent to the use of certainty-equivalent valuations for regulations relating to pension funding, or when a regulation induces investment that closely mimics the risk profile of private sector investment (such as programs that provide debt financing to businesses). However, as a general matter, using discount rates to account for risk requires rigid assumptions about the form that risks take over time, and therefore creates the potential for increased inaccuracy relative to the certainty equivalents approach.[175]

In cases where risk is material to the regulation, you should generally account for relevant risk in your regulatory analysis explicitly. When you do not account for risk— either the "idiosyncratic" risks that are the primary focus of the section "*Economic Values of Uncertain Outcomes*" or "systematic" risk as discussed in this section—in your monetized estimates of benefits or costs, you should treat risk as a non-monetized effect. *See* "*Methods for Treating Non-Monetized Benefits and Costs*" for more details.

While use of certainty equivalents is the preferred method of accounting for risk, you

---

[172] See the Appendix and Office of Management & Budget, *OMB Circular No. A-4: Explanation and Response to Public Input* (Nov. 9, 2023), https://www.whitehouse.gov/wp-content/uploads/2023/11/CircularA-4Explanation.pdf, for more details on rationale and methodology for the default schedule of long-term rates.
[173] For example, the Ramsey model. *See, e.g.*, Richard G. Newell, William A. Pizer, and Brian C. Prest, "A Discounting Rule for the Social Cost of Carbon," *Journal of the Association of Environmental and Resource Economists* 9, no. 5 (2022): 1017-1046; Kevin Rennert et al., "The Social Cost of Carbon: Advances in Long-Term Probabilistic Projections of Population, GDP, Emissions, and Discount Rates," *Brookings Papers on Economic Activity* (Fall 2021).
[174] Other methods to incorporate risks into your analysis may also be useful.
[175] Anthony E. Boardman et al., *Cost-Benefit Analysis: Concepts and Practice*, 5th ed. (Cambridge: Cambridge University Press, 2018), 263.

may choose to account for systematic risk using a risk-adjusted discount rate. One approach is to estimate an economy-wide systematic risk premium and the regulation-specific correlation of regulatory benefits and costs with that systematic risk—either positive or negative—combining the two to obtain a regulation-specific discount rate.[176] For example, Circular No. A-94 provides a method for risk-adjusted discounting in benefit-cost analysis of Federal programs. These methods imply a risk premium of 2.5% and a correlation factor of 0.45 for relevant programs. These values, under a risk-free rate of 2.0%, imply a risk-adjusted discount rate of 3.1%.[177] Any agency that wishes to account for risk using alternative discount rates in primary or sensitivity analyses should provide specific justification for their approach, and should confer with OMB before proceeding.

f. Time Preference for Non-Monetized Benefits and Costs

Differences in timing should be accounted for through discounting even for benefits and costs that are not expressed in monetary units, including health benefits.

Alternatively, it may be possible in some cases to avoid discounting non-monetized benefits. If the expected flow of benefits begins as soon as the cost is incurred and the flow of benefits is expected to be constant over time, then annualizing the cost stream is sufficient, and further discounting of benefits is unnecessary as annualized benefits and annual benefits are the same.

13. Quality, Objectivity, Transparency, and Reproducibility of Results

Pursuant to the Information Quality Act (Public Law 106-554),[178] OMB has issued *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility and Integrity of Information Disseminated by Federal Agencies* ("Guidelines").[179] The Guidelines describe expectations for pre-dissemination review[180] of the quality of information disseminated by Federal agencies (as is relevant here, your regulatory analysis, including the underlying data). During your pre-dissemination review of your regulatory analysis, you should ensure objective presentation of the analysis and consider the appropriate level of information quality for your

---

[176] However, the parameters necessary to pursue this approach can be difficult to estimate, the approach inherently offers limited flexibility in modeling changes to risk over time (*e.g.*, it is only valid if uncertainty grows exponentially over time), and this type of risk is not always the most material type of risk in regulatory analysis. Note that for many regulations, an appropriate risk premium adjustment to the discount rate would be negligible (or negative), as many regulations provide their largest value to society when mitigating the harms of a number of risks or market inefficiencies in bad states of the world. (By contrast, the benefits of many Federal investments are positively correlated with future economic outcomes.) Accordingly, this Circular does not broadly recommend this approach in regulatory analysis at this time.

[177] That is, $2.0\% + 0.45 \times 2.5\% = 3.13\%$. Office of Management & Budget, Circular No. A-94, *Guidelines and Discount Rates for Benefit-Cost Analysis of Federal Programs* Appendix D (Nov. 9, 2023), https://www.whitehouse.gov/wp-content/uploads/2023/11/CircularA-94.pdf.

[178] Information Quality Act, 44 U.S.C. 3516 note.

[179] Office of Management & Budget, *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies; Republication*, 67 Fed. Reg. 8452 (Feb. 22, 2002).

[180] Pre-dissemination review, as it applies to regulatory analyses, refers to the process used by agencies to evaluate whether information quality is consistent with the planned use for it, prior to making the information public or using it as a basis for a policy decision.

AR_003193

specific regulatory analysis based on the likely use of that information.

The Guidelines explain that quality encompasses utility, integrity, and objectivity. Objectivity refers to whether the disseminated information is accurate, reliable, and unbiased as a matter of presentation and substance. The focus on the information's usefulness is critical; the Guidelines recognize that some government information may need to meet higher or more specific quality standards than those that would apply to other types of government information, due to the information's expected use. For this reason, the Guidelines characterize a subset of agency information as "influential," which is subject to certain requirements.

Under the Guidelines, information is influential if "the agency can reasonably determine" that it "will have or does have a clear and substantial impact on important public policies or important private sector decisions." In the context of a policy decision, a specific piece or body of information is "influential" when it is a principal basis for a decision by a Federal policymaker—that is, if the same decision would be difficult to reach in the information's absence or if the decision would lose its fundamental scientific, financial, or statistical underpinnings absent the information. Even if a decision is very important, a particular piece of information supporting it may or may not be "influential," depending on whether the decision could be reached in the information's absence.

Because of its potentially influential nature and special role in the rulemaking process, it is appropriate to set minimum quality standards for regulatory analysis. Each agency is authorized to define whether its regulatory analyses, or the information contained within such analyses, is likely to be "influential" given the nature of the issues for which the agency is responsible and the particular analysis in question. The Guidelines include a "reproducibility standard" for influential information such that, absent compelling interests,[181] agencies should generally disseminate their influential analyses with sufficient descriptions of data and methods to allow them to be reproduced by qualified third parties who may want to test the sensitivity of agency analyses.

When the regulatory analysis is driven by scientific information, that scientific information may be influential itself, and thus OMB's *Final Information Quality Bulletin for Peer Review* (Bulletin) would apply. The Bulletin includes guidance on the selection of reviewers, the appropriate mechanism for peer review, the importance of providing explicit instructions to reviewers (*i.e.*, a peer review charge), the transparency of the agency's review plans, and the expectations regarding the resolution and dissemination of peer reviewer comments.

A good analysis is transparent in its methods, data sources, and analytic choices. Not only is a good analysis designed to inform policymakers, other government stakeholders, and the public about the effects of alternative actions, but transparency is also integral to the concept of reproducibility of regulatory analysis. Consistent with the expectations in the academic literature, a qualified third party reading the analysis should be able to understand your analysis, underlying

[181] In this Circular, consistent with the Guidelines, the term "compelling interests" includes, but is not limited to, policies related to protecting the privacy of persons, confidentiality of data, intellectual property, national or homeland security, scientific integrity, and cost to the government.

assumptions, and the way in which you developed your estimates. There may be situation-specific challenges related to conveying some types of information, but best effort should be made within the scope of the analysis. Regulatory analyses subject to this Circular should provide documentation that the analysis reflects the highest quality evidence (including scientific, technical, economic, and indigenous knowledge[182]) and analytical methods, as feasible and appropriate, and consistent with Federal policies for evidence building and information quality.

Since the Guidelines were originally published in 2002, Federal data access policies have been promulgated to both increase taxpayer return on Federal investment and to spur private sector innovation.[183] These Federal data access policies, in conjunction with responsibilities under the Guidelines mean that reproducibility requires more than simply documenting sources used. For example:

- The underlying data that are pivotal to the conclusions of the regulatory analysis should be made available to the public absent compelling interests.[184]
- When results are generated by, for instance, a statistical model or machine-augmented learning, reproducibility generally requires, at minimum, transparency about the specific methods, design parameters, equations or algorithms, parameters, and assumptions used.
- When an agency has performed an analysis using a specialized set of computer code, the computer code used to process it should be made available to the public for further analysis, if consistent with applicable law and policy. When appropriate and feasible, this code should be written in a programming language that does not require a commercial license.

---

[182] Many types of original information exist. For example, local or affected communities may possess important original scientific, technical, or economic information—including, but not limited to, indigenous knowledge—that is relevant to your analysis. *See* Office of Science and Technology Policy and Council on Environmental Quality, *Guidance for Federal Departments and Agencies on Indigenous Knowledge* (2022), https://whitehouse.gov/wp-content/uploads/2022/12/OSTP-CEQ-IK-Guidance.pdf, for information on how to foster collaboration with Tribal Nations and knowledge holders so that indigenous knowledge can inform evidence-based Federal government decision-making, where appropriate.
[183] *See, e.g.*, the Open, Public, Electronic, and Necessary (OPEN) Government Data Act, Pub. L. No. 115-435, 132 Stat. 5534 (2019) (Title II of the Foundations for Evidence-Based Policymaking Act of 2018). Office of Management & Budget, Circular No. A-130, *Managing Information as a Strategic Resource* (July 28, 2016), requires agencies to collect and create information in a way that supports public transparency as well as downstream, secondary information dissemination and processing by third parties, thereby making government information accessible, discoverable, and usable.
[184] *See* footnote 181 above for examples of compelling interests. Cutting-edge technologies reduce the risk of re-identification and therefore may mitigate certain privacy risks associated with providing access to the data underlying regulatory analysis. Risk reduction techniques include creating multiple versions of a single dataset with varying levels of specificity and protection (sometimes referred to a "tiered access"). Public access data sets are the lowest tier, whereas access to the most restricted versions is limited to authorized researchers. To maintain confidentiality, less restricted "middle tier" versions of datasets typically reduce specificity or granularity in exchange for easier access that allows users to replicate statistical analyses and explore sensitivity of conclusions to alternative assumptions without having access to the original data file that includes personally identifiable information. *See, e.g.*, Advisory Committee on Data for Evidence Building, *Advisory Committee on Data for Evidence Building: Year 2 Report* (October 14, 2012), https://www.bea.gov/system/files/2022-10/acdeb-year-2-report.pdf.

Agencies should refer to the most recent best practices[185] regarding how and where to provide electronic access to their analysis, including all the supporting documents, so the public can easily access this material. Because one purpose of a regulatory analysis is to inform the public regarding the potential impacts of a proposed or final rule, it is critical that such documentation be made available promptly and reliably for public review and comment during the proposed or interim final phase of the rulemaking process and for public review when the rule is final.[186] Where other compelling interests prevent the public release of data or key elements of the analysis, certain generally-recommended practices (*e.g.*, robustness checks and sensitivity analyses and their documentation) should be performed in an especially rigorous manner.

Agencies should, whenever feasible and appropriate, disclose the use of outside consultants and the nature of their contributions.

14. Specialized Analytical Requirements

In preparing analysis of your regulation, you should be aware that there are a number of analytic requirements imposed by law. When developing a regulatory analysis consistent with the requirements of Executive Order 12866 (as amended),[187] you should also consider whether your regulation will need specialized analysis.

The differences across the various analyses listed below can create practical challenges but also offer opportunities for enhanced understanding of the available evidence and how it can be quantitatively compiled. For instance, if small entities experience the most direct effects of a regulation, an Initial Regulatory Flexibility Analysis may be an intuitive starting point for generating the suite of required assessments. Then, when you broaden the analytic perspective to be society-wide, in order to conduct a regulatory analysis consistent with Executive Order 12866, you may find that some benefits or costs experienced by small entities are accompanied by offsetting benefits or costs experienced by other entities and thus are often transfers of value within society (that is, they do not affect aggregate societal benefits or costs).[188] For example, grant funding received by small business, small non-profit, or small government entities from the

[185] For instance, Section 2 of Executive Order 13563 directs agencies (to the extent feasible and permitted by law) to give the public timely online access to the rulemaking docket on Regulations.gov, including relevant scientific and technical findings. For proposed rules, agencies are required to include an opportunity for public comment on the rulemaking docket, including comment on relevant scientific and technical findings. Examples of supporting materials include notices, significant guidance, environmental impact statements, regulatory impact analyses, and information collections. *See* Exec. Order No. 13563 of Jan. 18, 2011 (Improving Regulation and Regulatory Review), 76 Fed. Reg. 3821 (Jan. 21, 2011).

[186] For example, disseminating regulatory analyses and other supporting documents simultaneously with disseminating a proposed or final rule—for example, on the agency's website—prior to sending the rule to the Federal Register. Because weblinks can become broken over time, regulatory analyses and associated materials should be made available in regulatory dockets, even when also published on agency websites.

[187] Reaffirmed and elaborated upon in Executive Orders 13563 and 14094.

[188] Further related discussion appears in the "*Scope of Analysis*" and "*Transfers*" sections above. Moreover, distributional effects may be relevant in such an analysis; see the section "*Distributional Effects*" for more details on how to account for such effects.

Federal government would often be a transfer of value within society.[189]

Specialized analytic requirements are sometimes prescribed by statute. Some examples include:

a. Impact on Small Businesses and Other Small Entities

Under the Regulatory Flexibility Act (5 U.S.C. chapter 6), agencies must prepare an initial and final "regulatory flexibility analysis" (RFA) if the rulemaking could "have a significant economic impact on a substantial number of small entities." In this case, "significant" is context dependent, and is not necessarily the same standard as used to determine "significant" for Executive Order 12866 review. You should post your RFA on the internet so the public can review your findings.

Your agency should have guidelines on how to prepare an RFA and you are encouraged to consult with the Chief Counsel for Advocacy of the Small Business Administration on expectations concerning what is an adequate RFA. Under the Small Business Regulatory Enforcement Fairness Act of 1996, as amended, the Environmental Protection Agency, Occupational Safety and Health Administration, and Consumer Financial Protection Bureau are required to consult with small entities prior to developing a proposed rule that would have a significant effect on a substantial number of such entities.

b. Analysis of Unfunded Mandates

Under the Unfunded Mandates Reform Act of 1995 (2 U.S.C. 1532), you must prepare a written statement about benefits and costs prior to issuing a proposed or final rule (for which your agency published a proposed rule) that may result in aggregate expenditure by State, local, and Tribal governments, or by the private sector, of $100,000,000 or more in any one year (adjusted annually for inflation since enactment). Analytic concepts under Executive Order 12866 are generally similar to the "written statement" analytic concepts under the Unfunded Mandates Reform Act, and thus an analysis produced pursuant to Executive Order 12866 will usually satisfy the analytic requirements for a written statement under the Unfunded Mandates Reform Act. For intergovernmental mandates, the assessment should also include an analysis of "the extent to which there are available Federal resources to carry out the intergovernmental mandate."

c. Information Collection, Paperwork, and Recordkeeping Burdens

Under the Paperwork Reduction Act of 1995 (44 U.S.C. 3501–3520), you will need to consider whether your regulatory action will create any additional information collection,

---

[189] As another example of the interaction between various analyses, estimating the effects of a new regulation may bring to light data that would also be relevant to updating past estimates of the effects of related earlier actions. Performing such updates would serve the goal of keeping a running tally of paperwork burden, in accordance with the Paperwork Reduction Act; however, for analysis as set forth in Executive Order 12866 (among numerous others listed below), the focus should be on effects attributable to the new regulation.

paperwork, or recordkeeping burdens. These burdens are permissible only if you can justify the practical utility of the information for the implementation of your regulatory action. OMB approval will be required of any new requirements for a collection of information imposed on 10 or more persons[190] and a valid OMB control number must be obtained for any covered paperwork. Your agency's Chief Information Officer (CIO) should be able to assist you in complying with the Paperwork Reduction Act.

d. Information Quality Guidelines

Under the Information Quality Act, agency guidelines, in conformance with the OMB government-wide guidelines, have established basic quality performance goals for all information disseminated by agencies, including information disseminated in support of proposed and final rules. The data and analysis that you use to support your regulation must meet these agency and OMB quality standards; see the section "*Quality, Objectivity, Transparency, and Reproducibility of Results*" for more information. Your agency's CIO should be able to assist you in assessing information quality. The Statistical and Science Policy Branch of OMB's Office of Information and Regulatory Affairs can provide you with assistance. This Circular defines OMB's minimum quality standards for regulatory analysis.

e. National Environmental Policy Act

The National Environmental Policy Act (NEPA, 42 U.S.C. 4321 – *et seq*.) and related statutes, regulations, and executive orders require agencies to consider the environmental impacts of certain agency decisions, including regulations. Unless a rulemaking is exempt from NEPA, you must complete the required NEPA documentation at the required time. The White House Council on Environmental Quality has issued regulations (40 C.F.R. 1500 *et seq*.) and associated guidance for implementation of NEPA.

Specialized analytic requirements are also sometimes prescribed by Executive Order. Some examples include:

f. Health and Environmental Impacts on Communities with Environmental Justice Concerns

Under Executive Order 14096, "Revitalizing Our Nation's Commitment to Environmental Justice for All" (which builds upon Executive Order 12898[191]) agencies must, as appropriate and consistent with applicable law, identify, analyze, and address the disproportionate and adverse human health and environmental effects (including risks) and hazards of rulemaking actions and other Federal activities on communities with environmental

[190] "Persons" under the Paperwork Reduction Act refers to any members of the public, including non-U.S. citizens, residences, and businesses. The 10-person maximum may be lowered if the entities represent the majority or all of a sector or industry. *See* "Do I Need Clearance?," U.S. General Services Administration and Office of Management & Budget, *https://pra.digital.gov/do-i-need-clearance/* for additional guidance.
[191] Exec. Order No. 12898 of Feb. 11, 1994 (Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations), 59 Fed. Reg. 7629 (Feb. 16, 1994).

justice concerns.[192]

g. Environmental Health or Safety Impacts on Children

Under Executive Order 13045, “Protection of Children from Environmental Health Risks and Safety Risks,” each agency must, with respect to its rules, “to the extent permitted by law and appropriate, and consistent with the agency’s mission,” “address disproportionate risks to children that result from environmental health risks or safety risks.” For any substantive rulemaking action that “is likely to result in” a rule that may be significant under Section 3(f)(1) of Executive Order 12866 (as amended), and that may concern “an environmental health risk or safety risk that an agency has reason to believe may disproportionately affect children,” the agency must provide OIRA “an evaluation of the environmental health or safety effects of the planned regulation on children,” as well as “an explanation of why the planned regulation is preferable to other potentially and reasonably feasible alternatives considered by the agency,” unless prohibited by law.

h. Energy Impacts

Under Executive Order 13211, agencies are required to prepare and submit to OMB a Statement of Energy Effects for significant energy actions, to the extent permitted by law. This Statement is to include a detailed statement of “any adverse effects on energy supply, distribution, or use (including a shortfall in supply, price increases, and increased use of foreign supplies) should the proposal be implemented” for the action and reasonable alternatives and their effects. You need to publish the Statement or a summary in the related notice of proposed rulemaking and final rule. For further information, see OMB guidance on implementing Executive Order 13211.[193]

15. Presentation of Results and Accounting Statement

For each regulation that is significant under Section 3(f)(1) of Executive Order 12866 (as amended) an analysis should include, preferably in an executive summary or otherwise in a prominent early place, an accounting statement with tables reporting benefit and cost estimates. You should use the guidance outlined above to report these estimates. A suggested format is included at the end of this section.

a. Categories of Benefits and Costs

To the extent feasible, you should quantify all potential incremental benefits and costs. You should report benefit and cost estimates within the following three categories: monetized; quantified, but not monetized; and unquantified.

---

[192] For further information, including the definition of environmental justice, see Exec. Order No. 14096 of Apr. 21, 2023 (Revitalizing Our Nation's Commitment to Environmental Justice for All), 88 Fed. Reg. 25,251 (Apr. 26, 2023).

[193] Office of Management & Budget, *Memorandum M-01-27 (Guidance for Implementing E.O. 13211)* (July 13, 2001), *https://www.whitehouse.gov/wp-content/uploads/2017/11/2001-M-01-27-Guidance-for-Implementing-E.O.-13211.pdf*.

These categories are mutually exclusive and exhaustive. Throughout the process of listing estimates of benefits and costs, agencies should avoid double-counting. This problem may arise if more than one way exists to express the same change in social welfare.

As noted in the section "*Accounting for Benefits and Costs that Are Difficult to Quantify or Monetize*," you should consider, if feasible given the state of the evidence, categorizing or ranking non-monetized or unquantified effects in terms of their importance. You should distinguish the effects that evidence indicates are likely to be significant enough to warrant serious consideration by decision makers from those that are likely to be minor.

b. Reporting Benefits and Costs over Time

You should present undiscounted streams of benefit, cost, and net benefit estimates for each year of the analytic time horizon in a table separate from your accounting statement. Also, you should generally present annualized[194] benefits and costs in accordance with guidance provided in the section "*Discount Rates*." The streams of annualized estimates should start in the year when the regulation will begin to have effects, even if the regulation is not legally effective immediately. Report all monetized effects in constant (*e.g.*, 2022, representing the real purchasing power in that year) dollars. You should convert dollars expressed in different years' dollars using the most appropriate and reliable inflation index (*e.g.*, the Bureau of Economic Analysis's GDP price deflator or personal consumption expenditures price index) for your analysis.

c. Treatment of Risk and Uncertainty

You should provide central estimates as well as distributions about those estimates, where such information exists. When you provide only upper and lower bounds (in addition to best estimates), you should, if possible and appropriate, use the 95 and 5 percent confidence bounds. You are encouraged to develop estimates that capture the distribution of plausible outcomes.

d. Precision of Estimates

Reported estimates should reflect, to the extent feasible, the precision in the analysis. For example, an estimate of $220 million implies rounding to the nearest $10 million and thus a precision of +/-$5 million; similarly, an estimate of $222 million implies rounding to the nearest $1 million and thus, a precision of +/-$0.5 million.

[194] Computing annualized costs and benefits from present values spreads the costs and benefits equally over each period, taking account of the discount rate. The annualized value equals the present value divided by the sum of discount factors. Many spreadsheet packages, such as Excel or Sheets, include a PMT function, which calculates the annualized amount needed over a number of years to equal a given present value at a particular discount rate. If the formula returns a negative number the result should be multiplied by -1 to obtain the annualized amount.

e. Effects on State, Local, and Tribal Governments, Small Business, Wages, and Economic Growth

You may need to identify in your analysis the portions of benefits and costs received or otherwise experienced by State, local, and Tribal governments.[195] To the extent feasible, you also should identify the effects of the regulation or program on small businesses, wages, and economic growth.[196]

[195] This identification may be required by, for example, the Unfunded Mandates Reform Act of 1995, 2 U.S.C. 1532(a)(2).
[196] Regulatory Flexibility Act, 5 U.S.C. 603(c), 604.

16. Effective Date

The effective date of this Circular is March 1, 2024, for regulatory analyses received by OMB in support of proposed rules, interim final rules, and direct final rules, and January 1, 2025, for regulatory analyses received by OMB in support of other final rules. In other words, this Circular applies to the regulatory analyses for draft proposed rules that are formally submitted to OIRA after February 29, 2024, and for draft final rules that are formally submitted to OIRA after December 31, 2024. (However, if the Circular applies to the draft proposed rule, then the Circular also applies to the draft final rule, even if it is submitted prior to January 1, 2025.) To the extent feasible and appropriate, as determined in consultation with OMB, agencies should follow this Circular's guidance earlier than these effective dates. Agencies may, on a case-by-case basis, ask OMB if deviation from this Circular's guidance would be appropriate due to practical challenges related to following the guidance by these effective dates.

United States Government Accountability Office

Report to Congressional Committees

October 2023

DEFENSE INDUSTRIAL BASE

DOD Needs Better Insight into Risks from Mergers and Acquisitions

GAO-24-106129

GAO Highlights

Highlights of GAO-24-106129, a report to congressional committees

Why GAO Did This Study

DOD has reported that consolidation of its suppliers through M&A is a key risk imperiling the health and resilience of the defense industrial base. While M&A may create benefits, such as improving a supplier's financial health, they may also reduce competition and increase the risk of higher costs and reduced innovation.

To help manage these risks, DOD has established a process for assessing the potential effects of defense-related M&A. Under certain circumstances, DOD also provides input to the federal antitrust agencies, which review and, when necessary, take action to mitigate competition risks from M&A.

Congressional reports included provisions for GAO to evaluate DOD's efforts to assess the effects of M&A on the defense industrial base. This report assesses (1) the extent to which DOD has insight into defense-related M&A, and (2) the extent to which DOD monitors the effects of M&A on the defense industrial base, among other things. GAO reviewed agency policy and documentation, analyzed agency-provided and commercially available data, and interviewed agency officials.

What GAO Recommends

GAO is making four recommendations for DOD to: provide additional direction on assessing all risks and benefits identified in policy, clarify which defense suppliers' M&A need to be prioritized for assessment, assess whether Industrial Base Policy's M&A office is adequately resourced, and require monitoring of identified risks. DOD concurred with the recommendations and described its actions to address them.

View GAO-24-106129. For more information, contact W. William Russell at (202) 512-4841 or RussellW@gao.gov.

October 2023

DEFENSE INDUSTRIAL BASE

DOD Needs Better Insight into Risks from Mergers and Acquisitions

What GAO Found

The Department of Defense (DOD) has estimated that hundreds of defense companies undergo mergers and acquisitions (M&A) each year. DOD's Industrial Base Policy office and DOD stakeholders work together to conduct assessments of such M&A's risks and benefits. When M&A present risks to competition, DOD's Industrial Base Policy office also works with the antitrust agencies, which review and regulate M&A that may substantially lessen competition.

Source: Ngampol/stock.adobe.com. | GAO-24-106129

DOD's insight into defense M&A is limited. Industrial Base Policy's M&A office and DOD stakeholders assessed an average of 40 M&A per year in fiscal years 2018 through 2022, which represents a small portion of defense M&A. DOD's most recently published statistics on defense M&A, which were included in its *Fiscal Year 2017 Annual Industrial Capabilities* report, indicated that approximately 400 defense M&A occurred annually.

Most DOD assessments are initiated in response to antitrust reviews of large M&A valued over a certain dollar threshold, currently $111.4 million. Therefore, Industrial Base Policy's M&A office and DOD stakeholders focus on evaluating competition risks in their M&A assessments. While DOD policy directs Industrial Base Policy and DOD stakeholders to assess other types of risks, such as national security and innovation risks, they have not routinely done so. Moreover, DOD policy does not provide clear direction about which M&A DOD should prioritize for assessment, beyond those conducted in response to antitrust reviews. DOD officials noted that the M&A office—which is comprised of two to three staff—does not have the staff resources to initiate more assessments of smaller M&A that may also present risks. Assessing whether the M&A office has adequate resources to meet its responsibilities and clarifying which defense suppliers' M&A should be prioritized would help DOD better assess risks.

DOD generally does not monitor whether risks identified in its M&A assessments were realized. GAO found that DOD policy does not require Industrial Base Policy and DOD stakeholders to conduct monitoring. As a result, they cannot determine if risks occurred and whether further action is needed to mitigate them.

October 17, 2023

Congressional Committees

The White House and Department of Defense (DOD) have stated that a healthy and resilient defense industrial base is a critical element of U.S. power and a national priority. For decades, DOD has reported on complex challenges and risks facing the defense industrial base, including the consolidation of its supplier base through mergers and acquisitions (M&A). For example, DOD's 2022 *State of Competition within the Defense Industrial Base* reported that since the 1990s, the number of aerospace and defense prime contractors supporting DOD's weapon systems has decreased from 51 to five companies.[1] The DOD report stated that consolidation of the industrial base reduces competition for DOD contracts and leads DOD to rely on a more limited number of suppliers. This lack of competition may in turn increase the risk of supply chain gaps, price increases, reduced innovation, and other adverse effects, according to the DOD report.[2] DOD also reported that consolidation of the defense industrial base had reached historically high levels and that it needed to reevaluate its internal process for assessing M&A and continue working with the federal antitrust agencies to strengthen oversight of M&A.[3]

Members of Congress have noted similar concerns about declining competition in the defense industrial base and the potential adverse effect that industry consolidation has on weapon system programs and innovation. The Joint Explanatory Statement accompanying the National Defense Authorization Act (NDAA) for Fiscal Year 2022 and the Senate Armed Services Committee Report accompanying a bill for the James M. Inhofe NDAA for Fiscal Year 2023 included provisions for GAO to evaluate DOD's efforts to monitor and assess the effects of potential M&A

[1]Department of Defense, *State of Competition within the Defense Industrial Base* (February 2022).

[2]DOD, *State of Competition within the Defense Industrial Base*.

[3]For the purposes of this report, we refer to the Department of Justice (DOJ) and the Federal Trade Commission (FTC) as the federal antitrust agencies. The antitrust agencies enforce the antitrust laws, which prohibit business practices that unreasonably deprive consumers of the benefits of competition. Reduced competition can result in higher prices for, lower quality of, or less innovative products and services.

AR_003209

on the defense industrial base, as well as DOD's oversight processes for vetting potential M&A within the defense industrial base.[4]

This report addresses (1) the extent to which DOD has insight into defense-related M&A; (2) how DOD's role as a stakeholder to the antitrust agencies affects how it conducts M&A assessments; and (3) the extent to which DOD monitors the effects of M&A on the defense industrial base.

To address the extent to which DOD has insight into defense-related M&A, we compared DOD data on defense M&A to commercially available data to determine how many occurred, how many were assessed by DOD, and the reliability of DOD's data.[5] Our analysis covered fiscal years 2018 through 2022, the years for which DOD officials stated they had complete data on the M&A that DOD assessed. We determined these data were sufficiently reliable for the purposes of determining which M&A DOD had assessed in these years. We assessed the reliability of these data through manual data testing and interviews with DOD officials.[6] We also interviewed DOD officials to discuss their M&A policy and staff capacity, and to determine if DOD has efforts to assess the effects of industry consolidation writ large.

To further assess the extent to which DOD has insight into defense-related M&A, we analyzed agency documents to compare DOD's actual implementation of M&A assessments to the requirements established in agency policy. As part of this effort, we selected a nongeneralizable sample of nine M&A that DOD assessed in fiscal years 2018 through 2022 as illustrative examples. Our selection was generated using several criteria, including representation of a variety of outcomes (proceeded

[4]The Joint Explanatory Statement accompanying the NDAA for Fiscal Year 2022 included a provision for GAO to assess DOD's actions to monitor and assess the effects of potential mergers and acquisitions on its defense industrial base. See National Defense Authorization Act for Fiscal Year 2022: Legislative Text and Joint Explanatory Statement to Accompany S. 1605, Public Law 117-81 (Dec. 2021). The Senate Armed Services Committee report accompanying a bill for the James M. Inhofe NDAA for Fiscal Year 2023 included a provision for GAO to evaluate DOD's oversight processes for vetting proposed mergers and acquisitions within the defense industrial base. See S. Rep. No. 117-130, at 204 (2022).

[5]For the purposes of this report, defense-related M&A indicates that one or more companies involved in a merger or acquisition supplies the defense industry.

[6]DOD officials told us that data from fiscal years before 2018 may be incomplete in part due to problems arising from a server migration and changes in data collection practices.

AR_003210

without further review, remedied, or blocked), merger values, and fiscal year of assessment.

To address how DOD's role as a stakeholder to the antitrust agencies affects how it conducts M&A assessments, we reviewed DOD and antirust agency policy and guidance to determine how DOD is expected to support antitrust reviews led by the Department of Justice (DOJ) and the Federal Trade Commission (FTC). In doing so, we determined what information DOD has access to when it conducts M&A assessments and the nature and extent of its role in determining the outcome of antitrust reviews. We also interviewed DOD and antitrust agency officials and analyzed information from our nine illustrative examples to understand how DOD and the antitrust agencies interacted and shared information during those assessments.

To address the extent to which DOD monitors the effects of M&A on the defense industrial base, we reviewed agency policy to determine DOD's requirements for monitoring the effects of completed M&A. We also interviewed DOD officials and reviewed agency documentation to determine if DOD has efforts underway to assess the effects of specific M&A. A more detailed description of our scope and methodology is included in appendix I.

We conducted this performance audit from June 2022 to October 2023 in accordance with generally accepted government auditing standards. Those standards require that we plan and perform the audit to obtain sufficient, appropriate evidence to provide a reasonable basis for our findings and conclusions based on our audit objectives. We believe that the evidence obtained provides a reasonable basis for our findings and conclusions based on our audit objectives.

Background

The U.S. defense industrial base includes the people, technology, institutions, technological know-how, and facilities used to design, develop, manufacture, and maintain the weapons and other goods and services needed to meet U.S. national security objectives. The defense industrial base is composed of several tiers: top tiers that include prime contractors and major subcontractors, and lower tiers that include suppliers of parts, electronic components, and raw materials.

DOD stated in its 2022 *State of Competition within the Defense Industrial Base* report that a robust defense industrial base is essential to meeting

U.S. national security objectives.[7] Accordingly, DOD views any risk to the industrial base—any event or condition that can disrupt or degrade DOD supplier capabilities or capacity needed to equip or sustain military forces now and in the future—as a threat to U.S. national security. Industry consolidation caused by M&A between defense contractors and suppliers is one type of risk affecting the defense industrial base.[8]

Federal Antitrust Reviews of Mergers and Acquisitions

The antitrust agencies are responsible for the enforcement of the antitrust statutes: the Sherman Act, the Clayton Act, and the FTC Act.

- The Sherman Act is the oldest law governing antitrust, and outlaws all contracts, combinations (such as trusts), and conspiracies that restrain interstate and foreign trade and commerce. The Sherman Act also prohibits the monopolization or attempts to monopolize any part of interstate and foreign trade.[9]
- The Clayton Act provided more detail on certain practices not included under the Sherman Act. The current version of the statute generally prohibits mergers or acquisitions that may substantially lessen competition or tend to create a monopoly, among other things.[10]
- The FTC Act created FTC and bans unfair methods of competition.[11]

To enforce the antitrust laws, the antitrust agencies review M&A and evaluate whether they may substantially lessen competition or may tend to create a monopoly. These reviews can occur in any sector of the economy and, regardless of the specific companies or markets involved, the antitrust agencies' focus is primarily on the potential risks to competition. For example, during antitrust reviews of defense-related

[7]DOD, *State of Competition within the Defense Industrial Base.*

[8]Industry consolidation is one risk among many affecting the defense industrial base. Other types of industrial base risks include, but are not limited to, workforce shortfalls, foreign dependency, cybersecurity, obsolescence, and erosion of U.S.-based infrastructure.

[9]Ch. 647, 26 Stat. 209, § 1-2 (1890) (codified as amended at 15 U.S.C. § 1-2).

[10]Ch. 323, 38 Stat. 730 (1914) (codified as amended at 15 U.S.C. § 12-27; 29 U.S.C. § 52-53). The current version of the Clayton Act prohibits individuals subject to FTC's jurisdiction from acquiring the whole or any part of the assets of another person engaged in commerce or in an activity affecting commerce, where in any line of commerce or in any activity affecting commerce in any section of the United States, the effect of such acquisition may be substantially to lessen competition, or to tend to create a monopoly. See 15 U.S.C. § 18.

[11]Ch. 311, 38 Stat. 717, § 1, 5 (1914) (codified as amended at 15 U.S.C. § 41, 45(a)).

AR_003212

M&A, the antitrust agencies evaluate how a merger or acquisition would affect competition in the defense industrial base. Antitrust agency officials told us that they will consider other types of risks, such as risks to national security and innovation, only if they can link those risks to a potential lessening of competition.

The antitrust agencies can review any M&A, but receive notice from the merging parties only if the merger or acquisition is valued over certain dollar thresholds and meets other requirements. The Hart-Scott-Rodino Antitrust Improvements (HSR) Act of 1976 amended the Clayton Act and established the Premerger Notification Program.[12] The HSR Act requires companies to notify the antitrust agencies when initiating and prior to completing certain M&A over certain dollar thresholds and to wait for a period—generally 30 days—before conducting the merger or acquisition.[13] This provides DOJ and FTC an opportunity to evaluate the potential competitive effects of the merger or acquisition. As of February

[12]See Pub. L. No. 94-435, § 201 (1976) (codified as amended at 15 U.S.C. § 18a). For the HSR Act to apply to a particular transaction, it must generally satisfy three tests: the commerce test, the size of transaction test, and the size of person test. An acquisition will satisfy the commerce test if either of the parties to a transaction is engaged in commerce or in any activity affecting commerce. See 15 U.S.C. § 18a(a)(1). The size of transaction test is met if, as a result of the acquisition, the acquiring person will hold an aggregate amount of voting securities, and assets of the acquired person valued at more than $50 million, as adjusted (currently $111.4 million). For M&A exceeding $50 million, as adjusted (currently $111.4 million), but less than $200 million, as adjusted (currently $445.5 million), the size of person test is met if a person who has total assets or annual net sales of at least $100 million, as adjusted (currently $222.7 million) acquires (1) any voting securities or assets of a person engaged in manufacturing which has annual net sales or total assets of at least $10 million, as adjusted (currently $22.3 million); (2) any voting securities or assets of a person not engaged in manufacturing which has total assets of $10 million, as adjusted (currently $22.3 million); or (3) any voting securities or assets of a person with annual net sales or total assets of $10 million, as adjusted (currently $22.3 million). See 15 U.S.C. § 18a(a)(2)(B). Transactions in excess of $200 million, as adjusted (currently $445.5 million), do not need to meet the size of the person test to qualify. See 15 U.S.C. § 18a(a)(2)(A). Certain transactions that meet these tests may be exempt from premerger notification rules and the waiting period. See 15 U.S.C. § 18a(c). For the current thresholds, see Federal Trade Commission: Revised Jurisdictional Thresholds, 88 Fed. Reg. 5004 (Jan. 26, 2023).

[13]The initial waiting period under the HSR Act is generally 30 days, except for cash tender offers where it is reduced to 15 days. See 15 U.S.C. § 18a(b)(1). The waiting period starts on the date that FTC and the Assistant Attorney General of DOJ's Antitrust Division receive completed notification of the merger as required by law, or if notification is not completed, notification to the extent completed and a statement of reasons for noncompliance. See 15 U.S.C. § 18a(b)(1)(A). FTC and the Assistant Attorney General may terminate the waiting period in individual cases and allow a person to proceed with the acquisition. 15 U.S.C. §18a(b)(2). FTC or the Assistant Attorney General may also extend the waiting period under certain circumstances.

2023, the adjusted HSR premerger notification transaction threshold for a merger or acquisition is $111.4 million.[14] DOJ and FTC may also review smaller M&A that may substantially lessen competition or tend to create a monopoly. However, for these smaller M&A, the HSR Act does not require companies to report the M&A to the antitrust agencies and they do not have to wait until the end of a 30-day waiting period to carry out their merger or acquisition.

Federal antitrust reviews have different stages, depending on whether the antitrust agencies initially determine that competition risks are present.

- The **initial review** stage usually takes place during the 30-day waiting period, during which time the antitrust agencies review the M&A to determine any potential antitrust concerns that warrant additional scrutiny. Officials from DOD's Office of Industrial Base Policy (IBP) told us that during this initial review, the antitrust agencies solicit input on potential competition risks from affected customers and interested parties, such as federal agencies that may contract with the merging companies. For example, IBP officials told us that if the antitrust agencies determine that a merger or acquisition involves a company with a defense equity, they may request DOD's input on how the M&A could affect DOD programs.[15] After collecting information from these affected parties and conducting their own analysis, the antitrust agencies determine whether there is evidence that the potential M&A would substantially lessen competition or tend to create a monopoly. The Hart-Scott-Rodino Annual Report for Fiscal Year 2021 showed that about 98 percent of M&A proceeded after this initial review.
- The antitrust agencies can initiate a **second request** to request additional information on how the M&A will affect competition. The second request can extend the waiting period, during which the merging parties cannot complete their M&A until they have substantially complied with the second request. Second requests are infrequent and about 2 percent of reviews carried out in response to HSR filings proceeded to that stage, according to Hart-Scott-Rodino Annual Report for Fiscal Year 2021.

M&A subject to federal antitrust reviews can have multiple potential outcomes. The antitrust agencies allow nearly all M&A to proceed without

[14]See Federal Trade Commission: Revised Jurisdictional Thresholds, 88 Fed. Reg. 5004 (Jan. 26, 2023).

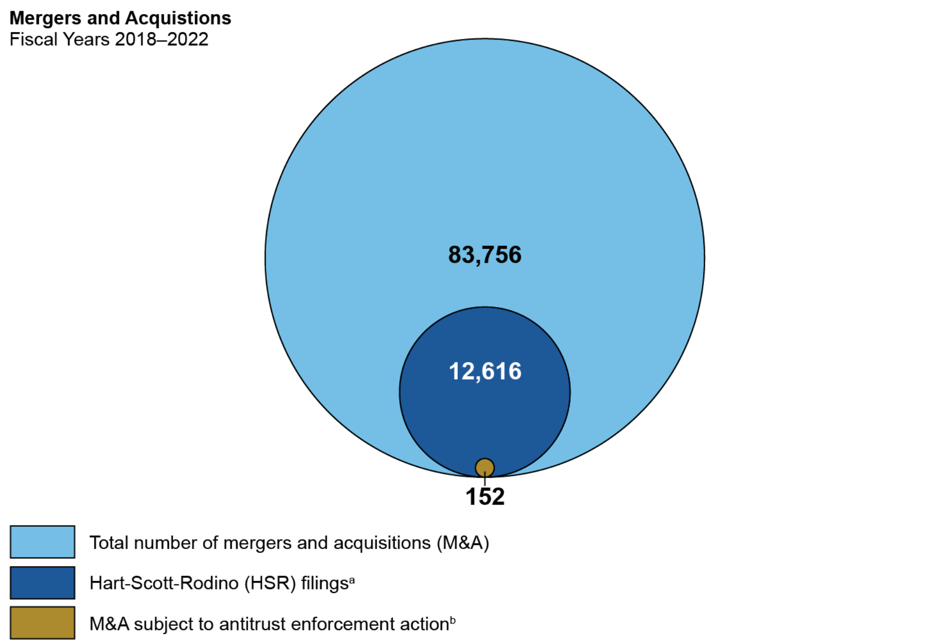
[15]For the purposes of this report, a merger or acquisition with a defense equity indicates that one or more companies involved supplies the defense industry.

challenge after an initial review under the HSR process. If the antitrust agencies have reason to believe a merger or acquisition could result in potential violations of certain antitrust statutes, they can take enforcement action to remedy the risks. For example, the antitrust agencies may negotiate an agreement with the parties to remedy the competition concerns. The agreement could result in a structural remedy (e.g., the divestiture of a line of business) or a behavioral remedy (e.g., creating firewalls between certain lines of business). If the antitrust agencies and the merging parties cannot negotiate an agreement or the antitrust agencies believe that the risks are too challenging to mitigate, either of the antitrust agencies may request a preliminary injunction in federal district court to block the M&A from proceeding.[16] Between fiscal years 2018 and 2022, there were at least 83,756 M&A in the U.S. economy, according to commercially available data. The antitrust agencies received 12,616 filings under the HSR Act during the same period, which resulted in approximately 152 enforcement actions, as shown in figure 1 below.[17] On average, around 1 percent of HSR filings result in an enforcement action.

[16]See 15 U.S.C. § 18a(f).

[17]Data on fiscal year 2022 enforcement actions were not available at the time of our report, so the statistic on enforcement actions includes fiscal years 2018-2021.

Figure 1: Mergers and Acquisitions Subject to Antitrust Enforcement Action



Source: GAO analysis of Hart-Scott-Rodino Annual Reports and publicly available antitrust agency data. | GAO-24-106129

[a]The HSR Act requires companies to notify the antitrust agencies when initiating and prior to completing certain M&A over certain dollar thresholds and to wait for a period of 30 days before conducting the merger or acquisition. During this 30-day period, the antitrust agencies and interested parties, such as the Department of Defense, review whether the M&A may substantially reduce competition or tend to create a monopoly.

[b]Data on fiscal year 2022 enforcement actions were not available at the time of GAO's report, so this total includes enforcement actions in fiscal years 2018-2021.

DOD Process for Assessing Risks and Benefits Posed by Defense M&A

To identify and better understand the effects of consolidation on the defense industrial base, DOD can conduct assessments of defense M&A. DOD's M&A policy, DOD Directive 5000.62, outlines a department-wide policy for assessing M&A in the defense industrial base.[18] DOD's M&A policy stipulates that through these assessments, DOD will consider the effect of M&A on competition for DOD contracts and subcontracts, innovation of defense technologies, DOD costs, and national security, among other things. For example, DOD may assess if the M&A will reduce competition when contracting for a particular product or service purchased by defense programs. DOD officials stated that they may also

[18]Department of Defense, *Review of Mergers, Acquisitions, Joint Ventures, Investments, and Strategic Alliances of Major Defense Suppliers on National Security and Public Interest*, DOD Directive 5000.62 (Feb. 27, 2017).

AR_003216

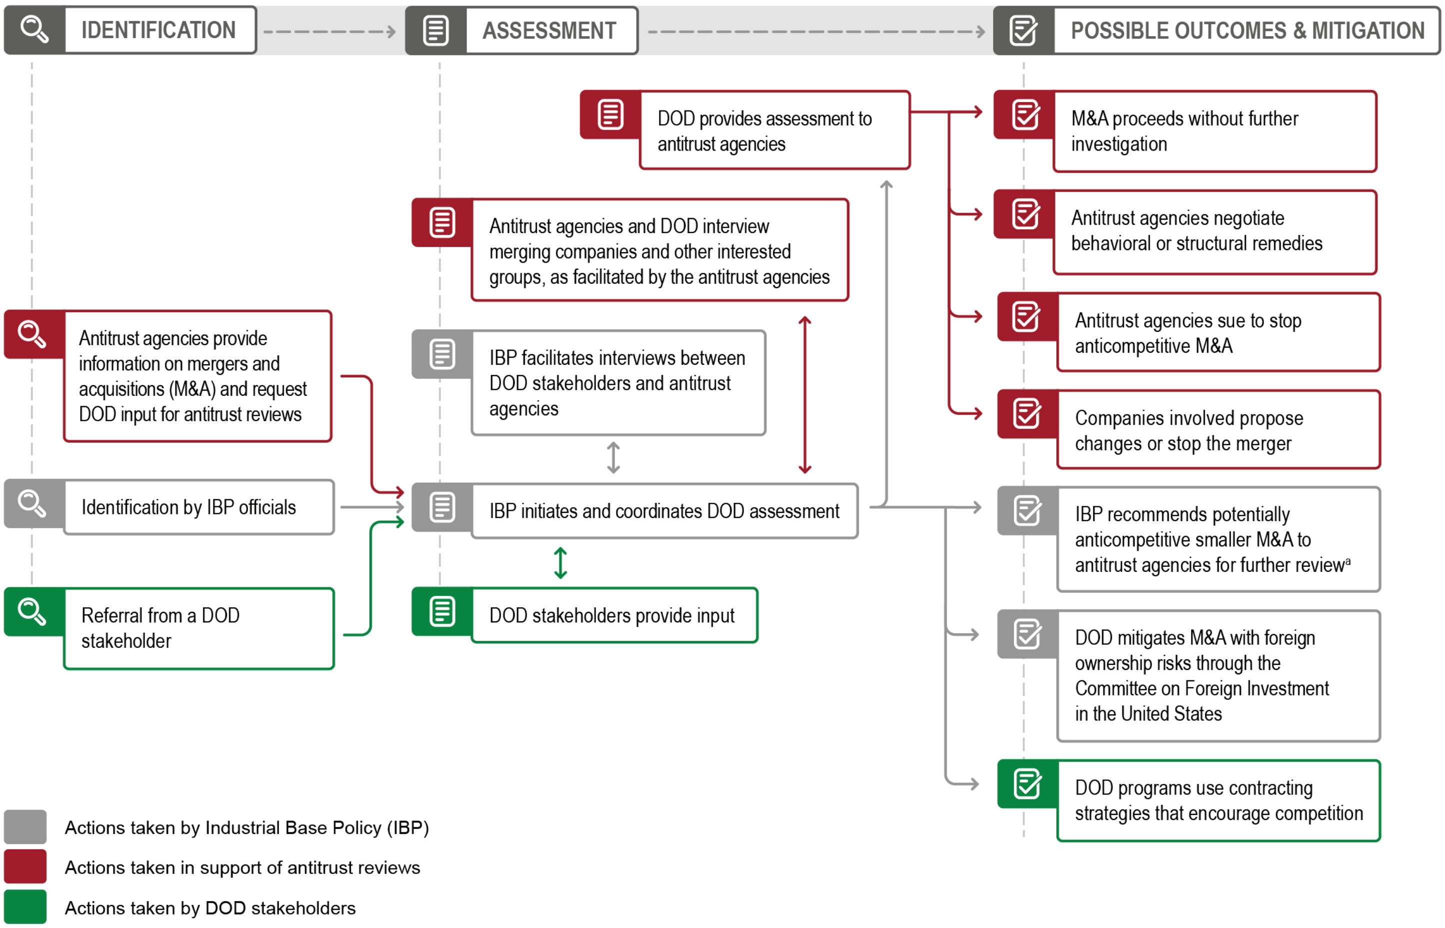
assess if the M&A would result in a foreign company or a commercial company owning a critical defense supplier, which could pose a national security risk. DOD officials told us that under certain circumstances, DOD will share information requested by the antitrust agencies and coordinate its M&A assessments with the antitrust agencies, which, as noted above, have the authority to challenge certain M&A that that violate certain antitrust statutes.

According to DOD's M&A policy, DOD's M&A assessments are a department-wide effort supported by multiple organizations across DOD. Under the authority, direction, and control of the Under Secretary of Defense for Acquisition and Sustainment, IBP determines the need to assess certain M&A involving major defense suppliers, develops DOD's recommended position on reviewed M&A, and seeks input from program offices and certain DOD stakeholders, among other duties.[19] IBP's M&A office, comprised of two to three full-time equivalent employees, initiates and coordinates the DOD-wide assessment. A department-wide network of DOD stakeholders supports the M&A office by providing input on the assessments. IBP officials told us that 33 stakeholder organizations across DOD help IBP identify relevant M&A and provide input on the potential risks and benefits of M&A based on the nature and scope of their interactions with the merging companies. According to IBP officials, these stakeholders generally work in acquisitions for their respective military departments, field activities, or defense agencies (such as the Defense Logistics Agency or the Missile Defense Agency). Figure 2 depicts DOD's notional M&A assessment process and the key organizations involved.

[19]DOD Directive 5000.62 provides that the Deputy Assistant Secretary of Defense for Manufacturing and Industrial Base Policy undertake certain responsibilities related to industrial base assessments under the authority, direction, and control of the Under Secretary of Defense for Acquisition, Technology, and Logistics. The National Defense Authorization Act for Fiscal Year 2017 reorganized the Office of the Secretary of Defense by dissolving the Under Secretary of Defense for Acquisition, Technology, and Logistics and establishing the Under Secretary of Defense for Acquisition and Sustainment and the Under Secretary of Defense for Research and Engineering. See Pub. L. No. 114-328, § 901(a)-(b) (2016) (codified as amended at 10 U.S.C. § 133a-133b). IBP officials told us that the office of the Deputy Assistant Secretary of Defense for Manufacturing and Industrial Base Policy was reorganized, and IBP now assumes the directive's roles and responsibilities for Manufacturing and Industrial Base Policy, and they operate under the authority, direction, and control of the Under Secretary of Defense for Acquisition and Sustainment.

AR_003217

Figure 2: Notional Department of Defense (DOD) Process for Merger and Acquisition Assessments



Source: GAO analysis of DOD and antitrust agency information. | GAO-24-106129

[a]The antitrust agencies can review any M&A, but receive notice from the merging parties only if the merger or acquisition is valued over certain dollar thresholds and meets other requirements, as established in the Hart-Scott–Rodino Antitrust Improvements (HSR) Act of 1976. As of February 2023, the adjusted HSR premerger notification threshold for a merger or acquisition was $111.4 million. The Department of Justice and the Federal Trade Commission may also review smaller M&A, but the HSR Act does not require companies to report these M&A to the antitrust agencies. Instead, antitrust officials said they learn about these M&A from news reporting or affected market participants, such as DOD.

Identifying M&A. IBP initiates a DOD M&A assessment after learning about a defense merger or acquisition through one of three ways:

- Requests for input from one of the antitrust agencies: During an antitrust review, the antitrust agencies may solicit DOD input if they determine that the merger or acquisition has defense equities and DOD is an affected customer. DOD provides input on how the proposed M&A may affect competition in the defense industrial base.

- IBP's own research: IBP identifies proposed M&A on its own through several means, including news reporting and public data sources. For example, IBP officials told us that, in some cases, they identify announced M&A involving DOD suppliers through their subscriptions to market intelligence services and determine whether the proposed M&A warrants further DOD assessment and potential elevation to the antitrust agencies for review. According to DOD's M&A policy, IBP should consider risks related to national security, the industrial and technological base, competition, innovation, or other issues, including those related to the public interest, when deciding if a DOD assessment is needed.
- Referral from a DOD stakeholder: Stakeholders across DOD notify IBP if they become aware of M&A that could affect their programs. Stakeholders told us that they become aware of such M&A through a variety of ways, including public news reporting and acquisition program officials' day-to-day interactions with contractors.

Assessing M&A. When IBP officials begin an M&A assessment, they conduct initial research about the companies involved and reach out to DOD stakeholders to solicit their input on how the M&A could affect their acquisition programs. According to IBP officials, the M&A office generally sends out a wide call for stakeholder input, but also tries to identify the particular offices likely to be most affected by the proposed M&A to make sure their views are incorporated. These stakeholders have subject matter experts who are able to conduct deep-dive analyses on how a proposed M&A could affect particular acquisition programs. IBP collects responses from stakeholders and develops a consolidated DOD position on the likely risks and benefits of the proposed M&A.

Mitigating M&A risks. When IBP and DOD stakeholders identify potential risks to the defense industrial base through their M&A assessments, there are several ways they can mitigate these risks. According to IBP officials, the most effective way to mitigate identified competition risks is to provide this information to the antitrust agencies, which are statutorily empowered to take enforcement action, as appropriate, to preserve competition.

There are also mitigation measures that DOD can implement on its own to address any of the risks it identifies. For example, IBP officials said that DOD programs are able to increase opportunities for competition by

AR_003219

breaking up a large contract or requirement into several smaller contracts or including competition effects in the source selection criteria for contract awards. Additionally, if the M&A involves a foreign company, the Committee on Foreign Investment in the United States, which is an interagency group that addresses national security risks that result from foreign investment in U.S. companies, may examine the transaction.[20] Furthermore, DOD manages funding designated to support the defense industrial base, which can also help mitigate M&A risks. DOD's Industrial Base Analysis and Sustainment program, for instance, supports initiatives to increase industrial manufacturing capabilities and supply chain resiliency. DOD can also use funding under Defense Production Act authorities to establish, expand, maintain, or restore domestic production capacity for critical components and technologies.[21]

Prior GAO Work on DOD Industrial Base Efforts

GAO has issued several reports on DOD's efforts to manage risks affecting the defense industrial base, such as risks related to M&A. We have found that DOD's management of the defense industrial base poses a risk to its acquisition of weapons systems, and this management challenge is included in our *High-Risk Series* report as an area of significant concern.[22] In our prior reports, we found the following:

- In June 2018, we recommended that DOD make better use of existing supplier data to identify risks to the industrial base, as well as identify the appropriate workforce mix of government personnel and contractor support staff needed to work with business-sensitive data.[23] DOD partially concurred with these recommendations and has since taken action to implement both of them. To implement our

[20]The Committee on Foreign Investment in the United States is responsible for assessing, reviewing, and investigating covered transactions—which include, for example, mergers, acquisitions, or takeovers carried out by a joint venture that could result in control of a U.S. business by a foreign government or an entity controlled by or acting on behalf of a foreign government. In examining covered transactions, committee members seek to identify and address, as appropriate, any national security concerns that arise as a result of the transaction.

[21]See Defense Production Act of 1950, Pub. L. No. 81-774 (1950) (codified as amended at 50 U.S.C. §§ 4501 et seq.).

[22]GAO, *High-Risk Series: Efforts Made to Achieve Progress Need to Be Maintained and Expanded to Fully Address All Areas,* GAO-23-106203 (Washington, D.C.: Apr. 20, 2023).

[23]IBP relied extensively on contractor support staff in its workforce but could not provide contractors with access to business-sensitive proprietary data due to its interpretation of the Trade Secrets Act. GAO, *Defense Industrial Base: Integrating Existing Supplier Data and Addressing Workforce Challenges Could Improve Risk Analysis*, GAO-18-435 (Washington, D.C.: June 13, 2018).

supplier data recommendation, IBP worked with the military departments and other DOD organizations to compile data on the prime contractors and first and second tier suppliers supporting certain weapon systems. These data will be integrated into a DOD-wide data system and used to assess industrial base risks. DOD implemented our workforce recommendation by conducting a staffing assessment and, as a result, requesting 14 additional staff members for its industrial base analytics office.

- In June 2022, we recommended that DOD update its industrial base assessment instruction to ensure that DOD has greater insight into industrial base risks across the department.[24] DOD concurred with this recommendation and plans to update the instruction by September 2025.
- In July 2022, we reported that DOD had yet to develop a congressionally mandated analytical framework for mitigating industrial base risks across the acquisition process.[25] We additionally found that DOD did not have a consolidated and comprehensive strategy to mitigate risks in the defense industrial base and was not collecting the information that such a strategy would require to track the status of those risks. As a result, we recommended that DOD develop a consolidated and comprehensive industrial base strategy. DOD partially concurred with this recommendation, noting that it agrees with the importance of a comprehensive strategy. According to DOD officials, IBP is in the process of developing an overarching DOD industrial base strategy and expects to release it by May 2024.

A list of our prior work on DOD's industrial base efforts is provided at the end of this report.

DOD Has Limited Insight into the Potential Risks of Most Defense M&A

DOD has limited insight into most defense-related M&A, as it focuses its resources on assessing high-dollar-value M&A for competition risks in support of antitrust reviews. While DOD's most recent estimates found there were approximately 400 M&A occurring each year in the defense industrial base, IBP and DOD stakeholders assessed an average of 40 M&A per year between fiscal years 2018 and 2022. DOD policy states that IBP is responsible for determining the need to assess any M&A involving a major defense supplier, but the office's efforts have largely focused on assessing high-dollar-value M&A so DOD could provide input

[24]GAO, *Weapon Systems Annual Assessment: Challenges to Fielding Capabilities Faster Persist*, GAO-22-105230 (Washington, D.C: June 8, 2022).

[25]GAO, *Defense Industrial Base: DOD Should Take Actions to Strengthen Its Risk Mitigation Approach*, GAO-22-104154 (Washington, D.C.: July 7, 2022).

to antitrust reviews.[26] For the M&A that IBP and DOD stakeholders did assess, they primarily focused on evaluating competition risks to provide information needed for antitrust reviews. Their assessments placed less emphasis on potential benefits, such as strengthening the financial position of a supplier, or other types of risks identified in DOD policy, such as national security or innovation risks.

DOD Assessments Are Generally Limited to High-Dollar-Value Defense M&A

DOD assessed an average of 40 M&A each year in fiscal years 2018 through 2022, out of hundreds of M&A estimated to occur in the defense industrial base each year. DOD's most recently published statistics on defense M&A—which were included in its *Fiscal Year 2017 Annual Industrial Capabilities* report—indicated that approximately 400 defense-related M&A were occurring annually in the aerospace and defense sector.[27] IBP officials could not say with certainty how many defense-related M&A now occur annually because they no longer track or maintain data on all M&A in the defense industrial base. IBP officials said they stopped collecting and reporting these data because they faced challenges in identifying the universe of defense-related M&A due to the complex structure of the defense industrial base. IBP officials told us that the defense industrial base is comprised not only of companies in the aerospace and defense sector, but also of companies in other sectors of the economy that support both defense and commercial customers, such as shipbuilders or semiconductor companies. IBP officials noted that collecting data on M&A across multiple sectors of the economy makes it challenging and time-consuming for DOD to estimate the total number of defense-related M&A.[28]

[26]DOD's M&A policy defines a "major defense supplier" as any prime contractor or subcontractor that IBP or certain other officials designate as a main source of supply, including any company that "supplies or could supply goods or services directly or indirectly to DOD or any company with technology potentially significant to defense capabilities." The policy also specifies that the following are considered a major defense supplier even if they have not been designated as one: (1) any prime contractor of a major system, as defined by provisions currently codified at 10 U.S.C. § 3041(a)-(b), and (2) any prime contractor of a contract awarded pursuant to provisions currently codified at 10 U.S.C. § 3204(a)(3) for reasons outlined in clause (A) of that subsection.

[27]DOD, *Fiscal Year 2017 Annual Industrial Capabilities* (Washington, D.C.: Apr. 12, 2018).

[28]In attempting to validate how many defense-related M&A occur annually, we analyzed commercially available M&A data and encountered data limitations similar to those experienced by DOD officials. Appendix I includes more information about our analysis of defense-related M&A using commercially available data.

AR_003222

DOD’s M&A assessments between fiscal years 2018 and 2022 largely concentrated on high-dollar-value M&A that were subject to antitrust reviews, as shown in table 1 below.

Table 1: DOD-Assessed Mergers and Acquisitions (M&A) Compared to HSR Thresholds, Fiscal Years 2018-2022

	2018	2019	2020	2021	2022
Total number of assessed M&A	17	65	36	48	32[a]
Number of M&A assessed by DOD that were above applicable HSR thresholds for antitrust review[b]	17	22	27	48	26
Number of M&A assessed by DOD that were below applicable HSR thresholds for antitrust review	0	43[c]	9	0	5

Source: GAO analysis of Department of Defense (DOD) data, based on the Hart-Scott-Rodino (HSR) transaction threshold at the time of the merger or acquisition. | GAO-24-106129

[a]In fiscal year 2022, there was one case for which DOD could not provide information on whether the M&A exceeded the HSR threshold.

[b]From fiscal years 2018 through 2022, the HSR transaction threshold ranged from $80.8 million to $101 million.

[c]Industrial Base Policy officials attributed the 1-year spike in below-threshold M&A assessments in fiscal year 2019 to an M&A office initiative to identify whether smaller-dollar-value M&A posed risks to the defense industrial base.

In 4 of the 5 years from fiscal years 2018 through 2022, nearly all of IBP’s assessments focused on M&A that surpassed the applicable HSR transaction threshold, according to IBP’s data. Fiscal year 2019 was the only exception to this trend, during which year IBP assessed 43 M&A that its data indicated were below the HSR transaction threshold. IBP officials attributed this to an M&A office initiative in fiscal year 2019 to identify whether smaller-dollar-value M&A posed risks to the defense industrial base by scanning for such transactions and initiating internal assessments. IBP officials stated that they did not identify major concerns from such M&A at the time and, as a result, stopped scanning for such M&A.

We found that IBP infrequently identifies M&A that may present a risk to DOD through methods outside of antitrust agencies’ requests for input, such as through stakeholder referrals or IBP-led trend analyses. DOD’s M&A policy allows DOD stakeholders to submit referrals for potential assessments, but IBP officials and stakeholders stated that stakeholders infrequently submit such referrals. Additionally, IBP officials said their M&A office is not collecting robust data or conducting recurring trend analyses that could help them identify M&A in risky areas of consolidation among defense suppliers. For example, DOD's annual reports on the industrial base describe specific above-threshold M&A that DOD assessed in a given fiscal year in support of antitrust reviews, but no longer describe all M&A involving major defense suppliers or consolidation trends. IBP also conducted new sector-specific M&A trend analyses in support of the February 2022 *State of Competition within the Defense Industrial Base* report, which found that there was significant consolidation among contractors for major weapon systems. IBP officials told us that these were onetime efforts and they have not kept these trend analyses up to date.

Unclear Policy and Limited Resourcing Hinder IBP's Ability to Assess Defense M&A

Although most of DOD's focus is on assessing high-dollar-value M&A, its M&A policy states that IBP is responsible for determining the need to initiate DOD assessments for a broad range of defense-related M&A. According to DOD's M&A policy, IBP can initiate an assessment of an actual or proposed merger or acquisition involving any major defense supplier. IBP officials told us this broad authority is useful because it allows DOD to assess a wide range of companies they or DOD stakeholders deem critical to DOD programs.

We found that IBP focuses on assessing high-dollar-value M&A instead of a broader range of defense M&A, in part, because of unclear policy on which major defense suppliers to prioritize for assessment and limited staff resources within IBP. These factors hinder IBP's ability to identify and assess additional M&A that may present risks to the defense industrial base. GAO's *Standards for Internal Control in the Federal Government* state that agency management should define objectives clearly to enable the identification of risks and establish the organizational structure necessary to achieve its objectives.[29] Doing so helps agencies ensure that they identify relevant risks and have the appropriate amount of staff resources to mitigate those risks.

Unclear direction in DOD's M&A policy and no additional guidance. DOD's M&A policy states that IBP is responsible for determining the need to assess any merger or acquisition involving a major defense supplier, but the policy does not provide clear direction on which major defense suppliers IBP and DOD stakeholders should prioritize for the purposes of conducting M&A assessments. According to IBP officials, DOD also does not currently have additional guidance to supplement its M&A policy and

[29]GAO, *Standards for Internal Control in the Federal Government*, GAO-14-704G (Sept. 10, 2014).

provide implementation instructions. As a result, IBP officials said they do not have any documented DOD-specific criteria in the M&A policy or additional guidance to help prioritize their efforts to assess defense-related M&A that pose risks. In the absence of clear direction in the DOD policy or additional guidance, IBP officials told us that they prioritize the high-value M&A the antitrust agencies notify them about as a proxy for identifying which M&A present the highest risk. IBP officials said this approach helps them ensure DOD is being responsive to antitrust agency requests for input and assessing M&A the antitrust agencies have determined may present risks to competition. IBP and stakeholder officials said, however, that this focus on high-value M&A has resulted in DOD not comprehensively assessing the M&A of smaller suppliers, including those that supply critical products to DOD.

The DOD M&A policy generally defines a major defense supplier as any prime contractor or subcontractor that certain DOD officials, including those within IBP, designate as a main source of supply, as well as prime contractors that meet certain criteria.[30] Companies qualifying for designation as major defense suppliers include any firm that supplies or could supply goods or services, directly, or indirectly, to DOD or any company with technology potentially significant to defense capabilities. In addition, all prime contractors supporting major systems are automatically considered major defense suppliers.[31] DOD officials estimate that the defense industrial base is comprised of approximately 200,000 contractors. Under DOD's M&A policy, a potentially large number of these contractors could be considered or could qualify for designation as a major defense supplier. As a result, IBP officials and DOD stakeholders

[30]DOD's M&A policy specifies that the following are considered a major defense supplier even if they have not been designated as one: (1) any prime contractor of a major system, as defined by provisions currently codified at 10 U.S.C. § 3041(a)-(b), and (2) any prime contractor of a contract awarded pursuant to provisions currently codified at 10 U.S.C. § 3204(a)(3) for reasons outlined in clause (A) of that subsection.

[31]Major systems generally refer to a combination of elements that will function together to produce the capabilities required to fulfill a mission need, including hardware, equipment, software, or any combination thereof, but excluding construction or other improvements to real property. A DOD system is considered a major system if (1) the milestone decision authority designates it as a major system; or (2) it is estimated to require an eventual total expenditure for research, development, test, and evaluation of more than $200 million in fiscal year 2020 constant dollars, or for procurement of more than $920 million in fiscal year 2020 constant dollars. See 10 U.S.C. § 3041(a)-(c); DOD Instruction 5000.85, *Major Capability Acquisition* (Aug. 6, 2020) (incorporating change 1, Nov. 4, 2021) (reflecting statutory major system cost thresholds in fiscal year 2020 constant dollars).

told us that they have to focus their efforts for identifying relevant M&A due to the number of potential M&A to assess.

DOD’s M&A policy, however, does not provide clear direction on how IBP and DOD stakeholders should determine which of these defense companies present the most risk to prioritize their efforts. We discussed with IBP potential mechanisms officials could use to help prioritize M&A for assessment, but officials stated that they had not used them. For example, IBP officials we met with stated that there is not a comprehensive list of suppliers that DOD considers to be major defense suppliers for the purposes of conducting M&A assessments. Additionally, the M&A policy does not specifically direct IBP to use existing DOD determinations of high-priority supply chains or industrial base risks to prioritize M&A assessments. For example, DOD’s most recent annual Industrial Capabilities Report identifies its five highest priority supply chains and four industrial base strategic risk areas. IBP officials said that focusing on M&A related to these high-priority supply chains and strategic industrial base risks is one way they could prioritize their efforts, but they have not used these existing determinations to guide which defense suppliers to prioritize for M&A assessments.

IBP officials also said that DOD’s understanding of which companies comprise the defense industrial base has evolved over time, expanding from just prime contractors in the aerospace and defense sector to also include sub-tier aerospace and defense suppliers and contractors in other sectors. For example, IBP officials told us that since 2018, IBP has expanded its understanding of the defense industrial base to include sectors that support defense programs outside of the traditional aerospace and defense sector, such as pharmaceuticals, information technology, and semiconductors. DOD’s broadened understanding of the defense industrial base underscores how the absence of more clear direction on how to prioritize among major defense suppliers hinders IBP’s ability to ensure it identifies and assesses M&A that present risks to DOD.

Furthermore, we found two of the military department stakeholders we spoke with were using proxy criteria to identify and prioritize defense-related M&A, in the absence of clear direction in the DOD policy. For example, one stakeholder told us that they consider whether the M&A would affect a critical DOD program, if it involves a contractor that produces a unique military item, and if one or more of the companies involved is a sole source vendor (i.e., the vendor is the only source capable of providing the item). Another stakeholder told us that due to the

AR_003226

high volume of M&A identified through their publicly available data source, they filter what they refer to IBP for further assessment based on those companies with which it has contracts.

IBP resource constraints. IBP has a small M&A office, so there are limits on the amount of work it can conduct to identify and assess defense-related M&A. According to IBP officials, DOD established IBP's M&A office in 2017 with one full-time equivalent staff member and expanded it to two to three full-time equivalents in fiscal year 2021. IBP officials told us that if DOD is providing input for many antitrust reviews or if there is a large or complex M&A assessment, those assessment activities can consume the majority of the M&A office's staff resources. IBP officials said that, to the best of their knowledge, IBP has not studied how many additional staff it would need to conduct additional assessments. They also noted that the DOD stakeholders that support IBP during M&A assessments similarly face resource constraints.

IBP officials identified multiple activities that they cannot conduct due to limited staff resources.

- IBP officials said they have limited capacity to scan for M&A above the HSR transaction threshold that do not have an obvious defense equity. IBP officials told us that if a merger undergoing an antitrust review primarily affects commercial customers, it may not be immediately clear to the antitrust agencies that there is a defense equity. IBP, DOJ, and FTC officials told us that IBP can proactively reach out and ask to provide input on M&A with a defense equity even if DOD is not contacted by the antitrust agencies—but that is contingent upon DOD being aware that the defense merger or acquisition is occurring.
- IBP officials said they are limited in their ability to scan for defense-related M&A under the HSR transaction threshold. IBP officials told us that their efforts to scan for smaller M&A (for which merging parties do not have to notify the antitrust agencies) is secondary to their efforts to respond to existing antitrust reviews and they often do not have the capacity to conduct this additional research.
- IBP officials told us that their office does not have the capacity to conduct any recurring macro-level trend analyses or a complete analysis of markets following mergers to assess defense industrial base consolidation. If they become aware of a particular company conducting several M&A, they will review whether the company has

acquired concentrated market power, but they do not conduct broader consolidation analyses.

We found numerous examples of defense-related M&A that potentially presented risks to DOD, but which IBP did not identify for a DOD assessment.

- Our comparison of IBP's list of assessed M&A with a commercially available list of defense-related mergers from fiscal year 2018 through fiscal year 2022 found that IBP did not initiate a DOD assessment for at least 17 M&A with a defense equity that were above the HSR transaction threshold.[32] IBP officials told us that while they could not provide a specific reason as to why DOD did not assess these specific M&A, they were probably unaware of the M&A at the time or the antitrust agencies did not request their input during the HSR process. In that regard, FTC officials told us that they could not find evidence that they reached out to DOD on those M&A that FTC reviewed. DOJ officials stated that they did not track M&A for which they sought DOD's input.
- Our comparison of IBP's list of assessed M&A with a commercially available list of defense-related mergers from fiscal years 2018 through 2022 also found that IBP did not assess at least 13 smaller-dollar-value M&A involving companies with a defense equity. For example, IBP's records indicate that DOD did not assess a $36 million acquisition of a sub-tier supplier that provides computing capabilities to multiple defense programs. IBP officials stated that they likely did not assess these M&A because IBP and the stakeholders were not aware of them.
- In at least one other instance, DOD did not participate in the initial antitrust review for a high-dollar-value M&A but did provide input during the second request. IBP officials told us that the antitrust agencies sometimes do not realize that DOD is an affected customer until later in the antitrust review process, such as during the second request. While DOD did not have data on the number of instances in which it only participated during the second request, our analysis of nine illustrative examples of M&A assessed by DOD found one such

[32]We obtained commercially available Bloomberg data on M&A where at least one party in the transaction was in the aerospace and defense sector. However, these data were not an exhaustive list of all DOD suppliers and their M&A, so our analysis identifies the minimum number of M&A above the HSR transaction threshold that were not assessed by IBP. DOD's definition of the defense industrial base includes not only aerospace and defense suppliers, but suppliers in other sectors, as well. See appendix I for more information about our analysis of Bloomberg M&A data.

instance. In this case, IBP was not aware of an ongoing merger involving a DOD prime contractor until an antitrust agency contacted DOD during the second request, when the antitrust agency recognized the defense equity. IBP initiated DOD's assessment of that M&A over a year after the companies publicly announced their merger. The majority of M&A proceed after the initial review, so not getting involved early in the antitrust review presents the risk that M&A are proceeding without DOD's input.

Collectively, these examples underscore that IBP does not always identify defense-related M&A, which means M&A that could present risks to the defense industrial base are proceeding without assessment by DOD. Until IBP and DOD stakeholders receive clear direction on how to prioritize M&A involving major defense suppliers that need to be assessed, such as those in critical supply chains, and IBP assesses whether it has adequate staff resources to carry out its responsibilities, DOD will likely continue to miss opportunities to assess M&A that may pose a risk to the defense industrial base.

DOD M&A Assessments Do Not Consistently Evaluate All Types of Risks and Benefits

IBP and DOD stakeholders primarily focus on evaluating competition risks during M&A assessments, even though DOD's M&A policy calls for the consideration of a broader range of potential risks and benefits. According to DOD policy, DOD's M&A assessments must consider a variety of effects, such as effects on competition, national security, and innovation.[33] In practice, however, we found that DOD did not consistently assess all of these types of potential effects. IBP officials and DOD stakeholders we spoke with said they assess competition risks, but the extent to which they assess other types of risks and benefits, if any, varies.

In our analysis of nine M&A assessments selected as illustrative examples, we found that DOD primarily assessed competition risks and less consistently evaluated other types of risks and benefits, including innovation effects, national security effects, and DOD benefits, such as potential cost savings. Table 2 summarizes the types of effects identified in DOD's M&A policy and how frequently DOD stakeholders assessed those effects in the nine illustrative examples we selected.

[33]DOD, DOD Directive 5000.62, Para. 1.2.a.

Table 2: Types of Effects Evaluated in a Selection of Nine DOD Merger and Acquisition (M&A) Assessments

Types of effects that must be assessed, per DOD policy	Number of M&A assessments in which DOD stakeholders specifically evaluated each type of effect
National security effect[a]	0 of 9
Industrial and technological base effect[b]	4 of 9
Innovation effect[c]	1 of 9
Effect on competition for DOD contracts and subcontracts, including future programs and technologies of interest to DOD	9 of 9
Restriction or impaired access of a critical supplier to a competitor, or restriction or impaired market access by a supplier	2 of 9
Benefits for DOD, including anticipated cost savings	1 of 9
Risks to the financial stability and continued stewardship of critical military capabilities, including anticipated increased costs	2 of 9
Risks to the satisfactory completion of current or future DOD programs or operations	4 of 9
Effect on DOD access to affordable or innovative sources, including impediments to obtain essential data rights	1 of 9
Other potential issues[d]	7 of 9

Source: GAO analysis of Department of Defense (DOD) Directive 5000.62 and DOD information from nine illustrative examples. | GAO-24-106129

Note: DOD's M&A policy states that assessments must consider each of the risks and benefits listed above, and when applicable, assessments must be conducted in cooperation with antitrust agencies under section 18a, title 15 of the U.S. Code (pertaining to premerger notification and waiting periods under the Hart-Scott-Rodino Act). DOD coordinated its assessments with antitrust agencies for seven of the nine examples we reviewed.

[a]For example, a DOD stakeholder said that a national security risk would be created if a commercial company acquired a defense supplier and closed the production line supporting DOD programs. Industrial Base Policy officials, for their part, consider the national security risk type to be represented by the other risks identified in the policy, even though DOD's M&A policy identifies national security as a separate and distinct risk to be assessed.

[b]According to DOD stakeholders, a merger or acquisition could create an industrial and technological base effect if, for example, it enabled the companies to offer their customers a wider selection of products or broader range of expertise.

[c]DOD stakeholders said a merger or acquisition could affect innovation if, for example, the companies would be able to pool their resources and increase their investment in research and development.

[d]Other potential issues include any additional risks to the public interest. Examples of such issues are foreign ownership risks or effects on pre-existing DOD industrial base investments.

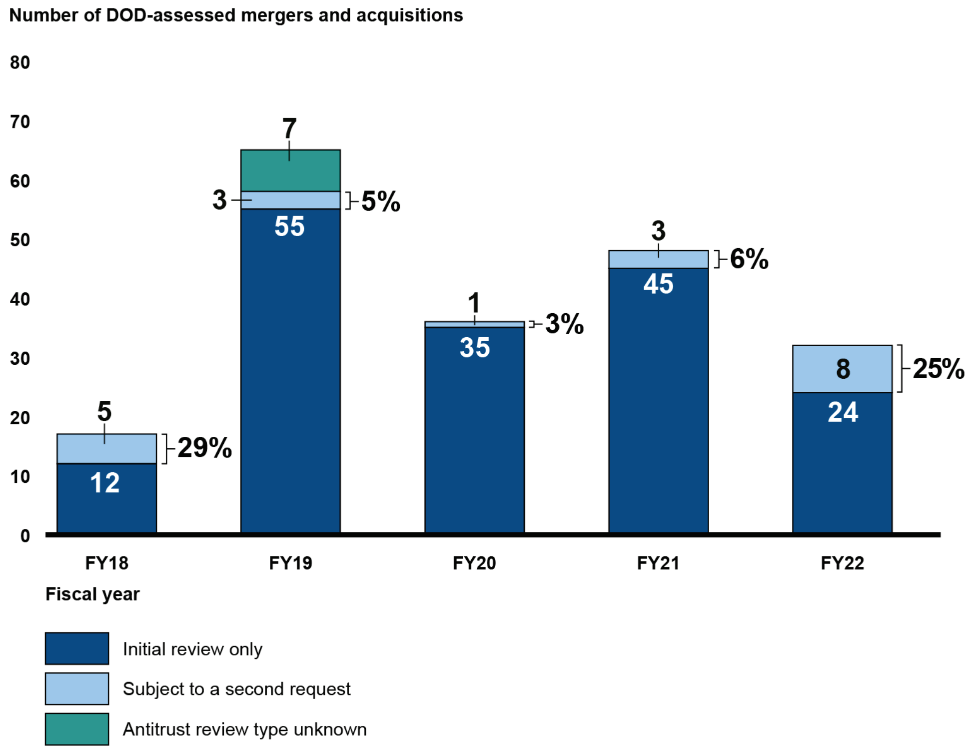
Among our illustrative examples, competition risks were the only type of risk or benefit that DOD stakeholders said they assessed in all nine cases. In two of those examples, DOD stakeholders did not assess any other risks or benefits beyond competition. DOD stakeholders also did not identify national security as a specific risk in any of the documentation we reviewed or interviews we conducted for our illustrative examples. One of the DOD stakeholders we spoke with said it did not evaluate national security concerns during its M&A assessments, while two other stakeholders said that risks not related to competition, such as national security risks, are generally not in the scope of their M&A assessments. IBP officials stated that while national security was not specifically assessed as a distinct risk type, as is required by the policy, in practice, they consider every other risk identified to represent a potential national security risk.

We found that DOD stakeholders do not consistently assess the full range of risks and benefits identified in DOD policy because of direction they receive from IBP to focus on competition risks. IBP officials and some DOD stakeholders said that because DOD's M&A assessments often occur in support of antitrust reviews, this influences how they assess the potential risks. In particular, they focus on competition because this is the only type of risk the antitrust agencies review and can take enforcement action to address.

IBP officials said that when they initiate a DOD M&A assessment in response to an antitrust agency request for input, they have to ensure that the DOD assessment, at a minimum, collects information on potential competition risks that the antitrust agencies requested. The initial phase of an antitrust review is short, so IBP and antitrust agency officials said the antitrust agencies generally request that IBP provide DOD's initial input within 2 weeks or less.[34] Given the limited time available for the DOD assessment, IBP officials said they and DOD stakeholders prioritize their M&A assessment efforts on the competition risks the antitrust agencies asked them to assess. IBP officials and DOD stakeholders said they often save their assessment of potential benefits and risks not related to competition for the second request stage of an antitrust review, if one occurs. Second requests, however, occurred for approximately 10 percent of the M&A that DOD assessed between fiscal years 2018 and 2022, as shown in figure 3. Therefore, in most instances, IBP and DOD stakeholders did not evaluate other types of risks and benefits once their initial assessment was complete.

[34]The HSR Act generally requires merging companies subject to the premerger notification requirements to wait for 30 days after the antitrust agencies receive notification and before merging, with some exceptions. See 15 U.S.C. § 18a(b)(1). During this period, antitrust agencies review the filing for potential antitrust issues. During the 2 weeks or less that the antitrust agencies generally provide for DOD to submit input on the merger or acquisition under review, IBP officials said they conduct initial research, solicit input from affected DOD stakeholders, and develop a consolidated DOD position to communicate to the antitrust agencies. IBP and DOD stakeholders said the stakeholders generally have 5 to 10 days within this 2-week period to gather information and conduct their analysis.

Figure 3: Type of Antitrust Review for DOD-Assessed Mergers and Acquisitions, Fiscal Years 2018-2022



Source: GAO analysis of Department of Defense (DOD) data. | GAO-24-106129

IBP recently made a change in how it solicits input from stakeholder during M&A assessments. During M&A assessments, IBP uses a questionnaire to request input from DOD stakeholders.[35] The questionnaire that IBP used until the end of fiscal year 2022 specifically asked stakeholders to provide information on the potential competition effects the merger or acquisition posed for DOD programs and their suppliers. The questionnaire did not include assessment questions about any of the risks and benefits identified in the policy that are not related to competition. All of the DOD stakeholders we spoke with stated that IBP's competition-focused questionnaire was a major determinant of the types of analysis they conducted to develop their inputs for M&A assessments. We found in our nine illustrative examples that the DOD stakeholders involved in those M&A assessments focused their analysis on identifying

[35]IBP uses the same questionnaire regardless of whether the DOD assessment is being carried out in support of an antitrust review or on DOD's own initiative.

AR_003232

competition risks and evaluated the scale and scope of their contracts with the merging companies, the effect on competition dynamics in the relevant market, and the availability of substitute goods or services from competitors, among other competition-related analyses.

In fiscal year 2023, IBP began using a new stakeholder questionnaire during M&A assessments that aligns more closely with DOD's policy and prompts stakeholders to consider all types of risks and benefits identified in DOD's M&A policy. In addition to questions about potential competition risks, the new questionnaire now also asks stakeholders to discuss potential national security effects, innovation effects, cost risks, and potential benefits, among other things. For example, the new questionnaire prompts stakeholders to describe potential effects of the merger or acquisition that could impair or enhance national security.

IBP officials said they are also developing a new DOD instruction to help improve the implementation of DOD's M&A assessments, but do not have an estimate of when it will be completed. IBP officials have not yet finalized this new instruction, but they plan for it to supplement DOD's existing M&A policy and provide additional guidance on how to operationalize the assessment requirements established in the policy. According to IBP officials, they intend for this instruction to increase the standardization and rigor of DOD's M&A assessments, including how they and DOD stakeholders assess all of the potential risks and benefits identified in the policy.

IBP's efforts to revise their stakeholder questionnaire and create a new DOD instruction demonstrate IBP's recognition that DOD needs to do more to assess the full range of risks and benefits identified in DOD policy. The new DOD instruction that IBP is currently developing may be able to provide this additional direction, but it is too soon to tell what will be in that instruction and how IBP and DOD stakeholders will implement it. Until IBP and DOD stakeholders routinely assess the full range of risks and benefits identified in DOD policy during their M&A assessments, there will continue to be a chance that they are missing potential M&A risks that DOD needs to address.

DOD's Supporting Role to Antitrust Agencies Influences How It Conducts M&A Assessments

DOD has a supporting role in antitrust reviews, which affects the information it has access to when conducting its M&A assessments and its ability to determine how competition risks are mitigated. When developing DOD's inputs for antitrust reviews, IBP and DOD stakeholders are generally not able to access the large amounts of information the antitrust agencies collect on the merging companies and the markets in which they operate. IBP and DOD stakeholders can, however, leverage a number of DOD and publicly available information sources, such as contracting data and insights from DOD subject matter experts. DOD also does not determine the outcome of an antitrust review, such as deciding if an enforcement action is warranted to prevent competitive harm. Instead, DOD's input during antitrust reviews is focused on identifying potential competition effects. IBP and DOD stakeholders occasionally provide feedback on potential enforcement actions being considered by the antitrust agencies to mitigate those risks, when the antitrust agencies request they do so.

DOD Does Not Have Access to All Information Available to Antitrust Agencies When Conducting Its M&A Assessments

When conducting M&A assessments, IBP and DOD stakeholders collect data from a number of internal DOD and external publicly available information sources. Officials from IBP and DOD stakeholder organizations, such as the military departments and Defense Contract Management Agency (DCMA), said the information sources they leverage during their M&A assessments include DOD contracting data, internal data on suppliers, institutional knowledge of subject matter experts, and public data sources such as financial analysis subscription services. IBP and DOD stakeholder officials explained that contracting data, for example, help them determine the potential scope and magnitude of DOD's risk exposure. In particular, IBP and DOD stakeholders are able to use contracting data to assess the programs that could be affected by the M&A, whether there was competition for the companies' contracts, and the size of the companies' contracts. Additionally, IBP officials and stakeholders in the military departments said that DOD subject matter experts provide key insights during M&A assessments. These insights include information on the potential effects for acquisition programs, the dynamics of particular sectors of the defense industrial base, the state of competition in specific markets, and future DOD acquisition needs.

We found that the information available to IBP and DOD stakeholders drives the nature and extent of their analyses during M&A assessments. For example, since IBP and DOD stakeholders rely on DOD's internal contracting and supplier data, their insights into DOD's potential risk exposure is dependent upon where the merging companies are in DOD's supply chains. Officials from IBP, the military departments, and DCMA

AR_003234

said that while they have robust information on prime contractors, they have less information on most of the sub-tier suppliers in the supply chains supporting DOD programs. Additionally, IBP and DOD stakeholders said DOD's contracting data help them assess how much business DOD programs have with the merging companies, but these data do not provide them with broader insights into the merging companies' shares of the relevant market. As a result, DOD stakeholder officials with whom we spoke said they do not have complete market share information and therefore cannot use the Herfindahl-Hirschman Index during their assessments.[36] This index is a widely accepted metric used to evaluate the level of consolidation in a given market and assess how a merger or acquisition would affect future consolidation.

While the antitrust agencies collect a substantial amount of information during their antitrust reviews, antitrust and IBP officials said the antitrust agencies generally cannot share all of this information with DOD due to confidentiality restrictions established in statute.[37] The information collected by the antitrust agencies during an antitrust review can include the structure of the merger or acquisition, certain company financial data, the types of products and services the companies provide, the geographic areas in which they operate, and their history of M&A, among other things. The antitrust agencies may also collect information such as customer lists, sales data, market share data, research and development plans, production information, and competition assessments. The antitrust agencies can use this information in their own analyses to evaluate

[36]The Herfindahl-Hirschman Index is based on market share analyses and provides one way to evaluate if a merger or acquisition may raise competitive concerns. The higher the post-merger index and the higher the increase in the index, the greater the potential for competitive concerns.

[37]The HSR Act provides that any information or documentary material filed with FTC or the Assistant Attorney General is exempt from disclosure under the Freedom of Information Act (5 U.S.C. § 552), and the information may not be made public except as may be relevant to an administrative or judicial action or proceeding. See 15 U.S.C. § 18a(h). According to DOJ officials, statutes that govern information the antitrust agencies gather from other interested parties also restrict the agencies' ability to share the information with outside parties. Antitrust agency and IBP officials said there are occasionally special circumstances under which the merging companies will sign a confidentiality waiver to permit the antitrust agencies to share their information with DOD, such as during an antitrust review involving a large defense prime contractor. In these special cases, antitrust officials said the information sharing would be limited to IBP officials; DOD stakeholders would still not have access to the information. DOD's M&A policy directs DOD to conduct M&A assessments under strict confidentiality with regard to proprietary information and in accordance with any confidentiality agreements between DOD's Office of the General Counsel and the major defense suppliers or other interested parties.

AR_003235

potential competition risks from the proposed M&A and to supplement the inputs provided by DOD and other interested parties. For example, the antitrust agencies often use their access to market share data collected from the merging companies and other companies in the industry to calculate the Herfindahl-Hirschman index.

DOD Does Not Decide How Competition Risks Will Be Mitigated by Antitrust Agencies

IBP and DOD stakeholders have largely focused on evaluating competition risks during their M&A assessments, as discussed above, but they do not have a decision-making role in determining how these competition risks will be mitigated by the antitrust agencies. DOD participates in antitrust reviews in the role of an affected “customer” of the companies involved in the M&A, rather than in a decision-making role. In this supporting role, DOD provides input to the antitrust agencies on the M&A’s potential competition risks for the defense industrial base and DOD programs. The antitrust agencies then decide if the M&A under review will be subjected to enforcement action. In a 2016 joint statement on preserving competition in the defense industry, the antitrust agencies noted that DOD is in a unique position to assess the potential implications of defense M&A, and that they give DOD’s input substantial weight during their reviews. According to the antitrust agencies, DOD’s perspective is valuable because it is often the only customer for products and services offered by defense companies. The antitrust agencies noted in their joint statement, however, that they ultimately determine whether a defense merger or acquisition should be challenged, not DOD.[38]

At the conclusion of an antitrust review, the antitrust agencies determine if any of the identified competition risks—including those risks identified by IBP and DOD stakeholders—are significant enough to warrant enforcement action to mitigate their effects. The antitrust agencies’ enforcement actions could include, for example, seeking an injunction to block the M&A or negotiating a settlement with the companies that requires them to divest certain lines of business to other companies to remedy the competition risk.

According to DOD’s M&A policy, DOD can recommend actions to mitigate the risks of a merger or acquisition if requested to do so by the antitrust agencies.[39] According to IBP and DOD stakeholder officials, however, it is

[38]Department of Justice and Federal Trade Commission, *Joint Statement of the Department of Justice and the Federal Trade Commission on Preserving Competition in the Defense Industry*, Matter Number P130500 (Washington, D.C.: Apr. 12, 2016).

[39]DOD, DOD Directive 5000.62.

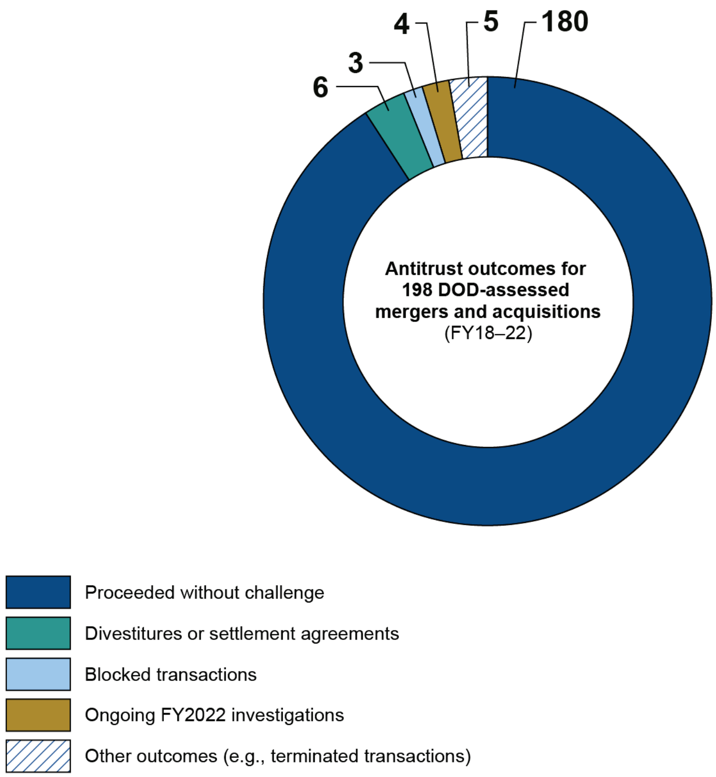
rare for the antitrust agencies to request an official DOD recommendation on specific enforcement actions to mitigate the risks from a merger or acquisition. IBP officials said DOD typically defers to the antitrust agencies' expertise and experience in determining the best course of action to mitigate the risks that they and DOD stakeholders identified during their M&A assessments. Instead, DOD and antitrust agency officials said the antitrust agencies will often discuss potential enforcement actions antitrust officials are considering with IBP and DOD stakeholders and ask for their feedback on the extent to which such measures would address the risks they identified.

Officials from IBP and DOD stakeholder organizations also said the antitrust agencies have not consistently notified DOD about the final outcome of their antitrust reviews and the enforcement actions they decided to pursue to mitigate the risks DOD identified, if any. IBP officials and DOD stakeholders said they instead try to learn about the outcomes and any enforcement actions to mitigate identified risks through news reports or public announcements made by the antitrust agencies and the companies. Among our five illustrative examples for which there was a related antitrust review, DOD officials learned of the review's outcome from a public information source in all but one case. DOD and antitrust officials said that DOD has historically not been privy to this decision information due to antitrust agencies' concerns about the confidentiality of the information. FTC officials also said their internal processes—in which the outcome of an antitrust review is not decided until the FTC Commissioners vote on it—limits their ability to notify DOD before the commissioners publicly announce their decision. However, IBP officials said that DOJ, which is the antitrust agency with which DOD most frequently interacts, recently agreed to start sharing information about the outcomes of defense-related antitrust reviews with DOD.

Among the defense-related M&A that DOD assessed in the past 5 years, few were subjected to an enforcement action by the antitrust agencies. Figure 4 summarizes the outcomes for the M&A that DOD assessed from fiscal years 2018 through 2022.

AR_003237

Figure 4: Outcomes for Mergers and Acquisitions Assessed by the Department of Defense (DOD), FY 2018-2022



Source: GAO analysis of Department of Defense data. | GAO-24-106129

Note: As of May 2023, DOD officials said they did not yet know the outcome of four of the M&A that DOD assessed in fiscal year (FY) 2022 and they were likely still under review by the antitrust agencies.

As shown in figure 4 above, more than 90 percent of the M&A that DOD assessed between fiscal years 2018 and 2022 were not challenged by the antitrust agencies. IBP officials said that in the uncommon cases where the antitrust agencies pursued enforcement action, the antitrust agencies usually determined that divestures were the most effective means to mitigate the identified competition risks. When FTC filed a suit against an acquisition involving two defense contractors in 2022, it stated in a press release that it was the first defense-related case FTC had litigated in decades.[40]

DOD Generally Does Not Monitor the Effects of Completed M&A on the Industrial Base

DOD has limited efforts underway to monitor the effects of M&A on the defense industrial base and determine if any of the potential risks identified by IBP or DOD stakeholders during their assessments were realized. According to IBP officials and stakeholders from the military departments that we met with, they monitor the outcome of M&A only if the antitrust agencies ask them to do so, which is rare. In the past 10 years, the antitrust agencies have asked DOD to monitor the outcomes of two M&A out of all the antitrust reviews for which DOD has provided input. DOD and antitrust agency officials we met with said there are particular circumstances under which the antitrust agencies will ask DOD to assist with the monitoring of M&A—namely, when an antitrust review results in a long-term agreement for a defense company to engage in certain behaviors to maintain competition.[41] Since antitrust reviews focus exclusively on competition risks, these monitoring efforts are limited to a merger or acquisition's effect on competition in the defense industrial base. Other types of risks and benefits—such as the merger or acquisition's effect on national security—are not the focus of DOD's monitoring in these cases.

In the two cases in which antitrust agencies asked DOD to monitor the outcome of an antitrust review, DOD helped monitor compliance with the agreement negotiated by the antitrust agency to mitigate identified competition risks. For example, in one of these cases, FTC asked DOD to participate in the monitoring effort for a 2018 agreement involving two defense companies in the missile sector.[42] In this case, a large company was acquiring a critical supplier of missile components and FTC

[40]Federal Trade Commission, *For Release: FTC Sues to Block Lockheed Martin Corporation's $4.4 Billion Vertical Acquisition of Aerojet Rocketdyne Holdings Inc.* (Washington, D.C.: Jan. 25, 2022).

[41]The antitrust agencies refer to these types of long-term agreements between the government and the merging companies as behavioral remedies. The structure of the behavioral remedy depends on the circumstances of each M&A and the competition risks that need to be mitigated. For example, if one company is acquiring a key supplier in its and its competitors supply chains, the antitrust agencies may negotiate a behavioral remedy that requires the acquiring company to maintain its competitors' access to the supplier or to separate the management of the supplier from the management of the larger company to preserve the supplier's independence.

[42]In the other case, DOD helped FTC monitor a 2007 agreement involving two aerospace companies that were forming a joint venture. That antitrust agreement terminated in 2017, so DOD is no longer monitoring it.

AR_003239

determined there was a risk the acquiring company would restrict or disadvantage its competitors' access to the supplier, thereby reducing their ability to compete. For a period of 20 years, designated officials within DOD will monitor the behavior of the acquiring company to see if it unfairly disadvantages its competitors by restricting their access to the goods, services, and information of the critical supplier.[43] To carry out this monitoring, DOD will be able to review compliance reports from the companies involved in the acquisition, conduct interviews with relevant company personnel, inspect company documents and facilities, and review complaints made by the companies' competitors or other outside parties, among other things.

Beyond these two monitoring efforts, however, IBP officials and stakeholders in the military departments said they do not proactively monitor the effects of M&A to determine if the potential risks they assessed were realized. For all nine of our illustrative examples, the IBP and DOD stakeholder officials we spoke with confirmed they did not monitor the effects of the merger or acquisition once they concluded their assessment. This was the case even in two examples where IBP or DOD stakeholder officials determined during the assessment that further monitoring was warranted because potential risks existed. In these two examples, some stakeholders found in their initial M&A assessments that ongoing consolidation was creating potential competition risks in the relevant market. In both of these cases, the antitrust agency, IBP, and stakeholder officials eventually concluded upon further analysis that the competition risks associated with the merger or acquisition were not significant enough to merit antitrust intervention or DOD mitigation efforts at that time. Instead, the DOD and antitrust agency officials noted a need for DOD to monitor these M&A for evidence of future competition concerns or additional consolidation involving the companies. According to the IBP and DOD stakeholder officials we spoke with, however, they did not monitor either of these M&A to determine if the risks they were concerned about were realized.

In the absence of dedicated monitoring efforts, IBP officials and stakeholders in the military departments we spoke with said they sometimes learn about realized negative effects on the industrial base if a program office encounters issues with the merged company, such as rising costs or declining quality. In such cases, officials said the affected

[43]According to IBP officials, IBP currently leads the DOD monitoring of this agreement, with support from DOD General Counsel and other DOD stakeholders, as appropriate.

program will raise the challenges they are experiencing through DOD's acquisition oversight process, which is a separate process from DOD's M&A assessments. For instance, in one of our illustrative examples, DOD stakeholders said they learned that the potential risks they had identified during an M&A assessment were actually occurring when acquisition programs and contract administration offices working with the relevant companies began observing and reporting quality and production issues.

We found that officials in IBP and stakeholders in the military departments are generally not monitoring the actual effects of M&A unless asked by the antitrust agencies because there is not a requirement for them do so in DOD's M&A policy or in military department guidance we reviewed. Instead, as described above, IBP focuses DOD's efforts on assessing high-value M&A in response to antitrust agency requests for input. According to *Standards for Internal Control in the Federal Government*, government agencies should design and implement control activities to achieve objectives and respond to risks. This includes, for example, monitoring the status of risks and documenting responsibility for monitoring in policy.[44] Although DOD has an M&A assessments policy and some of the military departments told us they have additional guidance to supplement the DOD policy, this policy and guidance primarily outline how DOD should conduct assessments to identify potential risks. We found that neither IBP nor the military departments have a requirement in DOD's M&A policy or the additional guidance we reviewed to monitor the actual effects of M&A after they complete their assessments to determine if any of the risks they identified were realized.

DCMA officials were the only stakeholders with whom we spoke who said they attempt to monitor the risks identified in the M&A assessments in which they participated. DCMA officials said they conduct such monitoring because their guidance requires it. In particular, DCMA guidance for defense industrial base monitoring and reporting assigns DCMA's Industrial Analysis Division with responsibility for monitoring the effectiveness of industrial base risk mitigation measures, including those related to M&A.[45] DCMA Industrial Analysis Division officials said their subject matter experts are tasked with maintaining awareness of the potential risks identified in M&A assessments and how these risks are

[44]GAO-14-704G.

[45]Defense Contract Management Agency, *Defense Industrial Base Monitoring and Reporting,* DCMA Manual 3401-05 (Dec. 6, 2018) (incorporating change 1, Dec. 22, 2020).

AR_003241

affecting DOD programs. To determine if any of the identified risks have been realized and affected DOD programs, DCMA officials said these subject matter experts collect information from several sources, including the program offices affected by the merger or acquisition, other DCMA offices, the companies involved in the M&A, and publicly available sources. DCMA's monitoring, however, is limited to only those M&A assessments in which it participated. According to DCMA officials, they generally participate in M&A assessments that involve suppliers for major weapon systems, but do not participate in assessments for other types of suppliers, such as those in the information technology or services sectors. For example, DCMA participated in four of nine of our illustrative examples.

As a result of DOD's limited monitoring efforts, IBP and DOD stakeholders have incomplete insight into the actual effects of defense-related M&A. In the rare cases in which IBP or DOD stakeholders have conducted monitoring, these efforts have been focused on monitoring a merger or acquisition's effect on competition. IBP officials with whom we spoke said that conducting more robust monitoring would help support their efforts to manage M&A risks and there is an opportunity for them to better track the potential risks they and DOD stakeholders identified during their assessments.

Until DOD updates its M&A policy to require monitoring when its assessments identified risks, IBP and DOD stakeholder officials will miss opportunities to determine if the potential risks they identified actually occurred and, in turn, whether there are adverse effects on the defense industrial base that need to be addressed.

Conclusions

DOD has not effectively aligned its concerns about continued industrial base consolidation with the resources and robustness of its efforts to assess M&A risks to its industrial base. In all stages of the M&A assessment process—identifying M&A of potential concern, assessing the risks and benefits, and monitoring the outcomes on the defense industrial base—IBP and DOD stakeholders largely react and respond to requests from the antitrust agencies. This approach is not proactive and does not analyze the full range of risks that defense-related M&A pose to the defense industrial base. This is due, in part, to the fact that DOD has not devoted adequate resources to this high-priority and high-risk area of work. It is also driven by the fact that DOD's policy for M&A assessments does not provide clear direction on which major defense suppliers' M&A DOD should prioritize for assessment. In addition, IBP and DOD stakeholders do not have clear direction on DOD's expectations for assessing the potential risks and benefits of M&A, beyond the competition risks of interest to the antitrust agencies and DOD. Furthermore, DOD's M&A policy does not require IBP and DOD stakeholders to monitor completed M&A and check if any of the potential risks they identified during their assessments were realized. With its current reactive approach, DOD is missing opportunities to proactively identify risky M&A in the defense industrial base and to manage the full range of risks they present for DOD programs.

Recommendations for Executive Action

We are making the following four recommendations to DOD:

The Secretary of Defense should ensure that the Assistant Secretary of Defense for Industrial Base Policy provides clear direction as to which major defense suppliers IBP should prioritize for the purposes of conducting M&A assessments. (Recommendation 1)

The Secretary of Defense should ensure that the Assistant Secretary of Defense for Industrial Base Policy assesses whether its M&A office is adequately resourced to consistently carry out its responsibilities. (Recommendation 2)

The Secretary of Defense should ensure that the Assistant Secretary of Defense for Industrial Base Policy provides the Office of Industrial Base Policy and DOD stakeholders with additional direction on assessing the full range of risks and benefits identified in DOD's M&A policy, such as national security effects, when developing the new DOD instruction or other appropriate guidance. (Recommendation 3)

The Secretary of Defense should ensure that the Assistant Secretary of Defense for Industrial Base Policy revises DOD's M&A policy to direct the Office of Industrial Base Policy, with support from relevant DOD stakeholders, to monitor the effects of concluded mergers or acquisitions in cases in which DOD identified risks during its assessment, to determine if risks were realized or if additional action is needed. (Recommendation 4)

Agency Comments

We provided a draft of this report to DOD, DOJ, and FTC for review and comment. DOD concurred with all four recommendations and described its plans to address them. DOD also provided technical comments, which we incorporated, as appropriate. DOJ did not have any comments on the report. FTC provided technical comments, which we incorporated, as appropriate.

We are sending copies of this report to the appropriate congressional committees, the Secretary of Defense, the Attorney General, and the Chair of the FTC. In addition, the report is available at no charge on the GAO website at https://www.gao.gov.

If you or your staff have any questions about this report, please contact me at (202) 512-4841 or russellw@gao.gov. Contact points for our Offices of Congressional Relations and Public Affairs may be found on the last page of this report. GAO staff who made key contributions to this report are listed in appendix III.

Appendix I: Objectives, Scope, and Methodology

The Joint Explanatory Statement accompanying the National Defense Authorization Act (NDAA) for Fiscal Year 2022 and the Senate Armed Services Committee Report accompanying a bill for the James M. Inhofe NDAA for Fiscal Year 2023 included provisions for GAO to evaluate Department of Defense (DOD) efforts to monitor and assess the effects of potential mergers and acquisitions (M&A) on the defense industrial base, as well as DOD's oversight processes for vetting potential M&A within the defense industrial base.[1] This report addresses (1) the extent to which DOD has insight into defense-related M&A; (2) how DOD's role as a stakeholder to the antitrust agencies affects how it conducts M&A assessments; and (3) the extent to which DOD monitors the effects of M&A on the defense industrial base.

To address the extent to which DOD has insight into defense-related M&A, we reviewed DOD's M&A policy to determine DOD's requirements for identifying and assessing M&A in the defense industrial base.[2] We also reviewed guidance specific to DOD stakeholders, as available, to determine what direction DOD stakeholders have to identify M&A for assessment. To compare DOD's actual implementation of M&A assessments to the requirements established in agency policy, we interviewed DOD officials about methods they use to identify defense M&A and any challenges they encounter in doing so. We also compared DOD's efforts to identify and assess M&A to *Standards for Internal Control in the Federal Government* to evaluate the extent to which its policy and practices aligned with internal control standards for federal entities.[3]

Furthermore, we analyzed Industrial Base Policy (IBP) data on DOD M&A assessments to evaluate how many M&A DOD assessed, how many

[1]The Joint Explanatory Statement accompanying the NDAA for Fiscal Year 2022 included a provision for GAO to assess DOD's actions to monitor and assess the effects of potential mergers and acquisitions on its defense industrial base. See NDAA for Fiscal Year 2022: Legislative Text and Joint Explanatory Statement to Accompany S. 1605, Public Law 117-81 (Dec. 2021). The Senate Armed Services Committee report accompanying a bill for the James M. Inhofe NDAA for Fiscal Year 2023 included a provision for GAO to evaluate DOD's oversight processes for vetting proposed mergers and acquisitions within the defense industrial base. See S. Rep. No. 117-130, at 204 (2022).

[2]Department of Defense*, Review of Mergers, Acquisitions, Joint Ventures, Investments, and Strategic Alliances of Major Defense Suppliers on National Security and Public Interes*t, DOD Directive 5000.62 (Feb. 27, 2017).

[3]GAO, *Standards for Internal Control in the Federal Government*, GAO-14-704G (Washington, D.C.: Sept.10, 2014).

were in response to antitrust reviews, and the outcome of those reviews, among other things. Our analysis of these data covered fiscal years 2018 through 2022, the years for which IBP officials stated they had complete data on the M&A that DOD assessed. We determined IBP's data were sufficiently reliable for the purposes of determining which M&A DOD had assessed in these years. We assessed the reliability of these data through manual data testing, comparisons to commercially available M&A data from Bloomberg, and interviews with DOD officials.[4]

We used commercially available data from Bloomberg to determine how many defense-related M&A occurred in fiscal years 2018 through 2022. We analyzed information from this commercially available data source in an attempt to validate DOD estimates of the number of defense-related M&A that occur annually. When selecting which database to use for this analysis, we considered using government contracting data sources such as the Federal Procurement Data System and SAM.gov databases, as well as other commercial M&A data sources, such as S&P's Capital IQ. We found that none of the available options, including Bloomberg, has readily available information to capture the universe of M&A in the defense industrial base at both the prime contractor and subcontractor level. We chose to use the Bloomberg database due to its demonstrated data reliability through its use in prior GAO reports and additional data reliability testing conducted for this report.

In attempting to determine how many defense-related M&A occurred in fiscal years 2018 through 2022 to validate DOD's data, we used the Bloomberg M&A database's "aerospace & defense" industry classification to collect data on defense M&A. We focused our analysis on M&A where Bloomberg categorized at least one of the companies involved in the M&A as part of the aerospace and defense sector. We used these data to determine a minimum estimate of how many M&A occurred amongst defense-related suppliers in each fiscal year. These data indicated that, on average, there were at least 147 defense-related M&A occurring annually in this period. Bloomberg's aerospace & defense industry classification, however, does not include all defense suppliers. Companies that supply both DOD and commercial customers may be included under other industry classifications. For example, we found that while the aerospace & defense category includes some naval shipbuilders, it does not include other shipbuilders that supply both DOD

[4]DOD officials told us that data from fiscal years before 2018 may be incomplete in part due to problems arising from a server migration and changes in data collection practices.

and commercial markets. As a result, our estimate of the number of defense M&A in fiscal years 2018 through 2022 is a minimum estimate and does not account for M&A among companies that support both defense and commercial customers, such as shipbuilders or semiconductor companies. Given these limitations, we determined that DOD's most recent estimates of the number of defense-related M&A, as reported in the *Fiscal Year 2017 Annual Industrial Capabilities* report, were a more comprehensive estimate. As such, we are using DOD's estimate for the purposes of this report.

We also compared Bloomberg data on aerospace and defense M&A to IBP's data on DOD assessments to assess the extent to which DOD assessed M&A involving aerospace and defense companies in fiscal years 2018 through 2022. Through this analysis, we identified a number of defense-related M&A that DOD did not assess. Since the Bloomberg data did not include all defense suppliers, as noted above, this analysis identified a minimum number of defense-related M&A that DOD did not assess, but is not comprehensive. As a result, when discussing the results of this analysis, we use terms such as "at least" to note that these figures are minimum estimates. After identifying M&A with defense equities that DOD did not assess, we interviewed IBP officials again to discuss why they may not have been aware of such M&A. For M&A that had values that surpassed the applicable Hart-Scott-Rodino Antitrust Improvements (HSR) Act transaction threshold, we also reached out to the antitrust agencies to confirm if DOD had a role in any HSR reviews that may have occurred for such M&A.

To further assess DOD's insight into defense-related M&A, we evaluated the extent to which IBP and DOD stakeholders conducted M&A assessments in alignment with DOD's M&A policy. We reviewed the policy to determine which DOD organizations have a role in conducting M&A assessments and the types of risks and benefits they are expected to assess.[5] We analyzed the questionnaires that IBP used to solicit DOD stakeholder inputs during M&A assessments from fiscal years 2018 to 2023 to determine what risk and benefit information they requested. We also conducted interviews with IBP officials and DOD stakeholders in the military departments and Defense Contract Management Agency (DCMA) to understand how they implement DOD's M&A assessments in practice.

[5]DOD, DOD Directive 5000.62.

To further compare the implementation of DOD's M&A assessments to the requirements in policy, we selected a nongeneralizable sample of nine M&A that DOD assessed between fiscal years 2018 through 2022 as illustrative examples. We selected these examples from a DOD-provided list of all M&A assessments it conducted during these fiscal years, including assessments DOD initiated in response to an antitrust request or on its own initiative. For each example, we analyzed agency documentation and interviewed IBP officials and DOD stakeholders to understand how they conducted these assessments. This included analyzing which stakeholders participated, the types of risks and benefits DOD stakeholders assessed and reported to IBP, and the information sources and analyses they leveraged, among other things. In doing so, we evaluated the extent to which IBP and DOD stakeholders' actual assessment activities aligned with the requirements in DOD's M&A policy, which IBP officials told us is the key policy that guides their assessments. Our selection was generated using several criteria, including representation of a variety of outcomes (proceeded without further review, remedied, or blocked), merger values, and fiscal year of assessment.

Table 3 includes an overview of the nine illustrative examples we selected. The company names are sensitive information and are not included in the table.

Table 3: DOD Merger and Acquisition (M&A) Assessments Selected as Illustrative Examples

	Fiscal year of M&A assessment	Industrial base sector	M&A value above or below transaction thresholds for Hart-Scott-Rodino antitrust review	M&A outcome
Illustrative example 1	2021	Aerospace/Aviation	Above	Antitrust agency sued to block
Illustrative example 2	2018	Industrial Gas	Above	Divestiture of certain lines of business, then allowed to proceed
Illustrative example 3	2019	Aerospace and Defense	Above	Divestiture of certain lines of business, then allowed to proceed
Illustrative example 4	2020	Protective Gear	Above	Proceeded without challenge
Illustrative example 5	2021	Logistics	Above	Proceeded without challenge
Illustrative example 6	2019	Engineered Products	Below	Proceeded without challenge

	Fiscal year of M&A assessment	Industrial base sector	M&A value above or below transaction thresholds for Hart-Scott-Rodino antitrust review	M&A outcome
Illustrative example 7	2020	Systems Engineering	Below	Proceeded without challenge
Illustrative example 8	2022	Navigation and Inertial Sensing	Below	Proceeded without challenge
Illustrative example 9	2022	Aerospace	Below	Proceeded without challenge

Source: GAO analysis of Department of Defense (DOD) data. | GAO-24-106129

To address how DOD's role as a stakeholder to the antitrust agencies affects its conduct of M&A assessments, we reviewed DOD and antirust agencies' policy and guidance to determine how DOD is expected to support antitrust reviews led by the Department of Justice (DOJ) and Federal Trade Commission (FTC). This included assessing what information DOD is able to access and its role in determining the outcome of an antitrust review. For example, we reviewed DOD's M&A policy and FTC guidance on antitrust reviews conducted under the HSR premerger notification program.[6] We also reviewed federal antitrust statutes to understand how DOJ and FTC's role as enforcement agencies in the antitrust process differs from DOD's role as an interested party affected by the M&A. Furthermore, we reviewed a joint DOJ/FTC statement on DOD's role in antitrust reviews of defense-related M&A.[7] We interviewed DOD and antitrust agency officials to further our understanding of DOD and the antitrust agencies' respective roles and responsibilities, as well as to discuss how DOD's inputs are used in antitrust reviews. We analyzed information from our nine illustrative examples to demonstrate how DOD and the antitrust agencies interacted and shared information during those M&A assessments.

To address the extent to which DOD monitors the effects of M&A on the defense industrial base, we reviewed DOD policy and guidance to determine IBP and DOD stakeholders' requirements for monitoring the effects of M&A, if any. This included, for example, DOD's M&A policy and

[6]DOD, DOD Directive 5000.62. Federal Trade Commission, *Introductory Guide I: What is the Premerger Notification Program?* (March 2009).

[7]Department of Justice and Federal Trade Commission, *Joint Statement of the Department of Justice and the Federal Trade Commission on Preserving Competition in the Defense Industry*, Matter Number P130500 (Apr. 12, 2016).

DCMA Manual 3401-05.[8] To further our understanding, we interviewed IBP officials and DOD stakeholders in the military departments and DCMA about the nature and extent of their M&A monitoring activities. During these interviews, we discussed their monitoring efforts in general and in the context of our nine illustrative examples. We learned that the antitrust agencies can assign DOD officials a role in monitoring long-term behavioral agreements negotiated during antitrust reviews, so we collected a list of DOD's monitoring assignments from fiscal years 2012 through 2022 from the antitrust agencies. For these antitrust monitoring assignments, we reviewed the terms of the final agreement between the antitrust agency and the merging companies to determine DOD's responsibilities for monitoring compliance with the long-term behavioral agreement. We interviewed IBP and stakeholder officials involved in these antitrust monitoring assignments to determine how DOD conducts monitoring and ensures compliance with the antitrust agencies' behavioral agreements. Finally, we compared DOD's monitoring activities to *Standards for Internal Control in the Federal Government* to evaluate the extent to which DOD monitoring practices aligned with internal control standards for federal entities.[9]

We conducted this performance audit from June 2022 to October 2023 in accordance with generally accepted government auditing standards. Those standards require that we plan and perform the audit to obtain sufficient, appropriate evidence to provide a reasonable basis for our findings and conclusions based on our audit objectives. We believe that the evidence obtained provides a reasonable basis for our findings and conclusions based on our audit objectives.

Appendix II: Comments from the Department of Defense

THE UNDER SECRETARY OF DEFENSE
3010 DEFENSE PENTAGON
WASHINGTON, DC 20301-3010

ACQUISITION AND SUSTAINMENT

SEP 22 2023

Mr. Bill Russell
Director, GAO Contracting and National Security Acquisition
U.S. Government Accountability Office
441 G Street, NW
Washington, DC 20548

Dear Mr. Russell:

Attached please find the Department of Defense (DoD) response to GAO Draft Report GAO-23-106129, "Defense Industrial Base: DoD Needs Better Insight Into Risks From Mergers and Acquisitions" dated September 2023 (GAO Code 106129).

The Department has conducted a security review of the draft GAO report and found no issues with public release of the draft report.

Sincerely,

WA LaPlante

William A. LaPlante

GAO DRAFT REPORT DATED SEPTEMBER 2023
GAO-23-106129 (GAO CODE 106129)

"DEFENSE INDUSTRIAL BASE: DOD NEEDS BETTER INSIGHT INTO RISKS FROM MERGERS AND ACQUISITIONS"

DEPARTMENT OF DEFENSE COMMENTS TO GAO RECOMMENDATIONS

RECOMMENDATION 1: The GAO recommends that the Secretary of Defense ensure that the Assistant Secretary of Defense for Industrial Base Policy (IBP) provides clear direction as to which major defense suppliers IBP should prioritize for the purposes of conducting mergers and acquisitions (M&A) assessments.

DoD RESPONSE: Concur. IBP intends to promulgate a new Department of Defense Instruction (DoDI) to provide guidance on conducting assessments of M&A transactions. This new DoDI will incorporate direction on prioritizing assessments.

RECOMMENDATION 2: The GAO recommends that the Secretary of Defense ensures that the Assistant Secretary of Defense for Industrial Base Policy assesses whether its M&A team is adequately resourced to consistently carry out its responsibilities.

DoD RESPONSE: Concur. IBP currently executes the M&A mission without dedicated funding. This includes M&A assessments, due diligence, and serving as the Compliance Officer and Government Compliance Team lead on the monitoring of an FTC consent order. However, IBP has developed issue papers and is requesting dedicated funding in support of DoD's Fiscal Year 2025 Program Objective Memorandum (POM) and annual increases thereafter that will allow IBP to increase M&A workforce and resources. IBP plans to conduct an additional assessment on the resources required to fulfill GAO's recommendation to expand DoD M&A activities.

RECOMMENDATION 3: The GAO recommends that the Secretary of Defense ensures that the Assistant Secretary of Defense for Industrial Base Policy provides the Office of Industrial Base Policy and DoD stakeholders with additional direction on assessing the full range of risks and benefits identified in DoD's M&A policy, such as national security, when developing the new DoD instruction or other appropriate guidance.

DoD RESPONSE: Concur. DoD's policy on M&A reviews, DoDD 5000.62 effective 27 February 2017, provides 13 factors that it must consider when assessing the potential implications of covered M&A transactions. IBP intends to provide more detailed guidance in the forthcoming DoDI as to assessing the full range of risks and benefits to the DoD. IBP will also update its processes and tools to ensure that it is consistent with any revision to policy. IBP expects to complete a draft of the DoDI in the next few months and begin coordination shortly thereafter.

AR_003253

RECOMMENDATION 4: The GAO recommends that the Secretary of Defense ensure that the Assistant Secretary of Defense for Industrial Base Policy revises DoD's M&A policy to direct the Office of Industrial Base Policy, with support from relevant DoD stakeholders, to monitor the effects of conducted mergers or acquisitions in cases in which DoD identified risk during its assessment to determine if risks were realized or if additional action is needed.

DoD RESPONSE: Concur. DoD currently supports the Federal Trade Commission (FTC) in monitoring a major defense firm in its compliance of an FTC Consent Order governing the terms of its acquisition of a key component supplier. DoD does not currently monitor transactions beyond those identified by the FTC or the Department of Justice, but concurs with GAO's recommendation and will assess the design and implementation of a M&A monitoring mission and resources needed to support it to include those transactions with identified risks. The forthcoming DoDI will incorporate guidance on evaluating identified risks after transactions have closed.

Appendix III: GAO Contact and Staff Acknowledgments

GAO Contact

W. William Russell, (202) 512-4841 or russellw@gao.gov

Staff Acknowledgments

In addition to the contact named above, Justin Jaynes (Assistant Director), Jillian Schofield (Analyst-in-Charge), Peter Anderson, Vinayak Balasubramanian, Brandon Booth, Donna Calderone, Gioia Chaouch, Lorraine Ettaro, Kurt Gurka, Anne Kolesnikoff, Alec McQuilkin, Pamela Snedden, Alyssa Weir, and Adam Wolfe made key contributions to this report.

Seto Bagdoyan, Michael E. Clements, Joseph Cruz, Kimberly Gianopoulos, Gretta Goodwin, Heather Dunahoo, Julia Vieweg, and Christina Werth also provided support to this report.

GAO's Mission

The Government Accountability Office, the audit, evaluation, and investigative arm of Congress, exists to support Congress in meeting its constitutional responsibilities and to help improve the performance and accountability of the federal government for the American people. GAO examines the use of public funds; evaluates federal programs and policies; and provides analyses, recommendations, and other assistance to help Congress make informed oversight, policy, and funding decisions. GAO's commitment to good government is reflected in its core values of accountability, integrity, and reliability.

Obtaining Copies of GAO Reports and Testimony

The fastest and easiest way to obtain copies of GAO documents at no cost is through our website. Each weekday afternoon, GAO posts on its website newly released reports, testimony, and correspondence. You can also subscribe to GAO's email updates to receive notification of newly posted products.

Order by Phone

The price of each GAO publication reflects GAO's actual cost of production and distribution and depends on the number of pages in the publication and whether the publication is printed in color or black and white. Pricing and ordering information is posted on GAO's website, https://www.gao.gov/ordering.htm.

Place orders by calling (202) 512-6000, toll free (866) 801-7077, or TDD (202) 512-2537.

Orders may be paid for using American Express, Discover Card, MasterCard, Visa, check, or money order. Call for additional information.

An official website of the United States government Here's how you know

Market research and competitive analysis

Market research helps you find customers for your business. Competitive analysis helps you make your business unique. Combine them to find a competitive advantage for your small business.

Content

Use market research to find customers

Use competitive analysis to find a market advantage

Free small business data and trends

Use market research to find customers

Market research blends consumer behavior and economic trends to confirm and improve your business idea.

It's crucial to understand your consumer base from the outset. Market research lets you reduce risks even while your business is still just a gleam in your eye.

Gather demographic information to better understand opportunities and limitations for gaining customers. This could include population data on age, wealth, family, interests, or anything else that's relevant for your business.

Then answer the following questions to get a good sense of your market:

- **Demand:** Is there a desire for your product or service?
- **Market size:** How many people would be interested in your offering?
- **Economic indicators:** What is the income range and employment rate?
- **Location:** Where do your customers live and where can your business reach?
- **Market saturation:** How many similar options are already available to consumers?
- **Pricing:** What do potential customers pay for these alternatives?

You'll also want to keep up with the latest small business trends. It's important to gain a sense of the specific market share that will impact your profits.

You can do market research using existing sources, or you can do the research yourself and go direct to consumers.

Existing sources can save you a lot of time and energy, but the information might not be as specific to your audience as you'd like. Use it to answer questions that are both general and quantifiable, like industry trends, demographics, and household incomes. Check online or start with our list of market research resources.

Asking consumers yourself can give you a nuanced understanding of your specific target audience. But, direct research can be time consuming and expensive. Use it to answer questions about your specific business or customers, like reactions to your logo, improvements you could make to buying experience, and where customers might go instead of your business.

Here are a few methods you can use to do direct research:

- Surveys
- Questionnaires
- Focus groups
- In-depth interviews

For guidance on deciding which methods are worthwhile for your small business, the U.S. Small Business Administration (SBA) provides counseling services through our resource partner network.

Use competitive analysis to find a market advantage

Competitive analysis helps you learn from businesses competing for your potential customers. This is key to defining a competitive edge that creates sustainable revenue.

Your competitive analysis should identify your competition by product line or service and market segment. Assess the following characteristics of the competitive landscape:

- Market share
- Strengths and weaknesses
- Your window of opportunity to enter the market
- The importance of your target market to your competitors
- Any barriers that may hinder you as you enter the market
- Indirect or secondary competitors who may impact your success

Several industries might be competing to serve the same market you're targeting. The Department of Justice provides a diagram of Porter's Five Forces as one way you can differentiate your competitive analysis by industry. Important factors to consider include level of competition, threat of new competitors or services, and the effect of suppliers and customers on price.

Free small business data and trends

There are many reliable sources that provide customer and market information at no cost. Free statistics are readily available to help prospective small business owners.

Consider the following federal business statistics in your market research and competitive analysis:

Focus	Goal	Reference
General business statistics	Find statistics on industries, business conditions.	• NAICS • U.S. Census Business Builder
Consumer statistics	Gain info on potential customers, consumer markets.	• Consumer Credit Data • Consumer Product Safety
Demographics	Segment the population for targeting customers.	• U.S. Census Bureau • Bureau of Labor Statistics
Economic indicators	Know unemployment rates, loans granted and more.	• Consumer Price Index • Bureau of Economic Analysis
Employment statistics	Dig deeper into employment trends for your market.	• Employment and Unemployment Statistics

Focus	Goal	Reference
Income statistics	Pay your employees fair rates based on earnings data.	• Earnings by Occupation and Education • Income Statistics
Money and interest rates	Keep money by mastering exchange and interest rates.	• Daily Interest Rates • Money Statistics via Federal Reserve
Production and sales statistics	Understand demand, costs and consumer spending.	• Consumer Spending • Gross Domestic Product (GDP)
Trade statistics	Track indicators of sales and market performance.	• Balance of Payments • USA Trade Online
Statistics of specific industries	Use a wealth of federal agency data on industries.	• Statistics of U.S. Businesses

Private Equity Funds

What are private equity funds?

When you invest in a private equity fund, you are investing in a fund managed by a private equity firm—the *adviser*. Similar to a mutual fund (/investing-basics/investment-products/mutual-funds) or hedge fund (/introduction-investing/basics/investment-products/hedge-funds) , a private equity fund is a pooled investment vehicle where the adviser pools together the money invested in the fund by all the investors and uses that money to make investments on behalf of the fund. Unlike mutual funds or hedge funds, however, private equity firms often focus on long-term investment opportunities in assets that take time to sell with an investment time horizon typically of 10 or more years.

A typical investment strategy undertaken by private equity funds is to take a controlling interest in an operating company or business—the *portfolio company*—and engage actively in the management and direction of the company or business in order to increase its value. Other private equity funds may specialize in making minority investments in fast-growing companies or startups.

Although a private equity fund may be advised by an adviser that is registered with the SEC, private equity funds themselves are not registered with the SEC. As a result, private equity funds are not subject to regular public disclosure requirements. Information about a private equity fund's adviser that is registered with the SEC is available here (https://adviserinfo.sec.gov/) .

Who can invest?

A private equity fund is typically open only to *accredited investors* (/additional-resources/news-alerts/alerts-bulletins/investor-bulletin-accredited-investors) and *qualified clients* (https://www.sec.gov/rules/other/2016/ia-4421.pdf) . Accredited investors and qualified clients include institutional investors, such as insurance companies, university endowments and pension funds, and high income and net worth individuals. The initial investment amount for a private equity investment is often very high.

Even if you are not invested in private equity funds directly, you may be indirectly invested in a private equity fund if you participate in a pension plan or own an insurance policy, for example. Pension plans and insurance companies may invest some portion of their large portfolios in private equity funds.

What should I know?

Illiquidity

Because of their long-term investment horizon, an investment in a private equity fund is often illiquid and it may be necessary to hold an investment in a private equity fund for several years before any return is realized. Private equity funds typically impose limitations on investors' ability to withdraw their investment. Investors in private equity funds should be able to wait the requisite time period before realizing their return. For an institutional investor, a private equity investment may represent only a small portion of its diversified investment portfolio.

Fees and expenses

When investing in a private equity fund, an investor usually receives offering documents detailing material information about the investment and enters into various agreements as a limited partner of the fund. These offering documents and agreements should disclose and govern the terms of the investor's investment throughout the fund's life, including the fees and expenses to be incurred by funds and their investors. The SEC has brought enforcement actions, for example here (https://www.sec.gov/litigation/admin/2015/ia-4219.pdf) , involving fees and expenses that were incurred by funds and their investors without being adequately consented to or disclosed. Investors should be vigilant (/additional-resources/news-alerts/alerts-bulletins/updated-investor-bulletin-how-fees-expenses-affect) about the fees and expenses incurred in connection with their investment.

In addition, advisers may be managing multiple funds that are jointly invested in multiple portfolio companies. The adviser has a legal obligation to act in the best interests of each of the funds it manages and must allocate expenses among itself, its funds and the funds' portfolio companies in accordance with this fiduciary duty. The SEC has brought several enforcement actions, for example here (https://www.sec.gov/litigation/admin/2015/ia-4131.pdf) , related to shifting and allocation of expenses.

Conflicts of interest

Private equity firms often have interests that are in conflict with the funds they manage and, by extension, the limited partners invested in the funds. Private equity firms may be managing multiple private equity funds as well as a number of portfolio companies. The funds typically pay the private equity firm for advisory services. In addition, the portfolio companies may also pay the private equity firm for services such as managing and monitoring the portfolio company. Affiliates of the private equity firm may also play a role as service providers to the funds or the portfolio companies. As fiduciaries, advisers must make full disclosure of all conflicts of interest between themselves and the funds they manage in order to get informed consent.

The SEC has brought several enforcement actions, for example here (https://www.sec.gov/litigation/admin/2015/ia-4253.pdf) , related to an adviser's alleged failure to disclose certain conflicts of interest to the funds it manages. Through its various relationships, including with affiliates and portfolio companies, there exists opportunity for advisers to benefit themselves at the expense of the funds they manage and their investors. It is important for an investor to be aware and alert about the conflicts that exist, or that may arise, in the course of an investment in a private equity fund.

2022 NAICS Definition

T = Canadian, Mexican, and United States industries are comparable.

518210 Computing Infrastructure Providers, Data Processing, Web Hosting, and Related Services

This industry comprises establishments primarily engaged in providing computing infrastructure, data processing services, Web hosting services (except software publishing), and related services, including streaming support services (except streaming distribution services). Data processing establishments provide complete processing and specialized reports from data supplied by clients or provide automated data processing and data entry services.

Illustrative Examples:

Application hosting
Cloud storage services
Computer data storage services

Computing platform infrastructure provision
Infrastructure as a service (IaaS)
Optical scanning services
Platform as a service (PaaS)
Video and audio technical streaming support services
Web hosting

Cross-References. Establishments primarily engaged in--

- Providing video and audio streaming distribution services--are classified in Industry 516210, Media Streaming Distribution Services, Social Networks, and Other Media Networks and Content Providers;
- Providing audiovisual postproduction services, including film/tape transfers and digitization (except digitization as a technical streaming support service)--are classified in U.S. Industry 512191, Teleproduction and Other Postproduction Services;
- Providing text processing and related document preparation activities--are classified in Industry 561410, Document Preparation Services;
- Software design, development, and publishing, or software publishing only--are classified in Industry 513210, Software Publishers;
- Developing custom software to meet the needs of a particular customer, without providing infrastructure or hosting services--are classified in U.S. Industry 541511, Custom Computer Programming Services;
- Providing computer hardware, software, and communication technologies integration services, with or without product sales--are classified in U.S. Industry 541512, Computer Systems Design Services;
- Selling computer hardware, packaged software, and communications equipment without providing systems integration services--are classified in Sector 42, Wholesale Trade, or Sector 44-45, Retail Trade;
- Providing on-site management and operation of a client's data processing facilities--are classified in U.S. Industry 541513, Computer Facilities Management Services;
- Providing wired broadband Internet access services using own operated telecommunications infrastructure, in combination with Web hosting--are classified in U.S. Industry 517111, Wired Telecommunications Carriers;
- Providing Internet access via client-supplied telecommunications connections in combination with Web hosting--are classified in Industry 517810, All Other Telecommunications;
- Operating Web search portals--are classified in Industry 519290, Web Search Portals and All Other Information Services;
- Providing access to computers and office equipment, as well as other office support services--are classified in Industry 56143, Business Service Centers;
- Processing financial transactions--are classified in Industry 522320, Financial Transactions Processing, Reserve, and Clearinghouse Activities; and
- Providing payroll processing services--are classified in U.S. Industry 541214, Payroll Services.

Estimating Burden

Burden hours and cost

One of the goals of the PRA is for the federal government to consider and account for the impact on the public when asking for information. This impact is called **burden**, and includes the value of both the time and the effort required to fulfill a collection along with the financial cost.

The PRA requires that agencies estimate burden to understand what is involved for the public to comply with a request.

Some common burden activities include:

- Reviewing instructions.
- Compiling materials necessary for collection.
- Acquiring, installing, and utilizing technology and systems.
- Adjusting existing ways to comply with previous instructions and requirements.

- Searching data sources.
- Completing and reviewing collected information.
- Compiling and sending information.

Overall, burden can seem intimidating, especially in a large collection. Our burden activity questions are a starting point to help you begin thinking about scope.

Avoiding excessive burden

Some examples of excessive burden include:

- Addressing more respondents than necessary.
- Asking questions that aren't relevant or essential.
  - You must justify questions about personally sensitive matters like religious beliefs or political affiliation, or questions that may cause persons to incriminate themselves.
- Asking for a reporting frequency that is higher than necessary.
- Not considering an alternative approach to obtain the information.
- Requesting information in a different format than is usually maintained.

If your collection involves activities seen as excessive, you must justify them in the *purpose* and *need* sections of the collection in your supporting statement.

I. INTRODUCTION

A. Chairs' Foreword

In June 2019, the Committee on the Judiciary initiated a bipartisan investigation into the state of competition online, spearheaded by the Subcommittee on Antitrust, Commercial and Administrative Law. As part of a top-to-bottom review of the market, the Subcommittee examined the dominance of Amazon, Apple, Facebook, and Google, and their business practices to determine how their power affects our economy and our democracy. Additionally, the Subcommittee performed a review of existing antitrust laws, competition policies, and current enforcement levels to assess whether they are adequate to address market power and anticompetitive conduct in digital markets.

Over the course of our investigation, we collected extensive evidence from these companies as well as from third parties—totaling nearly 1.3 million documents. We held seven hearings to review the effects of market power online—including on the free and diverse press, innovation, and privacy—and a final hearing to examine potential solutions to concerns identified during the investigation and to inform this Report's recommendations.

A year after initiating the investigation, we received testimony from the Chief Executive Officers of the investigated companies: Jeff Bezos, Tim Cook, Mark Zuckerberg, and Sundar Pichai. For nearly six hours, we pressed for answers about their business practices, including about evidence concerning the extent to which they have exploited, entrenched, and expanded their power over digital markets in anticompetitive and abusive ways. Their answers were often evasive and non-responsive, raising fresh questions about whether they believe they are beyond the reach of democratic oversight.

Although these four corporations differ in important ways, studying their business practices has revealed common problems. First, each platform now serves as a gatekeeper over a key channel of distribution. By controlling access to markets, these giants can pick winners and losers throughout our economy. They not only wield tremendous power, but they also abuse it by charging exorbitant fees, imposing oppressive contract terms, and extracting valuable data from the people and businesses that rely on them. Second, each platform uses its gatekeeper position to maintain its market power. By controlling the infrastructure of the digital age, they have surveilled other businesses to identify potential rivals, and have ultimately bought out, copied, or cut off their competitive threats. And, finally, these firms have abused their role as intermediaries to further entrench and expand their dominance. Whether through self-preferencing, predatory pricing, or exclusionary conduct, the dominant platforms have exploited their power in order to become even more dominant.

To put it simply, companies that once were scrappy, underdog startups that challenged the status quo have become the kinds of monopolies we last saw in the era of oil barons and railroad tycoons. Although these firms have delivered clear benefits to society, the dominance of Amazon, Apple, Facebook, and Google has come at a price. These firms typically run the marketplace while also competing in it—a position that enables them to write one set of rules for others, while they play by another, or to engage in a form of their own private *quasi* regulation that is unaccountable to anyone but themselves.

The effects of this significant and durable market power are costly. The Subcommittee's series of hearings produced significant evidence that these firms wield their dominance in ways that erode entrepreneurship, degrade Americans' privacy online, and undermine the vibrancy of the free and diverse press. The result is less innovation, fewer choices for consumers, and a weakened democracy.

Nearly a century ago, Supreme Court Justice Louis Brandeis wrote: "We must make our choice. We may have democracy, or we may have wealth concentrated in the hands of a few, but we cannot have both." Those words speak to us with great urgency today.

Although we do not expect that all of our Members will agree on every finding and recommendation identified in this Report, we firmly believe that the totality of the evidence produced during this investigation demonstrates the pressing need for legislative action and reform. These firms have too much power, and that power must be reined in and subject to appropriate oversight and enforcement. Our economy and democracy are at stake.

As a charter of economic liberty, the antitrust laws are the backbone of open and fair markets. When confronted by powerful monopolies over the past century—be it the railroad tycoons and oil barons or Ma Bell and Microsoft—Congress has acted to ensure that no dominant firm captures and holds undue control over our economy or our democracy. We face similar challenges today. Congress—not the courts, agencies, or private companies—enacted the antitrust laws, and Congress must lead the path forward to modernize them for the economy of today, as well as tomorrow. Our laws must be updated to ensure that our economy remains vibrant and open in the digital age.

Congress must also ensure that the antitrust agencies aggressively and fairly enforce the law. Over the course of the investigation, the Subcommittee uncovered evidence that the antitrust agencies failed, at key occasions, to stop monopolists from rolling up their competitors and failed to protect the American people from abuses of monopoly power. Forceful agency action is critical.

Lastly, Congress must revive its tradition of robust oversight over the antitrust laws and increased market concentration in our economy. In prior Congresses, the Subcommittee routinely examined these concerns in accordance with its constitutional mandate to conduct oversight and perform its legislative duties. As a 1950 report from the then-named Subcommittee on the Study of Monopoly Power described its mandate: "It is the province of this subcommittee to investigate factors which tend to eliminate competition, strengthen monopolies, injure small business, or promote undue concentration of economic power; to ascertain the facts, and to make recommendations based on those findings."[1]

Similarly, the Subcommittee has followed the facts before it to produce this Report, which is the product of a considerable evidentiary and oversight record. This record includes: 1,287,997 documents and communications; testimony from 38 witnesses; a hearing record that spans more than 1,800 pages; 38 submissions from 60 antitrust experts from across the political spectrum; and interviews with more than 240 market participants, former employees of the investigated platforms, and other individuals totaling thousands of hours. The Subcommittee has also held hearings and roundtables with industry and government witnesses, consultations with subject-matter experts, and a careful—and at times painstaking—review of large volumes of evidence provided by industry participants and regulators.

In light of these efforts, we extend our deep gratitude to the staff of the Subcommittee and Full Committee for their diligent work in this regard, particularly during the COVID-19 pandemic and other challenging circumstances over the past year.

Finally, as an institutional matter, we close by noting that the Committee's requests for information from agencies and any non-public briefings were solely for the purpose of carrying out our constitutionally based legislative and oversight functions. In particular, the information requested was vital to informing our assessment of whether existing antitrust laws are adequate for tackling current competition problems, as well as in uncovering potential reasons for under-enforcement. The Report by Subcommittee staff is based on the documents and information collected during its investigation, and the Committee fully respects the separate and independent decisional processes employed by enforcement authorities with respect to such matters.

Although the companies provided substantial information and numerous documents to the Subcommittee, they declined to produce certain critical information and crucial documents we requested. The material withheld was identified by the Committee as relevant to the investigation and included, primarily, two categories of information: (1) documents the companies' claimed were protected by common law privileges; and (2) documents that were produced to antitrust authorities in ongoing investigations, or that related to the subject matter of these ongoing investigations.

Institutionally, we reject any argument that the mere existence of ongoing litigation prevents or prohibits Congress from obtaining information relevant to its legislative and oversight prerogatives. We strongly disagree with the assertion that any requests for such materials and any compliance with those requests interfere with the decisional processes in ongoing investigations. Furthermore, while Congress is fully subject to constitutional protections, we cannot agree that we are bound by common

---

[1] H. REP. NO. 255, at 2 (1951) (Aluminum: Report of the Subcomm. On Study of Monopoly Power of the H. Comm. on the Judiciary).

law privileges as asserted by the companies. While we determined that insufficient time exists to pursue these additional materials during this Congress, the Committee expressly reserves the right to invoke other available options, including compulsory process, to obtain the requested information in the future.

The views and conclusions contained in the Report are staff views and do not necessarily reflect those of the Committee on the Judiciary or any of its Members.

B. Executive Summary

1. Subcommittee's Investigation

On June 3, 2019, the House Judiciary Committee announced a bipartisan investigation into competition in digital markets,[2] led by the Subcommittee on Antitrust, Commercial and Administrative Law.[3] The purpose of the investigation was to: (1) document competition problems in digital markets; (2) examine whether dominant firms are engaging in anticompetitive conduct; and (3) assess whether existing antitrust laws, competition policies, and current enforcement levels are adequate to address these issues.[4] The Committee initiated the investigation in response to broad-ranging investigative reporting, and activity by policymakers and enforcers, that raised serious concerns about the platforms' incentives and ability to harm the competitive process.[5]

[3] We extend our sincere thanks to Peter Karafotas, Rich Luchette, and Francis Grubar, in the Office of Congressman David N. Cicilline, for their relentless work and selfless devotion throughout the investigation. We would also like to recognize the following staff for their significant contributions during the investigation: Dick Meltzer, Michael Tecklenburg, Kenneth DeGraff, and Victoria Houed in the Office of the Speaker of the U.S. House of Representatives; Daniel Flores, former Minority Chief Counsel, Subcommittee on Antitrust, Commercial and Administrative Law; Danny Johnson, former Minority counsel, Committee on the Judiciary; Jacqui Kappler, Legislative Director, the Honorable Henry "Hank" Johnson, Jr.; Devon Ombres, Legislative Counsel, the Honorable Jamie Raskin; Elly Kugler, Senior Counsel, the Honorable Pramila Jayapal; Jennifer Chan, Legislative Director, the Honorable Pramila Jayapal; Stuart Styron, Senior Legislative Assistant, the Honorable Val Demings; Keanu Rivera, Legislative Assistant, the Honorable Mary Gay Scanlon; Lindsey Garber, Legislative Counsel, the Honorable Joe Neguse; Miya Patel, former Legislative Assistant, the Honorable Joe Neguse; and Natalie Knight, Legislative Counsel, the Honorable Lucy McBath. Staff would also like to thank Matthew Bisenius in the Office of F. James Sensenbrenner, as well as Garrett Ventry in the Office of Congressman Ken Buck, for their commitment to bipartisan cooperation. We also thank Hillary Marston, Legal Intern for the Committee on the Judiciary, for her assistance. Finally, we thank Clare Cho and Mari Lee at the Congressional Research Service for their support, as well as graphics and data visualization used within this Report.

As part of the investigation, the Subcommittee held seven oversight hearings that provided Members of the Subcommittee with an opportunity to examine the state of competition in digital markets and the adequacy of existing antitrust laws. A diverse group of witnesses offered testimony on topics related to the effects of market power on the free and diverse press, on innovation, and on privacy. Other witnesses who testified included executives from businesses with concerns about the dominance of the investigated firms. The hearings also provided an opportunity for key executives from Facebook, Google, Amazon, and Apple—including the Chief Executive Officers of these firms—to address evidence that was uncovered during the investigation in a public-facing venue. After each of the hearings, Members of the Subcommittee submitted questions for the record (QFRs) to the witnesses.

The Committee requested information from the dominant platforms, from market participants, from the Federal antitrust agencies, and from other relevant parties, for the purpose of obtaining information that was not otherwise publicly available but was important to assembling a comprehensive record. The Committee also sent requests for submissions to various experts in the field, including academics, representatives of public interest groups, and practicing antitrust lawyers. The responses to these requests were indispensable to staff's ability to complete this Report and its recommendations for congressional oversight of the antitrust agencies and legislative action.

This Report is intended to provide policymakers, antitrust enforcers, market participants, and the public with a comprehensive understanding of the state of competition in the online marketplace. The Report also provides recommendations for areas of legislative activity to address the rise and abuse of market power in the digital economy, as well as areas that warrant additional congressional attention.

2. Findings

a. Overview

The open internet has delivered significant benefits to Americans and the U.S. economy. Over the past few decades, it has created a surge of economic opportunity, capital investment, and pathways for education. The COVID-19 pandemic has underscored the importance of internet access that is affordable, competitive, and widely available for workers, families, and businesses.

The online platforms investigated by the Subcommittee—Amazon, Apple, Facebook, and Google—also play an important role in our economy and society as the underlying infrastructure for the exchange of communications, information, and goods and services. As of September 2020, the combined valuation of these platforms is more than $5 trillion—more than a third of the value of the S&P 100. As we continue to shift our work, commerce, and communications online, these firms stand to become even more interwoven into the fabric of our economy and our lives.

Over the past decade, the digital economy has become highly concentrated and prone to monopolization. Several markets investigated by the Subcommittee—such as social networking, general online search, and online advertising—are dominated by just one or two firms. The companies investigated by the Subcommittee—Amazon, Apple, Facebook, and Google—have captured control over key channels of distribution and have come to function as gatekeepers. Just a decade into the future, 30% of the world's gross economic output may lie with these firms, and just a handful of others.[6]

In interviews with Subcommittee staff, numerous businesses described how dominant platforms exploit their gatekeeper power to dictate terms and extract concessions that no one would reasonably consent to in a competitive market. Market participants that spoke with Subcommittee staff indicated that their dependence on these gatekeepers to access users and markets requires concessions and demands that carry significant economic harm, but that are "the cost of doing business" given the lack of options.

This significant and durable market power is due to several factors, including a high volume of acquisitions by the dominant platforms. Together, the firms investigated by the Subcommittee have acquired hundreds of companies just in the last ten years. In some cases, a dominant firm evidently acquired nascent or potential competitors to neutralize a competitive threat or to maintain and expand the firm's dominance. In other cases, a dominant firm acquired smaller companies to shut them down or discontinue underlying products entirely—transactions aptly described as "killer acquisitions."[7]

In the overwhelming number of cases, the antitrust agencies did not request additional information and documentary material under their pre-merger review authority in the Clayton Act to examine whether the proposed acquisition may substantially lessen competition or tend to create a monopoly if allowed to proceed as proposed. For example, of Facebook's nearly 100 acquisitions, the Federal Trade Commission engaged in an extensive investigation of just one acquisition: Facebook's purchase of Instagram in 2012.

During the investigation, Subcommittee staff found evidence of monopolization and monopoly power. For example, the strong network effects associated with Facebook has tipped the market toward

(Aug. 2, 2019), https://www.mckinsey.com/business-functions/marketing-and-sales/our-insights/prime-day-and-the-broad-reach-of-amazons-ecosystem ("This ecosystem strategy in particular has significant competitive implications because McKinsey estimates that in ten years, 30 percent of the world's gross economic output will be from companies that operate a network of interconnected businesses, such as those run by Amazon, Alibaba, Google, and Facebook.").

[7] Colleen Cunningham, Florian Ederer & Song Ma, *Killer Acquisitions*, 1 (Yale Sch. of Mgmt. Working Paper, Mar. 2019), https://perma.cc/L6YL-YL8K (describing the practice of "acquir[ing] innovative targets solely to discontinue the target's innovative projects and preempt future competition."). *See also* C. Scott Hemphill & Tim Wu, *Nascent Competitors*, 168 U. PA. L. REV. (forthcoming 2020) (manuscript at 2), https://perma.cc/62HH-34ZL ("A nascent competitor is a firm whose prospective innovation represents a serious future threat to an incumbent.").

monopoly such that Facebook competes more vigorously among its own products—Facebook, Instagram, WhatsApp, and Messenger—than with actual competitors.

As demonstrated during a series of hearings held by the Subcommittee and as detailed in this Report,[8] the online platforms' dominance carries significant costs. It has diminished consumer choice, eroded innovation and entrepreneurship in the U.S. economy, weakened the vibrancy of the free and diverse press, and undermined Americans' privacy.

These concerns are shared by the majority of Americans. On September 24, 2020, Consumer Reports (CR) published a survey titled "Platform Perceptions: Consumer Attitudes on Competition and Fairness in Online Platforms."[9] Among its findings:

- 85% of Americans are concerned—either very concerned or somewhat concerned—about the amount of data online platforms store about them, and 81% are concerned that platforms are collecting and holding this data in order to build out more comprehensive consumer profiles.

- 58% are not confident that they are getting objective and unbiased search results when using an online platform to shop or search for information.

- 79% say Big Tech mergers and acquisitions unfairly undermine competition and consumer choice.[10]

- 60% support more government regulation of online platforms, including mandatory interoperability features, to make it easier for users to switch from one platform to another without losing important data or connections.

b. <u>Facebook</u>

Facebook has monopoly power in the market for social networking. Internal communications among the company's Chief Executive Officer, Mark Zuckerberg, and other senior executives indicate that Facebook acquired its competitive threats to maintain and expand its dominance. For example, a senior executive at the company described its acquisition strategy as a "land grab" to "shore up" Facebook's position,[11] while Facebook's CEO said that Facebook "can likely always just buy any

competitive startups,"[12] and agreed with one of the company's senior engineers that Instagram was a threat to Facebook.[13]

Facebook's monopoly power is firmly entrenched and unlikely to be eroded by competitive pressure from new entrants or existing firms. In 2012, the company described its network effects as a "flywheel" in an internal presentation prepared for Facebook at the direction of its Chief Financial Officer.[14] This presentation also said that Facebook's network effects get "stronger every day."[15]

More recent documents produced during the investigation by Facebook show that it has tipped the social networking market toward a monopoly, and now considers competition within its own family of products to be more considerable than competition from any other firm. These documents include an October 2018 memorandum by Thomas Cunningham, a senior data scientist and economist at Facebook,[16] for Mr. Zuckerberg and Javier Olivan, Facebook's Director of Growth.[17] Among other things, the Cunningham Memo found that the network effects of Facebook and its family of products are "very strong,"[18] and that there are strong tipping points in the social networking market that create competition for the market, rather than competition within the market.[19]

According to a former senior employee at Instagram who was involved in the preparation of this document for review by Mr. Zuckerberg and Mr. Olivan, the Cunningham Memo guided Facebook's growth strategy, particularly with regard to Instagram.[20] They explained:

> The question was how do we position Facebook and Instagram to not compete with each other. The concern was the Instagram would hit a tipping point . . . There was brutal in-fighting between Instagram and Facebook at the time. It was very tense. It was back when Kevin Systrom was still at the company. He wanted Instagram to grow

> naturally and as widely as possible. But Mark was clearly saying "do not compete with us." . . . It was collusion, but within an internal monopoly. If you own two social media utilities, they should not be allowed to shore each other up. It's unclear to me why this should not be illegal. You can collude by acquiring a company.[21]

Facebook has also maintained its monopoly through a series of anticompetitive business practices. The company used its data advantage to create superior market intelligence to identify nascent competitive threats and then acquire, copy, or kill these firms. Once dominant, Facebook selectively enforced its platform policies based on whether it perceived other companies as competitive threats. In doing so, it advantaged its own services while weakening other firms.

In the absence of competition, Facebook's quality has deteriorated over time, resulting in worse privacy protections for its users and a dramatic rise in misinformation on its platform.

c. Google

Google has a monopoly in the markets for general online search and search advertising. Google's dominance is protected by high entry barriers, including its click-and-query data and the extensive default positions that Google has obtained across most of the world's devices and browsers. A significant number of entities—spanning major public corporations, small businesses, and entrepreneurs—depend on Google for traffic, and no alternate search engine serves as a substitute.

Google maintained its monopoly over general search through a series of anticompetitive tactics. These include an aggressive campaign to undermine vertical search providers, which Google viewed as a significant threat. Documents show that Google used its search monopoly to misappropriate content from third parties and to boost Google's own inferior vertical offerings, while imposing search penalties to demote third-party vertical providers. Since capturing a monopoly over general search, Google has steadily proliferated its search results page with ads and with Google's own content, while also blurring the distinction between paid ads and organic results. As a result of these tactics, Google appears to be siphoning off traffic from the rest of the web, while entities seeking to reach users must pay Google steadily increasing sums for ads. Numerous market participants analogized Google to a gatekeeper that is extorting users for access to its critical distribution channel, even as its search page shows users less relevant results.

A second way Google has maintained its monopoly over general search has been through a series of anticompetitive contracts. After purchasing the Android operating system in 2005, Google used contractual restrictions and exclusivity provisions to extend Google's search monopoly from desktop to mobile. Documents show that Google required smartphone manufacturers to pre-install and give default status to Google's own apps, impeding competitors in search as well as in other app

[21] Interview with Former Instagram Employee (Oct. 2, 2020).

markets. As search activity now migrates from mobile to voice, third-party interviews suggest Google is again looking for ways to maintain its monopoly over search access points through a similar set of practices.

Since capturing the market for online search, Google has extended into a variety of other lines of business. Today Google is ubiquitous across the digital economy, serving as the infrastructure for core products and services online. Through Chrome, Google now owns the world's most popular browser—a critical gateway to the internet that it has used to both protect and promote its other lines of business. Through Google Maps, Google now captures over 80% of the market for navigation mapping service—a key input over which Google consolidated control through an anticompetitive acquisition and which it now leverages to advance its position in search and advertising. And through Google Cloud, Google has another core platform in which it is now heavily investing through acquisitions, positioning itself to dominate the "Internet of Things," the next wave of surveillance technologies.

Internal communications also reveal that Google exploits information asymmetries and closely tracks real-time data across markets, which—given Google's scale—provide it with near-perfect market intelligence. In certain instances, Google has covertly set up programs to more closely track its potential and actual competitors, including through projects like Android Lockbox.

Each of its services provides Google with a trove of user data, reinforcing its dominance across markets and driving greater monetization through online ads. Through linking these services together, Google increasingly functions as an ecosystem of interlocking monopolies.

d. Amazon

Amazon has significant and durable market power in the U.S. online retail market. This conclusion is based on the significant record that Subcommittee staff collected and reviewed, including testimonials from third-party sellers, brand manufacturers, publishers, former employees, and other market participants, as well as Amazon's internal documents. Although Amazon is frequently described as controlling about 40% of U.S. online retail sales, this market share is likely understated, and estimates of about 50% or higher are more credible.

As the dominant marketplace in the United States for online shopping, Amazon's market power is at its height in its dealings with third-party sellers. The platform has monopoly power over many small- and medium-sized businesses that do not have a viable alternative to Amazon for reaching online consumers. Amazon has 2.3 million active third-party sellers on its marketplace worldwide, and a recent survey estimates that about 37% of them—about 850,000 sellers—rely on Amazon as their sole source of income.[22]

---

[22] JUNGLESCOUT, THE STATE OF THE AMAZON SELLER 2020 4 (2020), https://www.junglescout.com/wp-content/uploads/2020/02/State-of-the-Seller-Survey.pdf.

Amazon achieved its current dominant position, in part, through acquiring its competitors, including Diapers.com and Zappos. It has also acquired companies that operate in adjacent markets, adding customer data to its stockpile and further shoring up its competitive moats. This strategy has entrenched and expanded Amazon's market power in e-commerce, as well as in other markets. The company's control over and reach across its many business lines enable it to self-preference and disadvantage competitors in ways that undermine free and fair competition. As a result of Amazon's dominance, other businesses are frequently beholden to Amazon for their success.

Amazon has engaged in extensive anticompetitive conduct in its treatment of third-party sellers. Publicly, Amazon describes third-party sellers as "partners." But internal documents show that, behind closed doors, the company refers to them as "internal competitors." Amazon's dual role as an operator of its marketplace that hosts third-party sellers, and a seller in that same marketplace, creates an inherent conflict of interest. This conflict incentivizes Amazon to exploit its access to competing sellers' data and information, among other anticompetitive conduct.

Voice assistant ecosystems are an emerging market with a high propensity for lock-in and self-preferencing. Amazon has expanded Alexa's ecosystem quickly through acquisitions of complementary and competing technologies, and by selling its Alexa-enabled smart speakers at deep discounts. The company's early leadership in this market is leading to the collection of highly sensitive consumer data, which Amazon can use to promote its other business, including e-commerce and Prime Video.

Finally, Amazon Web Services (AWS) provides critical infrastructure for many businesses with which Amazon competes. This creates the potential for a conflict of interest where cloud customers are forced to consider patronizing a competitor, as opposed to selecting the best technology for their business.

e. Apple

Apple has significant and durable market power in the mobile operating system market. Apple's dominance in this market, where it controls the iOS mobile operating system that runs on Apple mobile devices, has enabled it to control all software distribution to iOS devices. As a result, Apple exerts monopoly power in the mobile app store market, controlling access to more than 100 million iPhones and iPads in the U.S.

Apple's mobile ecosystem has produced significant benefits to app developers and consumers. Launched in 2008, the App Store revolutionized software distribution on mobile devices, reducing barriers to entry for app developers and increasing the choices available to consumers. Despite this, Apple leverages its control of iOS and the App Store to create and enforce barriers to competition and discriminate against and exclude rivals while preferencing its own offerings. Apple also uses its power to exploit app developers through misappropriation of competitively sensitive information and to charge app developers supra-competitive prices within the App Store. Apple has maintained its dominance due to the presence of network effects, high barriers to entry, and high switching costs in the mobile operating system market.

Apple is primarily a hardware company that derives most of its revenue from sales of devices and accessories. However, as the market for products like the iPhone has matured, Apple has pivoted to rely increasingly on sales of its applications and services, as well as collecting commissions and fees in the App Store. In the absence of competition, Apple's monopoly power over software distribution to iOS devices has resulted in harm to competitors and competition, reducing quality and innovation among app developers, and increasing prices and reducing choices for consumers.

f. Effects of Market Power

The Subcommittee also examined the effects of market power in digital markets on the free and diverse press, innovation, privacy and data, and other relevant matters summarized below for ease of reference.

As part of this process, the Subcommittee received testimony and submissions showing that the dominance of some online platforms has contributed to the decline of trustworthy sources of news, which is essential to our democracy.[23] In several submissions, news publishers raised concerns about the "significant and growing asymmetry of power" between dominant platforms and news organizations, as well as the effect of this dominance on the production and availability of trustworthy sources of news. Other publishers said that they are "increasingly beholden" to these firms, and in particular, to Google and Facebook.[24] Google and Facebook have an outsized influence over the distribution and monetization of trustworthy sources of news online,[25] undermining the quality and availability of high-quality sources of journalism.[26] This concern is underscored by the COVID-19 pandemic, which has laid bare the importance of preserving a vibrant free press in both local and national markets.

[23] *Online Platforms and Market Power, Part 1: The Free and Diverse Press: Hearing Before the Subcomm. on Antitrust, Commercial and Admin. Law of the H. Comm. on the Judiciary*, 116th Cong. 1–3 (2019) [hereinafter Free and Diverse Press Hearing] (statement of David Pitofsky, Gen. Counsel, News Corp).

[24] Submission from Source 53 to H. Comm. on the Judiciary, 7 (Oct. 14, 2019) (on file with Comm.) Although Apple News and Apple News Plus are increasingly popular news aggregators, most market participants that the Subcommittee received evidence from during the investigation do not view it as a critical intermediary for online news at this time. Some publishers raised competition concerns about the tying of payment inside Apple's news product. Others, however, did raise concern about Apple News and Apple News Plus, noting that it is "not creating any original journalism itself" and competes "against publishers' news products . . . for subscription revenues." *Id.* at 6.

[25] Submission of Source 52 to H. Comm. on the Judiciary, 12 (Oct. 30, 2019) (on file with Comm.).

[26] Free and Diverse Press Hearing at 3 (statement of David Chavern, Pres. & CEO, News Media Alliance) ("In effect, a couple of dominant tech platforms are acting as regulators of the digital news industry.").

The rise of market power online has also materially weakened innovation and entrepreneurship in the U.S. economy.[27] Some venture capitalists, for example, report that there is an innovation "kill zone" that insulates dominant platforms from competitive pressure simply because investors do not view new entrants as worthwhile investments.[28] Other investors have said that they avoid funding entrepreneurs and other companies that compete directly or indirectly with dominant firms in the digital economy.[29] In an interview with Subcommittee staff, a prominent venture capital investor explained that due to these factors, there is a strong economic incentive for other firms to avoid head-on competition with dominant firms.[30]

Additionally, in the absence of adequate privacy guardrails in the United States, the persistent collection and misuse of consumer data is an indicator of market power online.[31] Online platforms rarely charge consumers a monetary price—products appear to be "free" but are monetized through people's attention or with their data.[32] In the absence of genuine competitive threats, dominant firms offer fewer privacy protections than they otherwise would, and the quality of these services has deteriorated over time. As a result, consumers are forced to either use a service with poor privacy safeguards or forego the service altogether.[33]

Finally, the market power of the dominant platforms risks undermining both political and economic liberties. Subcommittee staff encountered a prevalence of fear among market participants

that depend on the dominant platforms, many of whom expressed unease that the success of their business and their economic livelihood depend on what they viewed as the platforms' unaccountable and arbitrary power. Additionally, courts and enforcers have found the dominant platforms to engage in recidivism, repeatedly violating laws and court orders. This pattern of behavior raises questions about whether these firms view themselves as above the law, or whether they simply treat lawbreaking as a cost of business. Lastly, the growth in the platforms' market power has coincided with an increase in their influence over the policymaking process. Through a combination of direct lobbying and funding think tanks and academics, the dominant platforms have expanded their sphere of influence, further shaping how they are governed and regulated.

3. Recommendations

As part of the investigation of competition in digital markets, the Subcommittee conducted a thorough examination of the adequacy of current laws and enforcement levels. This included receiving submissions from experts on antitrust and competition policy who were selected on a careful, bipartisan basis to ensure the representation of a diverse range of views on these matters. The Subcommittee also received other submissions from leading experts—including Executive Vice President Margrethe Vestager of the European Commission and Chair Rod Sims of the Australian Competition and Consumer Commission—to inform this inquiry. Most recently, on October 1, 2020, the Subcommittee held an oversight hearing on "Proposals to Strengthen the Antitrust Laws and Restore Competition Online" to examine potential solutions to concerns identified during the investigation to further inform the Report's recommendations.

Based on this oversight activity, Subcommittee Chairman Cicilline requested that staff provide a menu of reforms to Members of the Subcommittee for purposes of potential legislative activity during the remainder of the 116th Congress and thereafter. As he noted in remarks to the American Antitrust Institute in June 2019:

> [I]t is Congress' responsibility to conduct oversight of our antitrust laws and competition system to ensure that they are properly working and to enact changes when they are not. While I do not have any preconceived ideas about what the right answer is, as Chairman of the Antitrust Subcommittee, I intend to carry out that responsibility with the sense of urgency and serious deliberation that it demands.[34]

In response to this request, Subcommittee staff identified a broad set of reforms for further examination by the Members of the Subcommittee for purposes of crafting legislative responses to the findings of this Report. These reforms include proposals to: (1) address anticompetitive conduct in

---

[34] Hon. David N. Cicilline, Chairman, Subcomm. on Antitrust, Commercial and Admin. Law of the H. Comm. on the Judiciary, Keynote Address at American Antitrust Institute's 20th Annual Policy Conference (June 20, 2019), https://cicilline.house.gov/press-release/cicilline-delivers-keynote-address-american-antitrust-institute%E2%80%99s-20th-annual-policy.

digital markets; (2) strengthen merger and monopolization enforcement; and (3) improve the sound administration of the antitrust laws through other reforms. We intend these recommendations to serve as a complement to vigorous antitrust enforcement. Consistent with the views expressed by Chairman Nadler and Subcommittee Chairman Cicilline in the Foreword to this Report, we view these recommendations as complements, and not substitutes, to forceful antitrust enforcement.

For ease of reference, these recommendations for further examination are summarized below.

a. Restoring Competition in the Digital Economy

- Structural separations and prohibitions of certain dominant platforms from operating in adjacent lines of business;

- Nondiscrimination requirements, prohibiting dominant platforms from engaging in self-preferencing, and requiring them to offer equal terms for equal products and services;

- Interoperability and data portability, requiring dominant platforms to make their services compatible with various networks and to make content and information easily portable between them;

- Presumptive prohibition against future mergers and acquisitions by the dominant platforms;

- Safe harbor for news publishers in order to safeguard a free and diverse press; and

- Prohibitions on abuses of superior bargaining power, proscribing dominant platforms from engaging in contracting practices that derive from their dominant market position, and requirement of due process protections for individuals and businesses dependent on the dominant platforms.

b. Strengthening the Antitrust Laws

- Reasserting the anti-monopoly goals of the antitrust laws and their centrality to ensuring a healthy and vibrant democracy;

- Strengthening Section 7 of the Clayton Act, including through restoring presumptions and bright-line rules, restoring the incipiency standard and protecting nascent competitors, and strengthening the law on vertical mergers;

- Strengthening Section 2 of the Sherman Act, including by introducing a prohibition on abuse of dominance and clarifying prohibitions on monopoly leveraging, predatory pricing, denial of essential facilities, refusals to deal, tying, and anticompetitive self-preferencing and product design; and

- Taking additional measures to strengthen overall enforcement, including through overriding problematic precedents in the case law.

c. Reviving Antitrust Enforcement

- Restoring robust congressional oversight of the antitrust laws and their enforcement;

- Restoring the federal antitrust agencies to full strength, by triggering civil penalties and other relief for "unfair methods of competition" rules, requiring the Federal Trade Commission to engage in regular data collection on concentration, enhancing public transparency and accountability of the agencies, requiring regular merger retrospectives, codifying stricter prohibitions on the revolving door, and increasing the budgets of the FTC and the Antitrust Division; and

- Strengthening private enforcement through elimination of obstacles such as forced arbitration clauses, limits on class action formation, judicially created standards constraining what constitutes an antitrust injury, and unduly high pleading standards.

II. THE INVESTIGATION OF COMPETITION IN DIGITAL MARKETS

A. Requests for Information and Submissions

1. First-Party Requests for Information

On September 13, 2019, the Committee sent bipartisan requests for information (RFIs) to each of the four investigated platforms: Alphabet,[35] Amazon, Apple, and Facebook. For each company, the RFI asked for a comprehensive set of information about each of the company's products and services. In addition, the RFI asked the company to submit communications among high-level executives relating to various potentially anticompetitive acquisitions and conduct. The Committee requested that the platforms respond to the RFIs by October 14, 2019.

[35] In 2015, Google reorganized under a new name and parent company, Alphabet, separated various businesses, and placed Sundar Pichai as chief executive of Google. Larry Page, chief executive of Google, became head of Alphabet with Sergey Brin. *See* Conor Dougherty, *Google to Reorganize as Alphabet to Keep Its Lead as an Innovator*, N.Y. TIMES (Aug. 10, 2015), https://www.nytimes.com/2015/08/11/technology/google-alphabet-restructuring.html.

a. Alphabet

The Committee's RFI to Alphabet, the parent company of Google, asked for information necessary to understand how the company operates and its role in the digital marketplace.[36] For example, in Request A, the RFI asked for detailed financial statements and a description of Alphabet's relevant products and services, including Google Ads, Google Search, YouTube, and Waze. In addition, the RFI asked for information helpful for determining whether Alphabet has monopoly power for any of its products or services, including for each product or service: (i) a list of Alphabet's top ten competitors; and (ii) internal or external analyses of Alphabet's market share relative to its competitors. Request A also asked for copies of documents and information that Alphabet had submitted to any U.S. or international antitrust enforcement agency for antitrust investigations that took place in any of those agencies within the past decade.[37]

Request B asked for all communications from high-level executives, including former CEO Larry Page and current CEO Sundar Pichai, relating to a number of Alphabet's key acquisitions and potentially anticompetitive conduct, most of which have been widely reported in the news.[38] The RFI asked for communications, including, but not limited to, discussions relating to the deal rationale and any competitive threat posed by the acquired company for the following acquisitions: Google/Android in 2005, Google/YouTube in 2006, Google/DoubleClick in 2007, Google/AdMob in 2009, and Google's acquisition of a minority stake in Vevo in 2013. Request B of the Alphabet RFI also requested executive communications relating to certain categories of potential anticompetitive conduct.[39]

In response to this request, Alphabet produced 1,135,398 documents, including strategy memoranda, presentations, and materials produced in prior investigations. Although Google produced a significant amount of material, Subcommittee staff did not view this volume as a proxy for quality.

b. Amazon

The Committee's RFI to Amazon asked for similar types of information helpful for understanding the competitive dynamics of the digital marketplace and the company's role.[40] For example, in Request A, the RFI asked for detailed financial statements and a description of Amazon's relevant products and services, including Alexa, Amazon Marketplace, Amazon Prime, and Amazon Web Services (AWS). In addition, the RFI asked for information helpful for determining whether Amazon has monopoly power for any of its products or services, including for each product or service: (i) a list of Amazon's top ten competitors; and (ii) internal or external analyses of Amazon's market share relative to its competitors. Request A also asked for copies of documents and information that Amazon had submitted to any U.S. or international antitrust enforcement agency for antitrust investigations that took place in any of those agencies within the past decade.[41]

Request B asked for all communications from high-level executives, including CEO Jeff Bezos and Jay Carney, Senior Vice President for Global Corporate Affairs, relating to a number of Amazon's key acquisitions and potentially anticompetitive conduct, most of which have been widely reported in the news.[42] The RFI asked for communications, including, but not limited to, discussions relating to the deal rationale and any competitive threat posed by the acquired company for the following acquisitions: Amazon/Audible in 2008, Amazon/Zappos in 2009, Amazon/Quidsi (Diapers.com) in 2010[43], Amazon/Whole Foods in 2017, and Amazon/Ring in 2018. Request B of the Amazon RFI also requested executive communications relating to certain categories of potential anticompetitive conduct.[44]

In response to the Committee's requests, Amazon produced 24,299 documents, including internal emails among the company's senior executives, memoranda, presentations, and other materials.

c. Apple

The Committee's RFI to Apple also asked for information helpful for understanding the company's role in the digital marketplace. For example, in Request A, the RFI asked for detailed financial statements and a description of Apple's relevant products and services, including the iPhone, App Store, and Apple Pay.[45] In addition, the RFI asked for information helpful for determining whether Apple has monopoly power for any of its products or services, including for each product or service: (i) a list of Apple's top ten competitors; and (ii) internal or external analyses of Apple's market share relative to its competitors. Request A also asked for copies of documents and information that Apple had submitted to any U.S. or international antitrust enforcement agency for antitrust investigations that took place in any of those agencies within the past decade.[46]

Request B asked for all communications from high-level executives, including CEO Tim Cook and Eddy Cue, Senior Vice President of Internet Software and Services, relating to potentially anticompetitive conduct, most of which has been widely reported in the news.[47] The RFI asked for communications, including, but not limited to, discussions relating to certain categories of potentially anticompetitive conduct.[48]

In response to the Committee's requests, Apple produced 2,246 documents. These documents include internal communications among the company's senior executives describing governance of the App Store, as well as the company's internal deliberations and strategy responding to recent controversies.

d. Facebook

The Committee's RFI to Facebook also asked for information helpful for understanding how the company operates and its role in the digital marketplace.[49] For example, in Request A, the RFI

asked for detailed financial statements and a description of Facebook's relevant products and services, including Facebook, Instagram, and WhatsApp. In addition, the RFI asked for information helpful for determining whether Facebook has monopoly power for any of its products or services, including for each product or service: (i) a list of Facebook's top ten competitors; and (ii) internal or external analyses of Facebook's market share relative to its competitors. Request A also asked for copies of documents and information that Facebook had submitted to any U.S. or international antitrust enforcement agency for antitrust investigations that took place in any of those agencies within the past decade.[50]

Request B asked for all communications from high-level executives, including Founder and CEO Mark Zuckerberg and Sheryl Sandberg, Chief Operating Officer, relating to a number of Facebook's key acquisitions and potentially anticompetitive conduct, most of which have been widely reported in the news.[51] The RFI asked for communications, including, but not limited to, discussions relating to the deal rationale and any competitive threat posed by the acquired company for the following acquisitions: Facebook/Instagram in 2012, Facebook/Onavo in 2013, and Facebook/WhatsApp in 2014. Request B of the Facebook RFI also requested executive communications relating to certain categories of potentially anticompetitive conduct.[52]

In response to the Committee's requests, Facebook produced 41,442 documents, including documents produced in response to prior investigations into Facebook's acquisitions and into whether it had abused its dominance. Facebook also produced 83,804 documents in connection with litigation in an ongoing matter. Among other items, these documents include internal communications among the company's senior executives describing Facebook's acquisition and overall competition strategy. In response to supplemental requests by Subcommittee staff, Facebook produced internal market data over a multi-year period, as well as a memorandum prepared by a senior data scientist and economist at the company related to competition among Facebook's family of products and other social apps.

2. Process for Obtaining Responses to First-Party Requests

After sending the RFIs, Subcommittee staff invested considerable time and resources in making themselves available for calls with the platforms to answer any questions the platforms had about responding to the requests, on a nearly weekly basis from October 2019 through March 2020. On these calls, staff addressed a range of issues, including clarifying the meaning and intent of language in the

[52] *See id.* at 2–5.

request; maintaining the confidentiality of sensitive business information; and, where appropriate, narrowing requests in an effort to balance the Committee's need for relevant information against the platforms' burden of production. Each of the investigated platforms failed to meet the October 14, 2019 deadline, citing various difficulties.

On December 4, 2019, nearly three months after the deadline for submitting the RFI responses, the Committee sent a letter to the platforms' CEOs pointing out their failure to comply. The Committee stated its expectation that the platforms would complete production by December 18, 2019 for Request A and January 2, 2020 for Request B, to avoid the need to invoke other processes and procedures to obtain the requested materials.[53]

After the platforms failed to meet the revised deadlines, in early February 2020, staff asked for the companies' outside counsel to attend in-person meetings to discuss the substantial gaps in production that remained, and to identify ways to address any obstacles the platforms identified to filling those gaps. Despite the Committee's best efforts to address those obstacles—and allowing substantial time for the platforms to navigate delays relating to the COVID-19 pandemic—staff again had to reach out to the platforms regarding the deficiency of their responses. On June 9, 2020, in a final effort to avoid resorting to issuing subpoenas to the platforms to compel the production of documents and information, staff requested that the platforms voluntarily provide information responsive to a reduced list of targeted requests by June 22, 2020.

3. Third-party Requests for Information

As part of the investigation, the Subcommittee collected a large amount of information from market participants, including customers and competitors of Amazon, Apple, Facebook, and Google. Staff also received information and analysis from other third parties, including academics, former antitrust government officials, public interest organizations, and trade associations.

a. Market Participants

In September, the Committee sent a request for information to over 80 market participants. The RFI asked the recipient to voluntarily provide information regarding the state of competition in the digital marketplace for various products and services, including number and identity of market participants, market shares, and barriers to entry. These third-party RFIs also asked for a description of any conduct by Amazon, Apple, Facebook, or Google that raises competition concerns, and the impact of such conduct on the recipient's business. The Committee also sought to gather information through

[53] *See e.g.*, Letter from Hon. Jerrold Nadler, Chairman, H. Comm. on the Judiciary, Hon. Doug Collins, Ranking Member, H. Comm on the Judiciary, Hon. David N. Cicilline, Chairman, Subcomm. on Antitrust, Commercial and Admin. Law of the H. Comm. on the Judiciary & Hon. F. James Sensenbrenner, Ranking Member, Subcomm. on Antitrust, Commercial and Admin. Law of the H. Comm. on the Judiciary to Mark Zuckerberg, CEO, Facebook, Inc. (Dec. 4, 2019) (on file with Comm.).

these RFIs regarding broader questions based on the recipient's experience in the digital marketplace, including (i) whether market participants are able to compete on the merits of their goods and services; (ii) the adequacy of antitrust enforcement relating to merger review and anticompetitive conduct; (iii) the adequacy of current antitrust law to address anticompetitive mergers and anticompetitive conduct; and (iv) suggestions for improving enforcement of antitrust law and making changes to antitrust law itself, statutory or otherwise.

On January 7, 2020, the Committee sent a second round of RFIs to 29 market participants. These RFI recipients consisted of additional businesses and individuals that staff had identified during the first half of the investigation as likely to have relevant information and an interest in sharing that information with the Committee. These RFIs asked for similar information to the September RFIs and provided staff with additional valuable information and insights into the functioning and challenges of operating in the digital marketplace.

Unfortunately, some market participants did not respond to substantive inquiries due to fear of economic retaliation. These market participants explained that their business and livelihoods rely on one or more of the digital platforms. One response stated, "Unfortunately, [the CEO] is not able to be more public at this time out of concern for retribution to his business," adding, "I am pretty certain we are not the only ones that are afraid of going public."[54] Another business that ultimately declined to participate in the investigation expressed similar concerns, stating, "We really appreciate you reaching out to us and are certainly considering going on the record with our story. . . . Given how powerful Google is and their past actions, we are also quite frankly worried about retaliation."[55] Stacy Mitchell, Co-Director of the Institute for Local Self-Reliance, similarly testified that many businesses have a fear of speaking out about Amazon, stating, "I spend a lot of time interviewing and talking with independent retailers, manufacturers of all sizes. Many of them are very much afraid of speaking out publicly because they fear retaliation."[56]

b. <u>Antitrust Experts</u>

The Committee's final round of outreach to third parties involved sending letters on March 13, 2020, soliciting insights and analysis from several dozen antitrust experts who were identified on a bipartisan basis and whose submissions represent a diverse range of experience and perspectives. In support of the investigation's objective to assess the adequacy of existing antitrust laws, competition

policies, and current enforcement levels, the Committee invited submissions on three main topics. The first topic covered the adequacy of existing laws—case law and statutes—that prohibit monopolization and monopolistic conduct. The second topic similarly dealt with the adequacy of existing law, but focused on its sufficiency to address anticompetitive mergers and acquisitions, including vertical and conglomerate mergers, serial acquisitions, data acquisitions, and strategic acquisitions of potential competitors. Third, the Committee sought feedback on whether the institutional structure of antitrust enforcement is adequate to promote the robust enforcement of the antitrust laws, including current levels of appropriations to the antitrust agencies, existing agency authorities, and congressional oversight of enforcement.

c. Additional Outreach and Submissions

In addition to sending the RFIs in September and January, Subcommittee staff engaged in extensive outreach to additional third parties based on public reports and non-public information gathered throughout the investigation, suggesting that such entities had relevant information.

Subcommittee staff also received submissions from numerous individuals and businesses throughout the course of the investigation. These submissions came from a wide range of sources and in a variety of forms. For example, an anonymous source sent thumb drives to the Committee's main office in the Rayburn House Office Building. Other examples included former or current employees submitting tips to the Subcommittee's investigation email address, or through the form for anonymous submissions posted on the Subcommittee's investigation website.

4. Antitrust Agencies Requests for Information

As part of the Committee's September 2019 efforts to gather information, the Committee also sent requests for information to the Federal Trade Commission and the Department of Justice. In part, the Committee sought this information to carry out its function as the principal oversight authority for the Department of Justice, including its component agencies, its personnel, and its law enforcement activities.[57] Similarly, the Committee's jurisdiction extends to the FTC's antitrust-related work, and to administrative practice and procedure, including at the FTC.[58] The Committee's RFIs requested documents relating to the agencies' decisions to open or close investigations into potential violations of antitrust law in digital markets, decisions to challenge mergers or conduct in federal district court or in administrative action, and decisions to forego litigation in favor of a settlement agreement.[59] Senior

AR_003319

officials from the FTC and the Antitrust Division also provided several briefings to Members of the Subcommittee and staff in response to the requests of the Subcommittee Chairman and Ranking Member. These briefings served as an opportunity for Members to obtain information and updates about the current state of antitrust law and enforcement in digital markets.

B. Hearings

On June 11, 2019, the Subcommittee held part one of its series of investigation hearings titled "Online Platforms and Market Power, Part 1: The Free and Diverse Press." At this hearing, the Subcommittee heard testimony from the following Majority witnesses: David Chavern, President of the News Media Alliance; Gene Kimmelman, President and CEO of Public Knowledge; Sally Hubbard, Director of Enforcement Strategy at Open Markets Institute (OMI); and Matthew Schruers, Vice President for Law and Policy at Computer and Communications Industry Association (CCIA). The Minority witnesses were David Pitofsky, General Counsel for News Corp; and Kevin Riley, Editor of the *Atlanta-Journal Constitution*.[60]

On July 16, 2019, the Subcommittee held its second hearing, a two-paneled hearing titled "Online Platforms and Market Power, Part 2: Innovation and Entrepreneurship." On the first panel, the Subcommittee heard testimony from the following: Adam Cohen, Director of Economic Policy at Google; Nate Sutton, Associate General Counsel, Competition, at Amazon; Matt Perault, Head of Global Policy Development at Facebook; and Kyle Andeer, Vice President and Corporate Law and Chief Compliance Officer at Apple. On the second panel, the Subcommittee heard testimony from the following Majority witnesses: Timothy Wu, Julius Silver Professor of Law, Science and Technology at Columbia Law School; Fiona Scott Morton, Theodore Nierenberg Professor of Economics at Yale University School of Management; and Stacy Mitchell, Co-Director of the Institute for Local Self-Reliance. On the second panel, the Minority witnesses were Maureen Ohlhausen, Partner at Baker Botts and former Commissioner and Acting Chairwoman of the Federal Trade Commission; Morgan Reed, Executive Director of The App Association; and Carl Szabo, Vice President and General Counsel at NetChoice.[61]

On October 18, 2019, the Subcommittee held its third hearing titled "Online Platforms and Market Power, Part 3: The Role of Data and Privacy in Competition." At this hearing, the Subcommittee heard testimony from the following Majority witnesses: the Honorable Rohit Chopra, Commissioner at the Federal Trade Commission; Dr. Jason Furman, Professor of the Practice of Economic Policy at Harvard Kennedy School and former Chairman of the Council of Economic Advisers (CEA); and Dr. Tommaso Valletti, Professor of Economics and Head of the Department of

Economics & Public Policy at Imperial College Business School and former Chief Competition Economist of the European Commission's Directorate General for Competition (DG-Comp). The Minority witness at the hearing was Dr. Roslyn Layton, Visiting Scholar at the American Enterprise Institute.[62]

On November 13, 2019, the Subcommittee held its fourth hearing titled "Online Platforms and Market Power, Part 4: Perspectives of the Antitrust Agencies." At this hearing, the Subcommittee heard testimony from the following witnesses: the Honorable Makan Delrahim, Assistant Attorney General for the Antitrust Division at the Department of Justice; and the Honorable Joseph J. Simons, Chairman of the Federal Trade Commission.[63]

On January 17, 2020, the Subcommittee held its fifth hearing titled "Field Hearing: Online Platforms and Market Power, Part 5: Competitors in the Digital Economy." At this hearing, which took place in the congressional district of Subcommittee Vice Chairman Joe Neguse (D-CO) at the University of Colorado School of Law, the Subcommittee heard testimony from the following Majority witnesses: Patrick Spence, Chief Executive Officer of Sonos; David Barnett, Founder and Chief Executive Officer of PopSockets; and Kirsten Daru, Vice President and General Counsel at Tile. The Minority witness at the hearing was David Heinemeier Hansson, Cofounder and Chief Technology Officer of Basecamp.[64]

On July 29, 2020, the Subcommittee held its sixth hearing titled "Online Platforms and Market Power, Part 6: Examining the Dominance of Amazon, Apple, Facebook, and Google." At this hearing, the Subcommittee heard testimony from the following witnesses: Jeff Bezos, Chief Executive Officer at Amazon; Sundar Pichai, Chief Executive Officer at Alphabet and Google; Tim Cook, Chief Executive Officer at Apple; and Mark Zuckerberg, Chief Executive Officer at Facebook.[65]

On October 1, 2020, the Subcommittee held its seventh hearing titled "Proposals to Strengthen the Antitrust Laws and Restore Competition Online." The Majority witnesses at the hearing included: William Baer, Visiting Fellow, Brookings Institution, and former Associate Attorney General, Department of Justice; Zephyr Teachout, Associate Professor of Law, Fordham University School of Law; Michael Kades, Director of Markets and Competition Policy, Washington Center for Equitable

Growth; Sabeel Rahman, Associate Professor of Law, Brooklyn Law School and President, Demos; and Sally Hubbard, Director of Enforcement Strategy, Open Markets Institute. The Minority witnesses at the hearing were Christopher Yoo, John H. Chestnut Professor of Law, Communication, and Information Science, University of Pennsylvania Carey Law School; and Rachel Bovard, Senior Director of Policy, Conservative Partnership Institute; and Tad Lipsky, Antonin Scalia Law School, George Mason University.[66]

C. Roundtables

In addition to holding public hearings, the Subcommittee also held a series of bipartisan roundtables for Members of the Subcommittee and staff to provide Members with an opportunity to conduct further oversight of: (1) the state of competition and problems in digital markets; (2) whether dominant firms have engaged in anticompetitive conduct; and (3) if antitrust laws, competition policies, and current enforcement levels are adequate to address these issues. In total, the Subcommittee held twelve briefings and roundtables in Washington, D.C.; four roundtables in Boulder, Colorado; and a virtual roundtable with stakeholders from Rhode Island and elsewhere in New England.[67]

The Subcommittee hosted multiple briefings and roundtables with experts on the digital economy on a range of topics. Experts included state antitrust enforcers, former officials from the Antitrust Division of the Department of Justice and the Federal Trade Commission, former technology industry executives, small business owners, representatives from the news industry, entrepreneurs, antitrust scholars, representatives from civil society, and representatives from libraries.

The briefings and roundtables covered a broad array of topics related to competition in the digital marketplace. These topics included:

- The effect that small algorithm changes by dominant platforms can have on small businesses that rely on the platform;

- The data advantages that dominant online platform companies have over smaller competitors and startups, and how those data advantages can reinforce dominance and serve as a barrier to entry;

---

[66] *Online Platforms and Market Power, Part 7: Proposals to Strengthen the Antitrust Laws and Restore Competition Online: Hearing Before the Subcomm. on Antitrust, Commercial and Admin. Law of the H. Comm. on the Judiciary*, 116th Cong. (2020) [hereinafter Remedies Hearing], https://judiciary.house.gov/calendar/eventsingle.aspx?EventID=3367.

[67] This roundtable was originally scheduled to take place physically as a field hearing in Providence, Rhode Island, but was held virtually due to the COVID-19 pandemic.

- The effect of dominant online platform company power and practices on a free and diverse press and the local newsgathering and reporting;

- The impact of dominant online platform company power and practices on investment in startups by venture capital firms;

- The fear of economic retaliation by dominant platforms against smaller companies that raise concerns about anticompetitive conduct in the digital marketplace;

- Other features of digital markets—including, but not limited to, network effects, economies of scale and scope, and barriers to entry—that make them prone to high concentration and monopolization;

- Enforcement of the antitrust laws; and

- Modernization of antitrust statutes and competition policy.

Additionally, the Subcommittee held briefings also allowed representatives from Google, Amazon, Facebook, and Apple to make their own presentations to Subcommittee staff and to answer questions and provide details regarding their companies' business practices, structures, and strategies in the marketplace.

D. Prior Investigations

The Subcommittee's current review of competition in the digital marketplace continues a long oversight tradition. Over many decades, the House Judiciary Committee and its antitrust subcommittee have conducted careful, fact-based inquiries into industrial sectors showing signs of undue concentration and anticompetitive conduct. As a 1951 report from the then-named Subcommittee on the Study of Monopoly Power described its mandate, "It is the province of this subcommittee to investigate factors which tend to eliminate competition, strengthen monopolies, injure small business, or promote undue concentration of economic power; to ascertain the facts, and to make recommendations based on those findings."[68]

The Subcommittee followed the same process "to ascertain the facts" in this investigation. It has included hearings with industry and government witnesses, consultations with subject-matter experts, and a careful—and at times painstaking—review of large volumes of evidence provided by industry participants and regulators. Recognizing that antitrust investigations are by their nature fact-

[68] H. REP. NO. 255, at 2 (1951) (Aluminum: Report of the Subcomm. On Study of Monopoly Power of the H. Comm. on the Judiciary).

dependent, teams of investigators invested significant resources to study the structure of the relevant markets and the important firms in those markets.[69]

The purpose of these exercises was not to supersede the activities of antitrust enforcers such as the Federal Trade Commission (FTC) and the Department of Justice (DOJ), but to compile the Committee's own record about current market conditions; to assess how antitrust laws and principles are being applied in the current business environment; and to determine whether revised laws, or new laws, or better enforcement are needed to protect competition.

While the Committee's investigations were not intended to interfere with the enforcement activities of antitrust enforcers or regulators, they often conducted inquiries into the same sectors and issues that DOJ, the FTC, the Federal Communications Commission (FCC), and other agencies with authority over competition policy or enforcement were also examining. As Members and staff of the Committee charged with the "protection of trade and commerce against unlawful restraints and monopolies,"[70] these investigators exercised their legislative authority to probe any aspect of antitrust that they deemed warranted attention.

These investigations were guided by the principle that "[h]istory has proven that the most conducive environment for innovation and new product availability is a competitive market,"[71] and that a "free competitive economy" is an important American value.[72] It was a value that had been formally embedded in our economy and society by the Sherman Act of 1890, "the peculiarly American charter of economic freedom."[73] In a 1958 report on the airline industry, the then-named Antitrust Subcommittee explained that Americans' social and political freedoms depended on "opportunity for market access and market rivalries in a private-enterprise economy."[74] The "freedom of entry into any industry or field of endeavor," a 1962 Subcommittee report explained, is a cornerstone of U.S. antitrust policy that has "encouraged extensive individual proprietorship . . . and has made our free enterprise system great and strong."[75] A 1992 Committee report recommended restrictions on the monopolistic

Regional Bell Operating Companies (RBOCs) "[f]or the sake of the democratic economic and political values which depend on the preservation of free markets."[76]

In some cases, antitrust investigations exposed antitrust problems that the Committee concluded required attention from regulators. For example, a 1958 Antitrust Subcommittee report on the rapidly growing domestic airline industry exposed the behind-the-scenes anticompetitive campaign that incumbent air carriers and their advocacy group, the Air Transport Association of America (ATA), had been waging to prevent the Civil Aeronautics Board (CAB) from approving market entry by new air carriers (known at the time as "nonskeds").[77] The Committee found the conduct of the ATA so egregious that it recommended an investigation by the DOJ Antitrust Division.[78] As for international air transportation, the report concluded that Pan American's dominance in the market was the "result of its use of devices to foreclose competition in order to secure and maintain control over markets in which it does business," and recommended that the CAB undertake a broad investigation of the company.[79]

In other cases, the Committee investigated matters that were currently under review by antitrust enforcers. In a 1957 report on the broadcast television industry, which was quickly reshaping Americans' consumption of news and entertainment, the then-named Antitrust Subcommittee described the anticompetitive tactics CBS and NBC were using to promote their own content at the expense of independent content producers.[80] According to the report, networks were improperly using their power as vertical distributors of content to extract financial concessions from independent competitors seeking to place their programming on network affiliates.[81] There was also evidence that the networks were using their substantial power with advertisers to unfairly favor their own content.[82] After praising the DOJ Antitrust Division's "alertness to vindicate the competitive dictates of the antitrust laws," the Subcommittee urged the Division to press its investigation into this conduct with "vigor and dispatch."[83]

In the case of the Committee's inquiry into the RBOCs' conduct in the aftermath of the 1984 breakup of AT&T, we concluded that federal courts and regulators were not adequately protecting competition in the telecommunications marketplace and that new legislation was necessary. A 1992

Committee report reviewed the long, troubled history of attempts by DOJ and the FCC[84] to check the monopolistic power of AT&T, culminating in the famous Modified Final Judgment (the "MFJ") that Judge Harold Greene approved in August 1982 to break up the company.[85] But even after the MFJ, the report found, the FCC had failed to prevent the RBOCs from using their local monopolies to commit a number of anticompetitive violations, "many eerily reminiscent of pre-divestiture Bell System abuses."[86] We were also critical of the DOJ's actions to water down the MFJ's procompetitive line-of-business restrictions on the RBOCs. Describing the massive lobbying campaign that the RBOCs were waging to enter the business lines the MFJ had opened up to competitors, we observed, "The thousands upon thousands of competitive enterprises now thriving in information service, telecommunications equipment, and long distance markets face the prospect of their future prosperity being decided by the self-interested designs of a monopoly with 'bottleneck' control over the local telephone exchange on which they all depend."[87] In light of the antitrust agencies' demonstrated failure to protect competition, the Committee approved legislation that would codify the MFJ's line-of-business restrictions into law.[88]

Finally, in these prior investigations, the Committee has not hesitated to recommend that antitrust authorities further investigate suspicious conduct. After examining the conduct of the Air Transport Association of America, the industry group representing the established passenger airline carriers in the 1950s, the Antitrust Subcommittee recommended that the Antitrust Division of the Department of Justice further investigate the "serious antitrust problems" it had identified.[89]

III. BACKGROUND

A. Overview of Competition in Digital Markets

1. The Role of Competition Online

At a fundamental level, competition has been a key engine of economic activity in the United States,[90] resulting in the "pioneering of entire industries that, in time, come to employ millions and generate trillions."[91] This is especially true in the digital economy. As in other industries, competition in digital markets incentivizes incumbent firms and new entrants to build new technologies and improve business processes.[92] It spurs capital investment and incentivizes firms to improve the quality of their offerings.[93] In its absence, incumbent firms lack the incentive to invest in research and development.[94] This in turn slows the rate of innovation across the industry.[95] Disruptive new products or services are replaced with slow, incremental alterations[96] "designed to protect [incumbent firms'] existing revenue streams."[97] Slowly but surely, venture capitalists lose the incentive to invest in new

entrants willing to challenge the dominance of incumbent firms through direct competition.[98] What we are left with are so-called "kill zones"— the near-complete absence of competition.

The benefits of robust competition in the digital economy go beyond innovation and productivity. It can also spur firms to compete along other dimensions such as privacy and data protection. As a general matter, inadequate competition not only leads to higher prices and less innovation in many cases, but it can also reduce the quality of goods and services.[99] Given that many digital products do not charge consumers directly for services, these firms often compete on quality.[100] Along these lines, lack of competition can result in eroded privacy and data protection.[101] Growing evidence indicates that a lack of competition goes hand in hand with just such quality degradation.[102]

2. Market Structure

a. Winner-Take-All Markets

Certain features of digital markets—such as network effects, switching costs, the self-reinforcing advantages of data, and increasing returns to scale—make them prone to winner-take-all economics.[103] As a result, many technology markets "tip" in favor of one or two large companies,[104] shifting the "the competitive process from competition *in* the market to competition *for* the market."[105] In turn, high barriers to entry may diminish the ability of new firms to challenge incumbent firms, further undermining the competitive process and protecting

Ohlhausen, Partner, Baker Botts L.L.P.); Data and Privacy Hearing at 3–4 (statement of Jason Furman, Prof. of the Practice of Econ. Pol'y, Harvard Kennedy Sch.); 1 (statement of George Slover, Justin Brookman & Jonathan Schwantes) ("[A] dominant platform can disregard the interests of consumers in protecting their privacy, and design their platform to maximize its ability to monitor, monetize, and manipulate our personal interactions as consumers and as citizens.").

[102] Data and Privacy Hearing at 5 (statement of Tommaso Valletti, Prof. of Econs., Imperial Coll. Bus. Sch.).

[103] *Id.* at 2 (statement of Jason Furman, Prof. of the Practice of Econ. Pol'y, Harvard Kennedy Sch.) Other anticompetitive practices in digital markets—such as product design, self-preferencing, and anti-competitive contracting, among others—may also contribute to barriers that impede entry by rivals or new firms. While these issues are also present in other markets, they are much more pronounced in digital markets.

[104] *Id.*

[105] Stigler Report at 29, 35.

the dominance of existing firms.[106] As the United Kingdom's Competition and Markets Authority explains:

> [I]f potential competitors face substantial barriers to entry and expansion, such that the market is no longer properly contestable, then a high market share can translate into market power, giving the platform the opportunity to increase prices, reduce quality or leverage market power to undermine competition in potentially competitive markets and deny innovative rivals the chance to bring new services to market.[107]

b. Market Concentration

Consistent with winner-take-all dynamics, the digital economy is highly concentrated.[108] A number of key markets online—such as social media, general online search, and online advertising—are dominated by just one or two firms.[109] In some instances, this concentration is the result of a high volume of acquisitions by the dominant digital platforms. Together, the largest technology firms have acquired hundreds of companies in the last ten years.[110] Antitrust enforcers in the United States did not block any of these transactions,[111] many of which eliminated actual or potential competitors.[112] In some instances these acquisitions enabled the dominant firm to neutralize a competitive threat; in other instances, the dominant firm shut down or discontinued the underlying product entirely—transactions aptly described as "killer acquisitions."[113]

[113] Colleen Cunningham, Florian Ederer & Song Ma, *Killer Acquisitions* 1 (Yale Sch. of Mgmt. Working Paper, 2020), https://ssrn.com/abstract=3241707 (describing the practice whereby "an incumbent firm may acquire an innovative target and terminate the development of the target's innovations to preempt future competition"). *See also* C. Scott Hemphill & Tim Wu, *Nascent Competitors*, 168 U. PA. L. REV. (forthcoming 2020) (manuscript at 2), https://perma.cc/62HH-34ZL ("A nascent competitor is a firm whose prospective innovation represents a serious future threat to an incumbent.").

Evidence also suggests that the venture capital industry, which plays a critical role in funding innovative startups, contributes to market consolidation by encouraging startups to exit via a sale to an incumbent firm.[114] As initial public offerings (IPOs) have become more expensive and time-consuming in recent decades, venture capitalists have shown a preference for realizing their investments through acquisitions rather than through public markets.[115]

c. The Role of Online Platforms as Gatekeepers

As Amazon, Apple, Facebook, and Google have captured control over key channels of distribution, they have come to function as gatekeepers. A large swath of businesses across the U.S. economy now depend on these gatekeepers to access users and markets. In interviews with Subcommittee staff, numerous businesses described how dominant platforms exploit this gatekeeper power to dictate terms and extract concessions that third parties would not consent to in a competitive market.[116] According to these companies, these types of concessions and demands carry significant economic harm but are "the cost of doing business" given the lack of options.

Their role as gatekeepers also gives the dominant platforms outsized power to control the fates of other businesses. Reflecting this fact, several major publicly owned firms that rely on the dominant platforms have noted in investor statements that this dependent relationship creates an inherent risk to their businesses.[117] For example, Lyft, a ride-sharing company, has cited its use of Amazon's cloud services and Google Maps as a potential risk to its business model.[118] As Lyft stated in a filing, "Some of our competitors or technology partners may take actions which disrupt the interoperability of our platform with their own products or services."[119] Pinterest, a photo-sharing service, likewise noted in a financial filing that changes to Google's search algorithm may harm Pinterest. As it noted, Pinterest's "ability to maintain and increase the number of visitors directed to our service from search engines is not within our control. Search engines, such as Google, may modify their search algorithms and policies or enforce those policies in ways that are detrimental to us."[120] In submissions and interviews with Subcommittee staff, many companies reiterated the general concern that a single act or decision by one of the dominant platforms could wreck their businesses.

[118] *Id.*

[119] *Id.*

[120] *Id.*

Since the dominant platforms in many cases have also integrated into adjacent lines of business, these firms operate both as key intermediaries for third-party companies as well as direct competitors to them. Numerous entrepreneurs, small businesses, and major companies told Subcommittee staff that the dominant platforms' dual role raises significant competition concerns.[121] In recent years, significant reporting has documented how the dominant platforms can exploit this dual role, through data exploitation,[122] self-preferencing,[123] appropriation of key technologies,[124] and abrupt changes to a platform's policies.[125] The Subcommittee's investigation uncovered numerous examples of this exploitative conduct, suggesting that these are increasingly systemic, rather than isolated, business practices.

3. Barriers to Entry

a. Network Effects

Digital markets tend to be characterized by strong network effects, making them prone to concentration and monopolization.[126] There are two types of network effects: direct and indirect. In markets with direct network effects, the more people who use a product or service, the more valuable that product or service becomes to other users.[127] By contrast, indirect network effects arise when greater use of a product or service forms a new type of standard and increases the incentive for third parties to invest in developing compatible technologies, which in turn reinforces the popularity of the original product or service with users.[128]

[127] *See* Luigi Zingales & Guy Rolnik, *A Way To Own Your Social-Media Data*, N.Y. TIMES (June 30, 2017), https://www.nytimes.com/2017/06/30/opinion/social-data-google-facebook-europe.html.

[128] MAURICE E. STUCKE & ALLEN P. GRUNES, BIG DATA AND COMPETITION POLICY 163 (2016).

Online platforms display strong network effects because they connect disparate market segments. For example, online commerce platforms like Amazon connect buyers and sellers. Just as with social networks, the value of Amazon Marketplace increases as more users—both sellers and buyers—engage with the platform.[129] Similarly, the value of online platforms that facilitate advertising, such as Google, increases with the number of users, as advertisers gain access to a larger consumer base and therefore to a larger trove of consumer data.[130]

Similarly, social networks like Facebook exhibit powerful direct network effects because they become more valuable as more users engage with the network—no person wants to be on a social network without other users.[131] Meanwhile, once a firm captures a network it can become extremely difficult to dislodge or replace. As Mark Zuckerberg explained to then-CFO David Ebersman the benefits that would accrue to Facebook from acquiring Instagram:

> [T]here are network effects around social products and a finite number of different social mechanics to invent. Once someone wins at a specific mechanic, it's difficult for others to supplant them without doing something different. It's possible someone beats Instagram by building something that is better to the point that they get network migration, but this is harder as long as Instagram keeps running as a product.[132]

Strong network effects serve as a powerful barrier to entry for new firms to enter a market and displace the incumbent.[133] When combined with other entry barriers such as restrictions on consumers or businesses easily switching services, network effects all but ensure not just market concentration but durable market power.[134]

b. Switching Costs

Switching costs present another barrier for potential market entrants. In many cases, large technology firms can maintain market power in part because it is not easy for users to switch away from the incumbent's technology. A market exhibits "lock-in" when switching costs are sufficiently high that users stay with an incumbent firm rather than switch to a firm whose product or service they

[134] *See* Dig. Competition Expert Panel Report at 35.

would prefer.[135] Over time, lock-in tends to reduce competition, deter market entry, and may even worsen data privacy.[136]

High switching costs are a central feature of digital search and social media platforms, such as Google and Facebook, where users contribute data to the platform but may not be able to migrate that data to a competing platform. For example, a user may upload a variety of data to Facebook, including photos and personal information, but may not be able to easily download that data and move it to another social media site; instead, the user would have to start from scratch, re-uploading her photos and re-entering her personal information to the new platform.[137] An online seller who has generated hundreds of product reviews and ratings on Amazon may face a similar challenge when considering migrating to a different platform. Other significant factors that contribute to switching costs in digital markets include anticompetitive contracting terms, default settings, product design that favor dominant platforms.[138]

c. Data

The accumulation of data can serve as another powerful barrier to entry for firms in the digital economy. Data allows companies to target advertising with scalpel-like precision, improve services and products through a better understanding of user engagement and preferences, and more quickly identify and exploit new business opportunities.[139]

Much like a network effect, data-rich accumulation is self-reinforcing. Companies with superior access to data can use that data to better target users or improve product quality, drawing more users and, in turn, generating more data—an advantageous feedback loop.[140] In short, new users and greater engagement bring in more data, which enables firms to improve user experiences and develop new products—in turn capturing more data.[141] While data is non-rivalrous—meaning that one party's

[138] Dig. Competition Expert Panel Report at 36. Unlike the European Union, which provides internet users with a right to data portability, the U.S. does not have any law requiring online platforms to make data portable. Platforms like Google and Facebook are therefore largely uninhibited in imposing switching costs for users, hurting competition in the process. Allen St. John, *Europe's GDPR Brings Data Portability to U.S. Consumers*, CONSUMER. REPS. (May 25, 2018), https://www.consumerreports.org/privacy/gdpr-brings-data-portability-to-us-consumers; *see* Chris Dixon, *The Interoperability of Social Networks*, BUS. use does not prevent or diminish use by another—firms may nonetheless exclude rivals from using their data through technical restrictions and legal contracts.[142] These exclusionary tactics can close off markets and shield incumbents from competition.[143]

In addition to serving as a barrier to entry, superior access to data can enable and exacerbate anticompetitive conduct in digital markets. This is particularly true when a dominant platform operates as both a marketplace for third-party goods as well as a seller of its own products on that same marketplace.[144] Through this dual role, a dominant platform can mine commercially valuable information from third-party businesses to benefit its own competing products.[145] Additionally, a dominant platform can use its market power to extract more data from users, undermining their privacy.[146]

Persistent data collection can also create information asymmetries and grant firms access to non-public information that gives them a significant competitive edge. These insights include information on user behavior as well as on broader usage trends that enable the dominant platforms to track nascent competitive threats. In an interview with Subcommittee staff, a senior executive at a social media company referred to this ability as akin to having "a spy camera on the production floor" of a competitive threat.[147] Roger McNamee, the Co-Founder of Elevation Partners, has noted that the dominant platforms' role as digital infrastructure gives them both leverage and insights that other competitors lack:

> Essentially, the interplay of Google's dominant position in … infrastructure elements [such as] ad tech infrastructure, Chrome browser, [and Nest] … collectively provide leverage over other market participants, which include not just startups, but also advertisers, and other would-be competitors. And the key thing is, it's not just about Google's infrastructure. When you add in Gmail, Search, Maps, apps, and all the other things that Google does so well … [t]hey provide further levels of user lock-in—further protective modes that really limit the opportunity of competitors and even, frankly,

suppliers and advertisers, to do the things that they should be able to do in a freely competitive economy.[148]

This significant data advantage also enables dominant platforms to identify and acquire rivals early in their lifecycle. Leading economists and antitrust experts have expressed concern that serial acquisitions of nascent competitors by large technology firms have stifled competition and innovation.[149] This acquisition strategy exploits dominant firms' information advantages in order to acquire rapidly growing companies just before those companies become true threats.[150] Lacking access to this same information or failing to appreciate its significance, enforcers may fail to identify these acquisitions as anticompetitive. This is more likely when the dominant platform buys a nascent threat before it has fully developed into a rival.

In a briefing before Members of the Subcommittee, Jonathan Sallet, former Deputy Assistant Attorney General at the Antitrust Division, explained that data-driven acquisitions of nascent or potential rivals can significantly undermine competition while systematically evading antitrust scrutiny.[151] One reason is that upstart competitors are often data-rich but cash-poor, a combination that is unlikely under a price-centric framework to trigger antitrust scrutiny if the acquisition is priced below the relevant threshold for merger review.[152] For example, had Microsoft sought to exploit its monopoly power in the market for personal computer operating systems by *acquiring* Netscape—rather than by foreclosing it—it is unlikely that antitrust enforcers would have taken action. He noted that this type of acquisition can tip the market in favor of a dominant firm, having the same ultimate effect as monopolistic conduct but escaping the antitrust enforcement that monopolistic conduct has triggered in the past.[153]

d. Economies of Scale and Scope

Increasing returns to scale are another feature of technology markets that make them prone to tip towards concentration and monopolization.[154] In markets with increasing returns to scale, as sales increase, average unit cost decreases.[155] Because entry into these markets requires significant up-front costs, the market favors firms that are already large, making it difficult for new firms to enter the market and challenge large incumbents.[156]

Likewise, a dominant firm that enjoys economies of scope can extend its reach across adjacent markets through an expansive ecosystem of its own products while incurring relatively low cost.[157] For example, if a firm has sufficient technical expertise or access to consumer data, the cost of applying this resource into a new market is relatively low.

Businesses that specialize in providing information, such as Google, frequently benefit from increasing returns to scale.[158] These businesses require high upfront fixed costs, but then may scale with relatively low increases in cost. For example, "Google can update Google Calendar for 100 million users with similar fixed expenses as would be needed for only a fraction of such users."[159] Facebook is another company that benefits from increasing returns to scale.[160] Although building the Facebook platform required a large upfront investment, the platform was able to grow exponentially with relatively little increase in costs. With the benefit of increasing returns to scale, Facebook was able to grow from one million users in 2004, the year of its founding, to more than 350 million users in only five years.[161]

Recent economic evidence indicates that economies of scale achieved through data collection allow platforms to get more out of consumers than consumers get out of platforms.[162] In exchange for "free" services, users provide valuable *social* data—information that may also shed light on other people's behavior—in addition to their own *personal* information. For instance, a person's location

history using Google Maps reveals valuable and sensitive information about others as well—such as traffic patterns and other data. According to Professors Dirk Bergemann, Alessandro Bonatti, and Tan Gan, the creation of this "data externality" means that, for firms like Google, Amazon, and Facebook, "the cost of acquiring … individual data can be substantially below the value of the information to the platform."[163] In other words, notwithstanding claims that services such as Google's Search or Maps products or Facebook are "free" or have immeasurable economic value to consumers,[164] the social data gathered through these services may exceed their economic value to consumers.

B. Effects of Platform Market Power

1. Innovation and Entrepreneurship

Competition is a critical source of innovation, business dynamism, entrepreneurship, and the "launching of new industries."[165] Vigorously contested markets have been a critical competitive asset for the United States over the past century.[166] While large firms with significant resources may invest in research and development for new products and services, competition forces companies to "run faster" in order to offer improved products and services.[167] Without competitive pressure, some level of innovation may still occur, but at a slower, iterative pace than would be present under competitive market conditions.[168]

In recent decades, however, there has been a sharp decline in new business formation as well as early-stage startup funding.[169] The number of new technology firms in the digital economy has declined,[170] while the entrepreneurship rate—the share of startups and young firms in the industry as a

whole—has also fallen significantly in this market.[171] Unsurprisingly, there has also been a sharp reduction in early-stage funding for technology startups.[172]

The rates of entrepreneurship and job creation have also declined over this period. The entrepreneurship rate—defined as the "share of startups and young firms" in the industry as a whole—fell from 60% in 1982 to a low of 38% as of 2011.[173] As entry slows, the average age of technology firms has skewed older.[174] Job creation in the high-technology sector has likewise slowed considerably.[175] In 2000, the job creation rate in the high-technology sector was approaching 20% year-over-year. Within a decade, the rate had halved to about 10%.[176] Although the job creation rate in the high-technology sector has fallen substantially since the early 2000s, the job destruction rate in 2011 was roughly unchanged from 2000.[177] As a result, in 2011 the rate of job destruction in the high-technology sector was higher than the rate of job creation, a reversal from the year 2000, when the job-creation rate far outpaced the job-destruction rate.[178]

In line with this trend, there is mounting evidence that the dominance of online platforms has materially weakened innovation and entrepreneurship in the U.S. economy.[179] Some venture capitalists, for example, report that they avoid funding entrepreneurs and other companies that compete directly with dominant firms in the digital economy.[180]

Often referred to as an innovation "kill zone," this trend may insulate powerful incumbent firms from competitive pressure simply because venture capitalists do not view new entrants as good

investments.[181] Albert Wenger, the managing partner of Union Square Ventures, commented that the "scale of these companies and their impact on what can be funded, and what can succeed, is massive."[182] Paul Arnold, an early-stage investor and founder of Switch Ventures, commented at the Justice Department's recent workshop on the intersection between venture capital and antitrust law that he considers markets dominated by large platforms to be kill zones.[183] He explained:

> [T]here's an incredibly, concentrated market share because of the economies of scale or because of network effects, it's a really hard barrier to overcome. And sometimes there's an answer and often, that will kill things. And I think that that's my view, that's my, sort of, lived experience as a venture investor, but I think it's a common view of a lot of venture investors.[184]

In the same vein, Mr. Arnold said in a submission to the Subcommittee that:

> Venture capitalists are less likely to fund startups that compete against monopolies' core products … As a startup investor, I see this often. For example, I will meet yet another founder who wants to disrupt Microsoft's LinkedIn. They will have a clever plan to build a better professional social network. I always pass on the investment. It is nearly impossible to overcome the monopoly LinkedIn enjoys. It is but one example of an innovation kill zone.[185]

For example, the entrenched power of firms with weak privacy protections has created a kill zone around the market for products that enhance privacy online.[186] To the extent that a firm successfully offers a service to give people tools to control their privacy, "Google or Facebook are going to want to pull that back as fast as they possibly can. They don't want you aggressively limiting their extremely valuable information collection."[187]

Other prominent venture capitalists, such as Roger McNamee, the Co-Founder of Elevation Partners, have commented that these trends harm more than just startups. The advantages of dominant

[187] *Id.*

firms online—access to competitively significant sources of data, network effects, intellectual property, and excess capital—are "a barrier to a wide range of activities, not just startups, but actually a lot of other market participants."[188]

Merger activity may be another contributor to reduced venture capital investment of startups. In a recent study, several leading economists and researchers at the University of Chicago—Raghuram G. Rajan, Luigi Zingales, and Sai Krishna Kamepalli—found that major acquisitions by larger firms in sectors of the digital economy led to significantly less investment in startups in this same sector.[189] As they note, in the wake of an acquisition by Facebook or Google, investments in startups in the same space "drop by over 40% and the number of deals falls by over 20% in the three years following an acquisition."[190]

The threat of entry from a large platform has had significant effects on other firms' incentives to innovate,[191] while the actual entry of the larger online platform can result in less innovation and an additional increase in prices.[192] During the investigation, Subcommittee staff interviewed a prominent venture capital investor in the cloud marketplace who explained that this power imbalance creates a strong economic incentive for other firms to avoid head-on competition. As he noted:

> I think of Amazon as the sun. It is useful but also dangerous. If you're far enough away you can bask. If you get too close you'll get incinerated. So, you have to be far enough from Amazon and be doing something that they wouldn't do. If you're a net consumer of Amazon's infrastructure, like Uber, then you're okay. As long as Amazon doesn't want to get into ridesharing. But it's hard to predict what Amazon wants to get into. If they were going to stop at retail and computing, you're safe. But you can't know.[193]

As discussed in this Report, other behavior by dominant firms—such as cloning the products of new entrants—may also undermine the likelihood that new entrants will be able to compete directly or that early adopters will switch to a new entrant's product, lowering the valuation of these companies as well as their profitability.[194]

In July 2019, the Subcommittee held a hearing to examine the effects of market power on innovation and entrepreneurship. There, a panel of experts noted that the lack of competitive pressure in the U.S. economy has reduced innovation and business formation, while also allowing dominant firms to control innovation.[195] Professor Tim Wu of Columbia Law School, a pioneer in internet policy, said that there is:

> [N]o question as to whether there were barriers to entry and whether the tech economies have, in fact, become a very difficult place for people to get started . . . the decline in the number of startups, almost unthinkable in the United States, which has always had a comparative advantage in being the place where startups will get their start.[196]

Professor Fiona Scott Morton of the Yale University School of Management reinforced this concept in her testimony, noting that insufficient competition has given dominant firms the ability to channel innovation in the direction they prefer "rather than being creatively spread across directions chosen by entrants."[197]

In addition to innovation harms in the digital marketplace, Stacy Mitchell, the Co-Director of the Institute for Local Self Reliance, explained that entrepreneurism among locally owned businesses has also suffered as a result of this power. As she noted, "Local businesses are disappearing and, with them, a pathway to the middle class. Producers are struggling to invest in new products and grow their companies. New business formation is down to historic lows."[198]

At the Subcommittee's field hearing, senior executives representing different businesses across the economic spectrum offered similar testimony about the effects of market power on innovation and entrepreneurship. Patrick Spence, the CEO of Sonos, testified that the lack of fair competition diminishes innovation, particularly for firms that cannot afford to sell products at a loss.[199] He explained:

> These companies have gone so far as demanding that we suppress our inventions in order to work with them. The most recent example of this is Google's refusal to allow

[199] Competitors Hearing at 7 (statement of Patrick Spence, CEO, Sonos, Inc.).

> us to use multiple voice assistants on our product simultaneously. . . . I think the whole spirit of trying to encourage small companies, encourage new innovations and new startups is at risk, given how dominant these companies are.[200]

Furthermore, the ability of a dominant firm to extract economic concessions from smaller companies that rely on it to reach the market can also depress innovation. David Barnett, the CEO and Founder of PopSockets, testified at the field hearing that Amazon required his company "to pay almost two million in marketing dollars in order to remove illegal product from the Amazon marketplace."[201] In response to questions from Representative Ken Buck (R-CO) on the effect of this policy on innovation, Mr. Barnett testified that this money could have been used to double the number of employees dedicated to developing innovative products at the company.[202]

2. Privacy and Data Protection

The persistent collection and misuse of consumer data is an indicator of market power in the digital economy.[203] Traditionally, market power has been defined as the ability to raise prices without a loss to demand, such as fewer sales or customers.[204] Scholars and market participants have noted that even as online platforms rarely charge consumers a monetary price—products appear to be "free" but are monetized through people's attention or with their data[205]—traditional assessments of market power are more difficult to apply to digital markets.[206]

The best evidence of platform market power therefore is not prices charged but rather the degree to which platforms have eroded consumer privacy without prompting a response from the market.[207]

As scholars have noted, a platform's ability to maintain strong networks while degrading user privacy can reasonably be considered equivalent to a monopolist's decision to increase prices or reduce product quality.[208] A firm's dominance can enable it to abuse consumers' privacy without losing customers.[209] In the absence of genuine competitive threats, a firm offers fewer privacy protections than it otherwise would. In the process, it extracts more data, further entrenching its dominance.[210] When paired with the tendency toward winner-take-all outcomes, consumers are forced to either use a service with poor privacy safeguards or forego the service altogether.[211] As the United Kingdom's Competition and Markets Authority observes, "The collection and use of personal data by Google and Facebook for personalised advertising, in many cases with no or limited controls available to consumers, is another indication that these platforms do not face a strong enough competitive constraint."[212]

Given the increasingly critical role platforms play in mediating access to everyday goods and services, users are also far more likely to surrender more information than to cease using the service entirely.[213] Without adequate competition, firms are able to collect more data than a competitive market would allow,[214] further entrenching their market power while diminishing privacy in the process.[215]

Because persistent data collection online is often concealed,[216] it is more difficult to compare privacy costs across different products and services.[217] Consumers are largely unaware of firms' data collection practices, which are presented in dense and lengthy disclosures.[218] The use of manipulative design interfaces has also become a pervasive tool "to increase the likelihood of users consenting to tracking."[219] These behavioral nudges—referred to as dark patterns—are commonly used in online tracking and advertising markets to enhance a firm's market power and "maximize a company's ability to extract revenue from its users."[220] And in e-commerce, Jamie Luguri and Lior Strahilevitz observe that dark patterns "are harming consumers by convincing them to surrender cash or personal data in deals that do not reflect consumers' actual preferences and may not serve their interests. There appears to be a substantial market failure where dark patterns are concerned—what is good for ecommerce profits is bad for consumers."[221]

More recently, as remote work became commonplace during the COVID-19 pandemic, Google attempted to manipulate users into using its Google Meet videoconferencing tool instead of upstart competitor Zoom. As Zoom emerged as the market leader during the early stages of the pandemic, Google introduced a new widget for Meet inside Gmail. A similar message could be found inside Google Calendar, which prompted users to "Add Google Meet video conferencing" to their appointments. "For people with the Zoom Video Communications Inc. extension on their Chrome browsers, the prompt sits directly above the option to: 'Make it a Zoom Meeting.'"[222]

[222] Mark Bergen, *Google Really Wants You to Try Its New Video Tool*, BLOOMBERG (May 19, 2020), https://www.bloomberg.com/news/newsletters/2020-05-19/google-really-wants-you-to-try-its-new-video-tool.

To the extent that consumers are aware of data collection practices, it is often in the wake of scandals involving large-scale data breaches or privacy incidents such as Cambridge Analytica.[223] As Dina Srinivasan notes, "Today, nuances in privacy terms are relegated to investigative journalists to discover and explain. When the media does report on them—as they did around Google's practice of letting employees and contractors read Gmail users' emails—consumers often switch to a competitor that offers a better product or service."[224] The opacity of data collection and use contributes to consumer confusion and the misperception that consumers do not care about their privacy—the so-called privacy paradox—simply because they use services that have become essential.[225]

While insufficient competition can lead to reduced quality in many markets, the loss of quality due to monopolization—and in turn, privacy and data protection—is even more pronounced in digital markets because product quality is often the "relevant locus of competition."[226] Without transparency or effective choice, dominant firms may impose terms of service with weak privacy protections that are designed to restrict consumer choice,[227] creating a race to the bottom.[228] As David Heinemeier Hansson, the Co-Founder and Chief Technology Officer of Basecamp,[229] explained in his testimony before the Subcommittee:

> When businesses do not have to account for the negative externalities they cause, it's a race to the bottom. The industrial-scale exploitation of privacy online is much the same. Facebook and Google have built comprehensive dossiers on almost everyone, and they can sell incredibly targeted advertisement on that basis. When Facebook knows you're pregnant, or worse, thinks it knows when you're pregnant, they can target ads for baby clothes or strollers with striking efficiency. But doing so represents an inherent violation of the receiver's privacy. Every ad targeted using personal information

> gathered without explicit, informed consent is at some level a violation of privacy. And Facebook and Google are profiting immensely by selling these violations to advertisers. Advertisers who may well feel that purchasing these violations go against their ethics, but see no choice to compete without participating.[230]

In addition to creating a race to the bottom, this same dynamic can also prevent new firms from offering products with strong privacy protections or reduce the incentive of new entrants or rivals to compete directly.[231] Roger McNamee, the Co-Founder and Managing Director of Elevation Partners, has also explained that to the extent there is direct competition between a firm with a privacy-centric business model, such as DuckDuckGo's search engine, they can "still have trouble applying different business models once they're not compatible with the business models that have made the Internet platforms so successful."[232]

Conversely, without adequate safeguards in place, measures that appear to improve privacy for consumers may also have anticompetitive effects. Kirsten Daru, Chief Privacy Officer and General Counsel of Tile, told the Subcommittee: "Apple has used the concept of privacy as a shield by making changes in the name of privacy that at the same time give it a competitive advantage."[233] In particular, she testified at the Subcommittee's field hearing:

> Apple has attempted to justify its own collection of sensitive information and disparate treatment of competitors because FindMy is 'part of the OS,' as well as due to a need for enhanced consumer privacy. But the changes don't meaningfully improve or enhance privacy of third-party app developers.[234]

Ram Shriram, a prominent investor who is a founding board member of Google, noted that "[p]rivacy does impact how you think about dominance, for example, in a market because Google and Apple both eliminated third-party cookies, which then makes your data a little more private. But it ironically will hurt the young companies that are trying to build digital advertising businesses while improving user privacy.[235]

The Subcommittee held several hearings during the investigation that examined the role of competition and privacy online.

In September 2016, the Subcommittee held a hearing on the role of data and privacy in competition. There, Federal Trade Commissioner Rohit Chopra testified that dominant firms have the ability to impose "complex and draconian" terms of service that can change suddenly "to collect and use data more expansively and more intensely."[236] As he noted, this behavior is the equivalent of a price hike that would be difficult to impose unilaterally in a competitive marketplace.[237] Without sufficient competition, however, "companies can focus on blocking new entrants and limiting choice to protect their dominance and pricing power."[238] Tommaso Valletti, the former Chief Competition Economist for the European Commission, noted that it is "self-evident that data is key to digital platforms, and that some applications imply real-time knowledge of consumer behaviour as well as cross linkages across apps that only very few digital players have access to."[239] And finally, Jason Furman, the former Chairman of the Council of Economic Advisers and an author of the "Unlocking Digital Competition" report, said that "the misuse of consumer data and harm to privacy is arguably an indicator of low quality caused by a lack of competition."[240]

At the Subcommittee's oversight hearing in November 2019, Makan Delrahim, the Assistant Attorney General of the Justice Department's Antitrust Division, testified that because privacy is a dimension of quality, protecting competition "can have an impact on privacy and data protection."[241] And finally, Maureen Ohlhausen, the former Acting Chair of the FTC, echoed this point at the Subcommittee's hearing on innovation and entrepreneurship, noting that quality reductions online could "include factors such as reduced features, restricted consumer choice, or lessened control over privacy."[242]

Leading international antitrust enforcers offered similar testimony before the Subcommittee. Margrethe Vestager, the European Union's Competition Commissioner, testified that due to the Commission's finding that data protection is an important dimension of competition that could be undermined by certain merger activity, the Commission "has … integrated, where appropriate, data protection as a quality parameter for the assessment of merger cases."[243] Similarly, Rod Sims, the

3. The Free and Diverse Press

A free and diverse press is essential to a vibrant democracy. Whether exposing corruption in government, informing citizens, or holding power to account, independent journalism sustains our democracy by facilitating public discourse.

Since 2006, newspaper advertising revenue, which is critical for funding high-quality journalism, fell by over 50%.[245] Despite significant growth in online traffic among the nation's leading newspapers,[246] print and digital newsrooms across the country are laying off reporters or folding altogether.[247] As a result, communities throughout the United States are increasingly going without sources for local news. The emergence of platform gatekeepers—and the market power wielded by these firms—has contributed to the decline of trustworthy sources of news.[248]

a. Journalism in Decline

Since 2006, the news industry has been in economic freefall, primarily due to a massive decrease in advertising revenue. Both print and broadcast news organizations rely heavily on advertising revenue to support their operations, and as the market has shifted to digital platforms, news organizations have seen the value of their advertising space plummet steeply.[249] For newspapers, advertising has declined from $49 billion in 2006 to $16.5 billion in 2017.[250] This decrease has been

felt by national and local news sources alike. As total annual advertising revenues have fallen over 62% across the industry since 2008, one major national newspaper told the Subcommittee that its annual advertising revenue has fallen 48% over that period.[251] Additionally, ethnic news outlets have suffered from the shift from broadcast and print ads to digital ads.[252] Regarding television and radio broadcast news, the National Association of Broadcasters told the Subcommittee, "[T]his year, the U.S. advertising revenue of a single company—Google—are projected to exceed the *combined* ad revenue of *all* TV and radio stations in the country by over $8 billion."[253]

While the decline of advertising revenue has most severely affected local news publishers, prominent digital publishers have also been affected. In January 2019, Buzzfeed announced layoffs of 220 employees, about 15% of its workforce, due to advertising losses.[254] Jonah Peretti, the Chief Executive Officer of BuzzFeed, commented prior to the layoffs that consolidation of digital publishers into a single large digital media company may be the only path forward for profitability, suggesting that publishers' lack of bargaining power in negotiations with online platforms is the central obstacle to long-term survival.[255]

Despite a recent boost in the number of digital subscriptions and the level of online traffic for the top newspapers in the United States, these increases did not offset losses in online advertising or circulation in the industry overall.[256] As one news publisher told the Subcommittee, "For the vast majority of news publishers, digital subscription revenues remain a minor revenue stream and do not appear to be on a path to replace the decline in print subscriptions."[257] Over the past two decades,

hundreds of local news publishers have been acquired or gone bankrupt.[258] In some cases, private equity firms and hedge funds have purchased major regional chains and newspapers, resulting in mass layoffs of journalists and increased debt burdens for publishers.[259]

In recent years, news consumption has largely shifted to a model of content aggregation, through which platforms consolidate content from multiple news sources.[260] In submissions to the Subcommittee and public statements, publishers across the spectrum say they have little choice but to participate in content aggregation, particularly those run by dominant platforms because the aggregators' "use of news publishers' content does send substantial traffic to news publishers."[261] But this can also prevent traffic from flowing to newspapers. As some publishers have noted, news aggregators package and present content to users using attention-grabbing quotes from high points of stories, which can make it unnecessary for the user to click through to the publisher's website.[262] As these publishers noted, this dynamic forces news organizations to effectively compete with their own content, lowering the potential revenue from user traffic to news organizations' websites.[263]

As a result of falling revenues, newspapers and broadcast stations are steadily losing the ability to financially support their newsrooms, which are costly to maintain but provide immense value to their communities.[264] A robust local newsroom requires the financial freedom to support in-depth, sometimes years-long reporting, as well as the ability to hire and retain journalists with expertise in fundamentally local issues, such as coverage of state government.[265]

The societal value of local news is significant**.** As noted by the National Association of Broadcasters, local broadcast stations provide on-the-air programming which is "rooted in localism and the public interest," offering content which "[is] still free to the public and accessible to all Americans."[266] Kevin Riley, the editor of *The Atlanta Journal-Constitution*, similarly testified before

the Subcommittee that "it would be impossible to even put a cost estimate on the work" of local journalists.[267]

The COVID-19 pandemic has particularly highlighted the importance of local news sources. Despite taking major revenue losses,[268] local journalists have provided valuable reporting on the transmission of the novel coronavirus, particularly for underserved and vulnerable communities.[269] For example, PBS New Mexico provided an in-depth focus on the effects of the coronavirus on Native Americans "dealing with scarce resources as they respond to novel coronavirus outbreaks on tribal lands."[270] Apart from serving their communities, local news stories bring national attention to these critical issues.[271] In addition to news coverage, the National Association of Broadcasters aired public-service announcements in response to the pandemic "more than 765,000 times for an estimated ad value of more than $156,500,000," a number which "do[es] not include the likely much greater number of other coronavirus-related PSAs" aired by local television and radio stations across the United States.[272]

To run a new operation, broadcast stations must be able to sustain "the basic costs of running a station, including engineering, sales, [and] programming" costs, and must make significant capital expenditures in equipment, such as satellite trucks.[273] These expenses must be satisfied before broadcast stations can invest in improvements to keep pace with changing technologies, "including ultra-high definition programming, better emergency alerting, mobile services, interactivity, hyper-local content and more."[274]

The costs of news production add up. From 2003 to 2013, these costs "accounted for nearly 24 percent of TV stations' total expenses (and nearly 26 percent of the total expenses of ABC/CBS/Fox/NBC stations)."[275] In light of the expenses associated with producing high-quality

journalism, declining revenue has major implications for the maintenance—let alone enrichment—of quality news production.

Budget cuts have also led to a dramatic number of newsroom job losses. This decline has been primarily driven by a reduction in newspaper employees, who have seen employment fall by half over a recent eight-year period, from 71,000 in 2008 to 35,000 in 2019.[276] In 2019 alone, 7,800 media industry employees were laid off.[277] The Bureau of Labor Statistics estimates that the total employment of reporters, correspondents, and broadcast news analysts will continue to decline by about 11% between 2019 and 2029.[278]

Researchers at the University of North Carolina School of Media and Journalism found that the United States has lost nearly 1,800 newspapers since 2004 either to closure or merger, 70% of which were in metropolitan areas.[279] As a result, the majority of counties in America no longer have more than one publisher of local news, and 200 without any paper.[280] At the Subcommittee's hearing on online platforms' effects on a free and diverse press, Mr. Riley described this new media landscape characterized by digital platform dominance and disappearing local newspapers:

> We produce journalism that is distinguished by its depth, accuracy and originality. That costs money and is expensive, but if the system works correctly, it also makes money that the paper uses to investigate and develop the next story or cover the next local event. If others repackage our journalism and make money off it, yet none of that money makes its way back to the local paper, then it makes breaking that next story or exposing the next scandal more challenging. If that cycle continues indefinitely, quality local journalism will slowly wither and eventually cease to exist.[281]

AR_003352

This cycle has a profoundly negative effect on American democracy and civic life. Communities without quality local news coverage have lower rates of voter turnout.[282] Government corruption may go unchecked, leaving communities vulnerable to serious mismanagement.[283] Relatedly, these communities see local government spending increase.[284] Towns without robust local news coverage also exhibit lower levels of social cohesion, undermining a sense of belonging in a community.[285] As fewer publishers operate in local markets, local news is supplanted by aggregation of national coverage, reducing residents' knowledge of local happenings and events, and generally leaving them less connected to their communities.[286]

Compounding this problem, the gap created by the loss of trustworthy and credible news sources has been increasingly filled by false and misleading information. Once communities lack a local newspaper source, people tend to get their local news from social media. As local news dies, it is filled by unchecked information, some of which can spread quickly and can have severe consequences.

b. The Effect of Market Power on Journalism

During the Subcommittee's investigation, news publishers raised concerns about the "significant and growing asymmetry of power" between dominant online platforms and news publishers, as well as the effect of this dominance on the production and availability of trustworthy sources of news. In interviews, submissions, and testimony before the Subcommittee, publishers with distinct business models and distribution strategies said they are "increasingly beholden" to these firms, and in particular, Google and Facebook.[287] As a result, several dominant firms have an outsized

287 Submission from Source 220, to H. Comm. on the Judiciary, 7 (Oct. 14, 2019) (on file with Comm.). Although Apple News and Apple News Plus are increasingly popular news aggregators, most market participants interviewed by Subcommittee staff do not view it as a critical intermediary for online news at this time, although some publishers raised concerns about the tying of payments inside Apple's news product.

influence over the distribution and monetization of trustworthy sources of news online,[288] undermining the availability of high-quality sources of journalism.[289]

i. Distribution of News Online

Several dominant platforms function as intermediaries to news online. Due to their outsized role as digital gateways to news, a change to one of these firm's algorithm can significantly affect the online referrals to news publishers,[290] directly affecting their advertising revenue.[291] One news publisher stated in its submission to the Subcommittee that it and other news organizations "depend on a few big tech platforms to help them distribute their journalism to consumers."[292]

In submissions to the Subcommittee, several news publishers noted that the dominance of Google and Facebook allows them to "pick winners" online by adjusting visibility and traffic.[293] For example, an update to Google's search algorithm in June 2019 decreased a major news publisher's online traffic "by close to 50%" even as their referrals from other sources—such as their home page and apps—grew during the same period.[294] As they noted, a "smaller business would have been crushed" by this decline.[295]

Similarly, news organizations were negatively affected when, in January 2018, Facebook adjusted its News Feed algorithm to prioritize content based on audience engagement.[296] According to an internet analytics firm, these changes significantly affected the visibility of news content on Facebook, resulting in a 33% decrease in referral traffic from Facebook to news publishers' sites.[297] As one publisher noted in its submission to the Subcommittee, this change "was made without notice,

consultation or warning to the market, [leading] to significant disruption for a range of businesses."[298] Nicholas Thompson, the Editor-in-Chief of *Wired* magazine, and *Wired* contributing editor Fred Vogelstein described the relationship between publishers and Facebook as being "sharecroppers on Facebook's massive industrial farm," writing that:

> Even at the best of times, meetings between Facebook and media executives can feel like unhappy family gatherings. The two sides are inextricably bound together, but they don't like each other all that much. . . . And then there's the simple, deep fear and mistrust that Facebook inspires. Every publisher knows that, at best, they are sharecroppers on Facebook's massive industrial farm. The social network is roughly 200 times more valuable than the *Times*. And journalists know that the man who owns the farm has the leverage. ***If Facebook wanted to, it could quietly turn any number of dials that would harm a publisher—by manipulating its traffic, its ad network, or its readers***.[299]

The Subcommittee has also received evidence that the dominance of several online platforms has created a significant imbalance of bargaining power. In several submissions, news publishers note that dominant firms can impose unilateral terms on publishers, such as take-it-or-leave-it revenue sharing agreements.[300] A prominent publisher described this relationship as platforms having a "finger on the scales" with the ability to suppress publishers that do not "appease platforms' business terms."[301]

During the Subcommittee's hearing on the effects of market power on journalism,[302] several witnesses also testified about the lack of equal bargaining power between news publishers and dominant platforms.[303] At the Subcommittee's hearing on market power and the free and diverse press, Sally Hubbard, Director of Enforcement Strategy at the Open Markets Institute, testified that the lack of competition online has led to diminished bargaining power among news publishers. Consequently, in response to changing terms and algorithmic treatment by platforms, "publishers have little choice but to adapt and accommodate regardless of how the changes may negatively affect their own

AR_003355

profitability."[304] David Chavern, President of the News Media Alliance, similarly testified that publishers have a "collective action problem," stating that "no news organization on its own can stand up to the platforms. The risk of demotion or exclusion from the platforms is simply too great."[305]

In June 2020, the News Media Alliance published a white paper examining the relationship between news publishers and Google based on interviews with its members over the course of more than a year.[306] As it notes, "Google has exercised control over news publishers to force them into several relationships that benefit Google at the publishers' expense."[307] In the context of Google's placement of news on accelerated mobile pages (AMP)—a format for displaying web pages on mobile devices—publishers raised concerns that "Google effectively gave news publishers little choice but to adopt it," requiring the creation of parallel websites "that are hosted, stored and served from Google's servers rather than their own."[308]

While this format has benefits in terms of loading information quickly on mobile devices, publishers argue that these benefits "could have been achieved through means that did not so significantly increase Google's power over publishers or so favor its ability to collect data to foster its market domination."[309] And when a publisher attempts to avoid this cost by moving its content behind a paywall, its rise in subscriptions was offset by declines in traffic from Google and other platforms.[310] Referring to this tradeoff as a "Hobson's choice," the News Media Alliance explained:

> Newspapers such as *The Wall Street Journal* employ a highly customized paywall on their websites, significantly varying the number of free articles that a user is permitted to read before being asked to subscribe to the newspaper. This flexibility is highly beneficial, allowing them to maximize engagement and increase subscriptions. For AMP articles, however, Google restricts the paywall options. Unless publishers rebuild their paywall options and their meters for AMP, they can only provide *all* of their content for free or *none* of their content for free. The only other option is to use Subscribe with Google, which has many benefits for Google and downsides for news publishers.[311] Accordingly, unless they invest in building another and separate paywall,

news publishers who do not want to use Subscribe with Google have a *de facto* all-or-nothing choice regarding the imposition of a paywall, which lowers subscriber conversion rates.[312]

Google has responded to this concern by noting that AMP does not prevent publishers from placing ads on AMP pages, but restricting the number of ads "leads to improved page load times, increased site traffic, superior ad engagement, and thus typically increases advertising revenue overall."[313] Google also said in its responses to Subcommittee Chairman Cicilline's questions for the record that it "does not privilege publishers who use AMP over publishers that adopt non-Google technical solutions that would also guarantee fast-loading pages."[314]

Finally, because news is often accessed online through channels other than the original publication—including search results, voice assistants, social platforms, or news aggregators—journalism has increasingly become "atomized" or removed from its source and placed alongside other content.[315] In the context of audio news, one market participant noted that aggregating different news sources can create a bad experience for users.[316] The aggregation of different news sources without editorial oversight can also cause reputational harm to news publishers, such as when highly credible reporting appears alongside an opinion-based news source.[317]

Indirectly, the atomization of news may increase the likelihood that people are exposed to disinformation or untrustworthy sources of news online. When online news is disintermediated from its source, people generally have more difficulty discerning the credibility of reporting online. This

317 Interview with Source 114 (Oct. 2, 2019).

process may also "foster ambivalence about the quality and nature of content that garners users' attention," particularly among young people.[318]

For example, during the Subcommittee's sixth hearing, Subcommittee Chairman David N. Cicilline presented Facebook CEO Mark Zuckerberg with evidence of a Breitbart video that claimed that "you don't need a mask and hydroxychloroquine is a cure for COVID."[319] As he noted, within the first five hours of this video being posted, it had nearly "20 million views and over 100,000 comments before Facebook acted to remove it."[320] Mr. Zuckerberg responded that "a lot of people shared that, and we did take it down because it violate[d] our policies."[321] In response, Chairman Cicilline asked if "20 million people saw it over the period of five hours . . . doesn't that suggest, Mr. Zuckerberg, that your platform is so big that, even with the right policies in place, you can't contain deadly content?"[322] Mr. Zuckerberg responded by claiming that Facebook has a "relatively good track record of finding and taking down lots of false content."[323]

Moreover, because there is not meaningful competition, dominant firms face little financial consequence when misinformation and propaganda are promoted online.[324] Platforms that are dependent on online advertising have an incentive to prioritize content that is addictive or exploitative to increase engagement on the platform.[325] And the reliance on platforms by advertisers has generally diminished their ability to push for improvements in content standards. As a news publisher explained in a submission to the Subcommittee:

> As advertisers have become more reliant on dominant search and social platforms to reach potential consumers, they have lost any leverage to demand change in the policies or practices of the platforms. In the era of newspapers, television, radio, or indeed direct sales of digital advertising online, there was a connection between advertising and the

[325] Conversely, the decline of trustworthy sources of news due to rising market power and declining ad revenue has also contributed to this harm. Competition & Mkts Auth. Report at 9 ("[C]oncerns relating to online platforms funded by digital advertising can lead to wider social, political and cultural harm through the decline of authoritative and reliable news media, the resultant spread of 'fake news' and the decline of the local press which is often a significant force in sustaining communities.").

content it funds, creating a high degree of accountability for both parties in that transaction. This maintained high content standards, and enabled advertisers to demand or pursue change from publishers whose content standards fell. While many high-quality publishers continue to operate stringent policies in relation to the digital advertising that they permit to appear within their services, in a world of programmatic audience trading that self-regulated compact between advertisers and platform does not exist.[326]

During the Subcommittee's sixth hearing, Representative Jamie Raskin (D-MD) raised this concern. As he noted, in July 2020, Facebook faced an advertiser boycott by hundreds of companies.[327] This effort, which has been spearheaded by the Stop Hate for Profit campaign, a coalition of civil rights groups organizing in protest of "the rapid spread of hate messages online, the presence of boogaloo and other right-wing extremist groups trying to infiltrate and disrupt Black Lives Matter protests and the fact that alt-right racists and anti-Semitic content flourishes on Facebook."[328]

As a result of this campaign, more than a thousand major companies—including Disney, Coca-Cola, and General Motors—announced that they would pull $7 billion in advertisements on Facebook as part of the Stop Hate for Profit boycott.[329] But as Representative Raskin pointed out during the hearing Facebook does not "seem to be that moved by their campaign."[330]

Representative Pramila Jayapal (D-WA) also noted during the hearing that Mr. Zuckerberg reportedly told Facebook's employees at an internal meeting that the company is "not gonna change our policies or approach on anything because of a threat to a small percent of our revenue, or to any percent of our revenue."[331] During that meeting, Mr. Zuckerberg reportedly acknowledged that the boycott "hurts us reputationally," but said that the company was insulated from threats by large advertisers due to advertising revenue from small businesses.[332] In response to this report, Ms. Jayapal asked Mr. Zuckerberg whether Facebook is "so big that you don't care how you're impacted by a

major boycott of 1,100 advertisers?"[333] Mr. Zuckerberg responded that "[o]f course we care. But we're also not going to set our content policies because of advertisers. I think that that would be the wrong thing for us to do."[334]

Since then, the civil rights groups have said that although Facebook made some changes in response to the boycott—such as the creation of a position within the company dedicated to overseeing civil rights and algorithmic bias—it ultimately has not made meaningful changes at scale, and "lags competitors in working systematically to address hate and bigotry on their platform."[335]

The group organized further action in September 2020, when it called for companies and public figures to stop posting on Instagram beginning September 16th.[336] This protest, aimed again at Facebook's treatment of hate groups, was spurred by the police shooting of Jacob Blake in Kenosha, Wisconsin.[337] In the aftermath, Facebook failed to remove a group promoting the coalescence of an armed militia in the streets of Kenosha, despite numerous users reporting the page.[338] Mr. Zuckerberg called this failure an "operational mistake."[339]

ii. Monetization

The rise of market power online has severely affected the monetization of news, diminishing the ability of publishers to deliver valuable reporting.[340]

The digital advertising market is highly concentrated, with Google and Facebook controlling the majority of the online advertising market in the United States,[341] capturing nearly all of its growth

in recent years.[342] Although Amazon has grown its digital advertising business to become the third largest competitor in the market,[343] it still accounts for a relatively small percentage.[344]

News publishers have raised concerns that this significant level of concentration in the online advertising market—commonly referred to as the digital ad duopoly—has harmed the quality and availability of journalism.[345] They note that as a result of this dominance, there has been a significant decline in advertising revenue to news publishers,[346] undermining publishers' ability to deliver valuable reporting, and "siphon[ing] revenue away from news organizations."[347]

Jason Kint, the CEO of Digital Content Next, a trade association that represents both digital and traditional news publishers, notes that there is "a clear correlation between layoffs and buyouts with the growth in market share for the duopoly—Google and Facebook."[348] David Chavern, the President and CEO of the News Media Alliance, has likewise said that "[t]he problem is that today's internet distribution systems distort the flow of economic value derived from good reporting."[349] The effects of this revenue decline are most severe at the local level, where the decimation of local news sources is giving rise to local news deserts.[350]

Other news publishers have expressed concerns about the dual role of platforms as both intermediaries and platforms for people's attention.[351] By keeping people inside a "walled garden," platforms can monetize their attention through ads, creating a strong economic incentive to minimize

outbound referrals that lead to a decline in users' attention and engagement. In turn, this diminishes the incentives of publishers to invest in high-quality journalism.[352] David Pitofsky, the General Counsel of NewsCorp, described this as a free-riding problem in his testimony before the Subcommittee, explaining that platforms:

> [D]eploy our highly engaging news content to target our audiences, then turn around and sell that audience engagement to the same advertisers news publishers are trying to serve. Dominant platforms take the overwhelming majority of advertising revenue without making any investment in the production of the news, all while foreswearing any responsibility for its quality and accuracy. As a result, one of the pillars of the news industry's business model, advertising revenue, is crumbling.[353]

c. International Scrutiny

Several of the concerns regarding the distribution and monetization of news through platform intermediaries were raised as part of a comprehensive inquiry by the Australian Competition and Consumer Commission (ACCC). Over the span of several years, the Commission collected evidence from more than a hundred market participants and organizations as part of its review. Following its publication of a Preliminary Report in December 2018 and an Issues Paper in February 2018, the ACCC issued an extensive Final Report spanning more than 600 pages and including submissions from more than 100 market participants.[354]

Among its findings, the ACCC concluded that Facebook and Google have significant and durable market power over the distribution of news online.[355] As the ACCC noted, "Google and Facebook are the gateways to online news media for many consumers," accounting for a significant amount of referral traffic to news publishers' websites.[356] As a result, news publishers are reliant on these platforms for reaching people online, which affects publishers' ability to monetize journalism, particularly on formats such as Google's Accelerated Mobile Pages (AMP).[357]

356 *Id.* at 296.

357 *Id.* at 206, 247 (concluding that AMP is a "must have" product for publishers).

The ACCC made 23 recommendations to address concerns across a broad range of issues, including antitrust, privacy, and consumer protection.[358] Within the context of addressing the effects of market power on the news industry—particularly as it relates to the imbalance of bargaining power between platforms and publishers—the Commission recommended developing "a code of conduct to govern the relationship between media businesses and digital platforms [which] seeks, among other things, to address this imbalance."[359]

On July 31, 2020, the Commission released a draft code to address a "fundamental bargaining power imbalance" between news publishers and dominant platforms that has led to "news media businesses accepting less favourable terms for the inclusion of news on digital platform services than they would otherwise agree to in response to a request by the Australian government."[360]

Under this code, Facebook, Google, and other platforms with significant bargaining power designated by Australia's Treasurer must negotiate with covered news publishers "in good faith over all issues relevant to news on digital platform services."[361] News publishers may negotiate either individually or collectively over a three-month period, allowing local and rural publishers "to negotiate from a stronger position than negotiating individually."[362]

If publishers are unable to reach an agreement during the mediated negotiation period, they may bring the dispute to compulsory arbitration. As part of this process, the arbitrator must consider the parties' final offers covering: (1) the benefits of news content to the platform; (2) the costs of producing news by the publisher; and (3) whether a payment model would unduly burden the commercial interests of the platform.[363] The arbitrator must choose one of the parties' proposals, encouraging both parties to make reasonable offers.[364]

Facebook and Google have responded to the draft code by warning that they may no longer display news on their respective platforms in Australia. Despite an "unprecedented surge in audiences

for news websites and TV news,"[365] Google claims that the draft code does not reflect the "more than $200 million in value that Google provides to publishers each year by sending people to their websites."[366] Facebook described the draft code as "unprecedented in its reach," notwithstanding similar proposals in other countries, including France,[367] as well as the United States.[368]

In response to Google's threat to boycott journalism in Australia, ACCC Chair Rod Sims said that Google's statement contained "misinformation" about the draft code, asserting that the draft code responds to "a significant bargaining power imbalance between Australian news media businesses and Google and Facebook."[369] Australia's Treasurer, Josh Frydenberg, similarly said that the country would not "respond to coercion or heavy-handed threats wherever they come from."[370]

4. Political and Economic Liberty

During the investigation, the Subcommittee examined the effects of market power on political and economic liberty. Concerns about the democratic effects of private monopolies trace back to the foundational antitrust statutes, where lawmakers worried that monopolies were "a menace to republican institutions themselves."[371] The Subcommittee's examination of these matters follows a long tradition of congressional attention to this issue.[372]

[371] 21 CONG. REC. 3146 (1890) (statement of Sen. Hoar).

[372] *Id*. at 2459 (statement of Sen Sherman); *see* 95 CONG. REC. 11486 (statement of Rep. Celler) ("[B]usiness concentration is politically dangerous, leading inevitably to increasing Government control."); also 96 CONG. REC. 16,452 (1950) (statement of Rep. Kefauver) ("[T]he history of what has taken place in other nations where mergers and concentrations have placed economic control in the hands of a very few people is too clear to pass over easily. A point is eventually reached, and we are rapidly reaching that point in this country, where the public steps in to take over when concentration and monopoly gain too much power. The taking over by the public through its government always follows one or two methods and has one or two political results. It either results in a Fascist state or the nationalization of industries and thereafter a Socialist or Communist state.").

Based on interviews and submissions from market participants, along with other evidence examined by the Subcommittee, there are several ways in which the market power of the dominant platforms affects political and economic power.

First, the Subcommittee encountered a prevalence of fear among market participants who depend on the dominant platforms. Repeatedly, market participants expressed deep concern that speaking about the dominant platforms' business practices—even confidentially without attribution—would lead a platform to retaliate against them, with severe financial repercussions. The source of this fear was twofold. Some firms were so dependent on the platform that even potentially risking retaliation caused alarm. Others had previously seen a platform retaliate against someone for raising public concerns about their business practices and wanted to avoid the same fate.

Several market participants told the Subcommittee that they "live in fear" of the platforms. One said, "It would be commercial suicide to be in Amazon's crosshairs . . . If Amazon saw us criticizing, I have no doubt they would remove our access and destroy our business."[373] Another told the Subcommittee, "Given how powerful Google is and their past actions, we are also quite frankly worried about retaliation."[374] An attorney representing app developers said they "fear retaliation by Apple" and are "worried that their private communications are being monitored, so they won't speak out against abusive and discriminatory behavior."[375]

Market participants also expressed unease about the success of their business and their economic livelihood depending on the decision-making of the platforms. A single tweak of an algorithm, intentional or not, could cause significant costs if not financial disaster—with little recourse. Market participants routinely characterized the platforms as having arbitrary and unaccountable power—the same forms of undue power that antitrust laws were designed to prevent. As Senator John Sherman (R-OH) explained, antitrust was essential to preserve liberty "at the foundation of the equality of all rights and privileges" because concentrations of power outside of democratic institutions were a "kingly prerogative, inconsistent with our form of government."[376]

Additionally, courts and regulators have found that several of the dominant platforms have engaged in recidivism. For example, Facebook settled charges brought in 2012 by the Federal Trade Commission (FTC) that it had "deceived consumers by telling them they could keep their information on Facebook private, and then repeatedly allowing it to be shared and made public."[377] As part of this

settlement, Facebook agreed to abide by an administrative order requiring that Facebook not misrepresent its privacy protections.[378] Seven years later, the FTC concluded that Facebook had almost immediately begun violating that order following its adoption.[379] Ruling on the FTC's subsequent settlement with Facebook, District Court Judge Timothy Kelley wrote that "the unscrupulous way in which the United States alleges Facebook violated both the law and the administrative order is stunning."[380] The FTC has similarly sanctioned Google on several occasions for privacy violations.[381] In 2010, Apple settled charges it had entered into no-poach agreements with six other technology companies.[382] Two years later, Apple was found guilty of orchestrating a price-fixing conspiracy.[383] In that case, the presiding judge stated that the record "demonstrated a blatant and aggressive disregard" by Apple "for the requirements of the law," noting that the conduct "included Apple lawyers and its highest level executives."[384]

Lastly, the growth in the platforms' market power has coincided with an increase in their influence over the policymaking process. Over the past decade, the dominant online platforms have significantly increased their lobbying activity,[385] which tends to create a feedback loop for large

This is a trend for the industry. The total reported lobbying expenditures by digital platforms increased from $1,190,000 a year in 1998, to $74,285,000 in 2019 as the industry consolidated and gained market power. LOBBYING SPENDING DATABASE, CTR. FOR RESPONSIVE POLITICS, https://www.opensecrets.org/lobby/top.php?indexType=i&showYear=2019 (last visited on Sept. 27, 2020).

companies. More money spent on lobbying may deliver higher equity returns and market share,[386] which, in turn, may spur more lobbying.

Outside of traditionally reported and regulated lobbying, firms with market power and dispensable income fund think tanks and nonprofit advocacy groups to steer policy discussion. For example, Facebook, Google, and Amazon reportedly donated significant amounts to the American Enterprise Institute (AEI), which, in turn, has argued that antitrust critiques of the big platforms are "astonishingly weak."[387] More recently, Google and Amazon have contributed significant funding to the Global Antitrust Institute at the George Mason University's Antonin Scalia School of Law, which advocates against antitrust scrutiny of the dominant platforms.[388] By funding academics and advocacy groups, the dominant platforms can expand their sphere of influence, further shaping how they are governed and regulated.

At several hearings, Members of the Subcommittee noted that the outsized political influence of dominant firms has adverse effects on the democratic process. At the Subcommittee's field hearing in Colorado, Representative Ken Buck (R-CO) asked each of the witnesses about this issue.[389] As Representative Buck noted, the dominant platforms are generally well represented in the policymaking process:

> Part of what we are dealing with here is the reality that [dominant firms] walk into our offices and they tell us their side of the story and we very rarely hear the other side of the story, and somehow part of this solution has to be that public policymakers elected, appointed, have to have access to that kind of information. So I thank you for being here and I also would encourage you to make sure that, you know, we are accessible. We are trying our best to make sure that we continue to create the environment for your kinds of companies.[390]

During the Subcommittee's sixth hearing, Subcommittee Chairman David N. Cicilline (D-RI) noted the democratic stakes of the Subcommittee's work. He said, "Because concentrated economic power

also leads to concentrated political power, this investigation also goes to the heart of whether we, as a people, govern ourselves, or whether we let ourselves be governed by private monopolies."[391]

IV. MARKETS INVESTIGATED

A. Online Search

Online search engines enable users to retrieve webpages and information stored on the Internet. After a user enters a query into the search engine, the search provider returns a list of webpages and information that are relevant to the search term entered.

There are two types of search engines: horizontal and vertical. Horizontal search engines are designed to retrieve a comprehensive list of general search results. Vertical search engines are designed to retrieve a narrower category of content, such as photo images (e.g., Dreamstime) or travel (e.g., Expedia). The majority of general search engines monetize the service through selling ad placements rather than charging search users a monetary price. The overwhelmingly dominant provider of general online search is Google, which captures around 81% of all general search queries in the U.S. on desktop and 94% on mobile. Other search providers include Bing, which captures 6% of the market, Yahoo (3%), and DuckDuckGo (1%).[392]

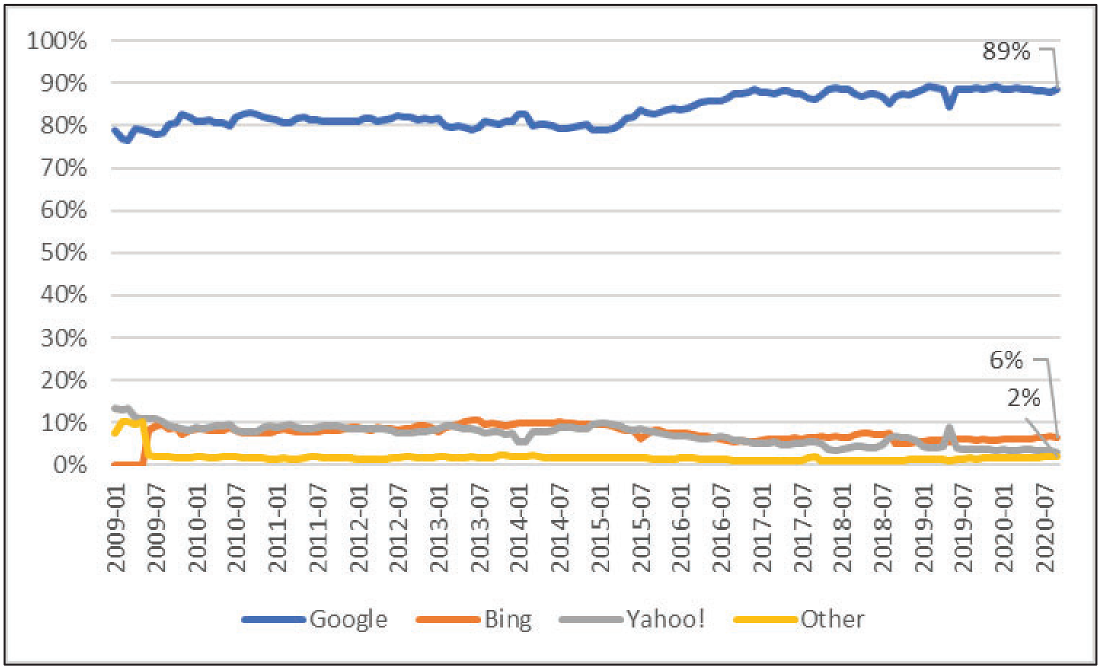
[392] *Search Engine Market Share United States of America: Sept. 2019–Sept. 2020*, STATCOUNTER, http://gs.statcounter.com/search-engine-market-share/all/united-states-of-america (last visited Oct. 3, 2020).

U.S. Desktop and Mobile Search Market Share[393]



Online search is comprised of three distinct activities. First, an engine must "crawl" the Internet by using an automated bot to collect copies of all of the webpages it can find. Once a crawler has recorded all of this material, it must be collated and organized into an "index," or a map of the Internet that can be searched in real-time. Indexing organizes the information into the formats and databases required for the querying function. When a user enters a query into the search engine, the engine draws from the index to pull a list of responsive websites, ordered in terms of relevance. The relevance, in turn, is determined by the search algorithm applied by the search engine. A search engine can function only if it has access to an index, and an index can exist only once web pages have been crawled and collated into a repository.[394] Indexing has high fixed costs and requires significant server storage and

[393] Prepared by the Subcomm. based on *Desktop & Mobile Search Engine Market Share United States Of America, January 2009 to September 2020,* STATCOUNTER https://gs.statcounter.com/search-engine-market-share/desktop-mobile/united-states-of-america/#monthly-200901-202009. The "Other" category includes AOL, Ask Jeeves, DuckDuckGo, MSN, Webcrawler, Windows Live, AVG Search, Baidu, Comcast, Babylon, Dogpile, Earthlink, Norton Safe Search, and YANDEX RU. *Id.*

[394] Submission from Source 531, to H. Comm. on the Judiciary, Source 531-000017 (Nov. 21, 2011) (on file with Comm.) According to one market participant, "[t]he greatest challenges in building a search index are finding the URLs for documents stored on the Web and then being able to parse the best URLs and documents to include in the index. Overcoming these challenges requires massive amounts of data on user interactions with websites to discover new URLs and then filter down to the 5% of known URLs [the search engine] uses to determine which documents to index, and how frequently these documents should be refreshed."

compute power.[395] The ability to invest heavily in computing power and storage yields a significant advantage.[396]

Several online search features tilt the market towards the dominant incumbent and make entry by new market participants difficult. First, web crawling is costly and strongly favors first-movers.[397] In a submission to the Subcommittee, one expert described how Google's early efforts have locked in its dominance.[398] In particular, Google was the first company to crawl the entirety of the Internet, a feat motivated in part due to its PageRank algorithm, which used links between pages to identify the most relevant webpages for specific topics and queries. Unlike most search engine algorithms at the time, the quality of PageRank results improved with more webpages, incentivizing Google to crawl a greater portion of the web.

The web has grown exponentially over the last two decades, [399] which means the cost of crawling the entire Internet has increased too, despite advances in crawling technology. Today several major webpage owners block all but a select few crawlers, in part because being constantly crawled by a large number of bots can hike costs for owners and lead their webpages to crash. The one crawler that nearly all webpages will allow is Google's "Googlebot," as disappearing from Google's index would lead most webpages to suffer dramatic drops in traffic and revenue.[400] Any new search engine crawler, by contrast, would likely be blocked by major webpage owners unless that search engine was driving significant traffic to webpages—which a search engine cannot do until it has crawled enough webpages.[401]

[401] Submission from Submission from Zack Maril, to H. Comm. on the Judiciary (Sept. 30, 2019) (on file with Comm.).

The high cost of maintaining a fresh index and the decision by many large webpages to block most crawlers significantly limits new search engine entrants. In 2018, Findx—a privacy-oriented search engine that had attempted to build its own index—shut down its crawler, citing the impossibility of building a comprehensive search index when many large websites only permit crawlers from Google and Bing.[402] Today the only English-language search engines that maintain their own comprehensive webpage index are Google and Bing.[403] Other search engines—including Yahoo and DuckDuckGo—must purchase access to the index from Google and/or Bing through syndication agreements that provide syndicated search engines with access to search results and search advertising.[404] While Yahoo previously maintained an independent index, it entered a deal with Microsoft in 2009 to integrate search technologies—a move driven by the two firms' belief that combining was necessary to provide a real alternative to Google.[405]

A second major competitive advantage enjoyed by search engine incumbents is their access to voluminous click-and-query data. This data, which tracks what users searched for and how they interacted with the search results, benefits search engines in several key ways.[406] First, search engines rely on click-and-query data to guide their search index's upkeep, as this data helps identify which webpages are most relevant and should be most regularly updated in the index.[407] Second, click-and-query-data is used to refine the search algorithm and the relevance of search results, as past user interactions improve the algorithm's ability to predict future interactions.[408] In particular, data on "tail"

---

[402] Findx, *Game over* (Sept. 21, 2019), https://web.archive.org/web/20190921180535/https://privacore.github.io ("Many large websites like LinkedIn, Yelp, Quora, Github, Facebook and others only allow certain specific crawlers like Google and Bing to include their webpages in a search engine index. . . . That meant that the Findx search index was incomplete and was not able to return results that were likely both relevant and good quality. When you compare any independent search engine's results to Google for example, they have no chance to be as relevant or complete because many large websites refuse to allow any other search engine to include their pages."); Submission from Source 407, to H. [407] Submission from Source 26, to H. Comm. on the Judiciary, Source 26-000016 (Nov. 21, 2011) (on file with Comm.) ("Queries are a critical component of the user data necessary to identify and rank URLs and documents for inclusion in a search index. Fewer queries mean fewer opportunities to identify relevant URLs and documents, which ultimately means a smaller usable search index."); rep-000026 (Nov. 21, 2011) ("Index freshness also is an important factor in the quality of a search engine's result . . . A [] survey found that a lack of freshness was a significant driver of dissatisfaction among users searching in the Entertainment and News categories.").

[408] *Id.* at Source 531-000015 ("The more user queries the search engine handles, the more data it obtains to improve the relevance of the search results it serves."); Source 531-000060 ("The secret to successful algorithmic search matching algorithms is user feedback . . . Ultimately this feedback helps the engine improve core relevance and other experience factors—driving higher engagement."); Innovation and Entrepreneurship Hearing at 3 (statement of Megan Gray, Gen.

(or rare) queries enable a search engine to offer relevant results across a higher set of potential queries—improving the overall quality of the search engine—and Google's internal documents show that the company recognizes its long-tail advantage.[409] And third, increased query scale increases advertiser engagement rates, given that more user queries generally translate to more advertisement clicks, generating greater revenue for advertisers.[410]

Overall there are significant advantages to scale in click-and-query data, though the marginal benefit of additional data on tail queries is higher than the marginal benefit of additional data on "head" (or relatively common) queries.[411] Some market participants also stated that the benefits of scale diminish once a search engine reaches a certain size.[412] The benefits of scale create a feedback loop, where access to greater click-and-query data improves search quality, which drives more usage and generates additional click-and-query data.

A third barrier to competition in general online search is that Google has established extensive default positions across both browsers and mobile devices. Among desktop browsers, Google enjoys default placement in Chrome (which captures 51% of the U.S. market), Safari (31%), and Firefox (5%)—or 87% of the browser market.[413] Meanwhile, Microsoft's Edge, which captures 4% of the desktop browser market, sets Bing as its search default, leaving little opening for independent search

---

Counsel & Pol'y Advocate, DuckDuckGo) ("Another barrier facing a start-up search engine is that it needs data, such as the most commonly clicked links for a particular query, in order to produce a useful ranking of organic links, i.e., what organic link is first, second, etc."); Submission from Source 209, to H. Comm. on the Judiciary, Source 209-0000346–52 (Aug. 24, 2009) (on file with Comm.) engines.[414] In mobile, Google Search is primarily the default on Android and on Apple's iOS mobile operating system—together Android and iOS account for over 99% of smartphones in the United States.[415] This default position provides Google with a significant advantage over other search engines, given users' tendency to stick with the default choice presented. Moreover, market participants identified several ways Google dissuades even those users who do attempt to switch default search engines on Chrome.[416]

Google won itself default placement across the mobile and desktop ecosystem through both integration and contractual arrangements. By owning Android, the world's most popular mobile operating system, Google ensured that Google Search remained dominant even as mobile replaced desktop as the critical entry point to the Internet. Documents submitted to the Subcommittee show that at certain key moments, Google conditioned access to the Google Play Store on making Google Search the default search engine, a requirement that gave Google a significant advantage over competing search engines.[417] Through revenue-sharing agreements amounting to billions of dollars in annual payments, Google also established default positions on Apple's Safari browser (on both desktop and mobile) and Mozilla's Firefox.[418]

In public statements, Google has downplayed the significance of default placement, claiming that "competition is just a click away."[419] However, Google's internal documents show that when Google was still jostling for search market share, Google executives closely tracked search defaults on Microsoft's Internet Explorer and expressed concern that non-Google defaults could impede Google Search.[420] In an internal presentation about Internet Explorer's default search selection, Google recommended that users be given an initial opportunity to select a search engine and that browsers minimize the steps required to change the default search engine.[421] These discussions—along with the steep sums Google pays Apple and various browsers for default search placement—further highlight the competitive significance of default positions.

[420] *See, e.g.*, Production of Google, to H. Comm. on the Judiciary, GOOG-HJC-01196214 (May 31, 2005) (on file with Comm.).

[421] Production of Google, to H. Comm. on the Judiciary, GOOG-HJC-01680749 (February 16, 2006) (on file with Comm.) (identifying several recommendations, including, "[f]ewest clicks required to change default, which promotes search innovation by facilitating the user's ability to switch.").

Independent search engines told the Subcommittee that because they are not set as the default search engine on popular browsers, they face significant business challenges. As a result, DuckDuckGo said it was compelled to invest in browser technology, including creating its own browser for Android and iOS and various browser extensions.[422] It noted, however, that "the same default placement challenges exist in the browser market, just one level up – with the device makers requiring millions or billions of dollars to become a default browser on a device."[423]

A fourth challenge facing upstart search engines is the growing number of features and services that a general search provider must offer to be competitive with Google. Through the mid-2000s, a general search engine could compete through providing organic links alone. Since Google and Bing now incorporate information boxes and various specialized services directly onto their general search results page, a market entrant would similarly need to provide a broader set of search features and services. One market participant told the Subcommittee that this set of "mandatory high-quality search features" includes maps, local business answers, news, images, videos, definitions, and "quick answers."[424] Delivering this variety of features requires access to various sources of data, raising the overall costs of entry.

Vertical search providers differ from horizontal search engines in several ways. By offering specialized search focused on a particular topic or activity, they fulfill a separate role and require distinct tools and expertise. The necessary inputs vary by search vertical. Flight search, for example, requires access to flight software and data, whereas certain local search providers rely on user-generated content such as reviews. Many vertical providers use structured data feeds that pull from third-party databases, rather than from a general index.

A significant challenge for vertical providers is reaching users. Although they serve distinct needs, most vertical search providers still depend on horizontal search engines—and specifically on Google—to reach users.[425] In submissions to the Subcommittee, even some of the largest and most well-known verticals stated that they depend on Google for up to 80–95% of their traffic.[426] Since Google now also provides vertical search services, it has the incentive and ability to use its dominance in horizontal search to disfavor vertical providers that compete with its own vertical search services. Internal documents from Google show that it has used its dominance in general search to closely track

traffic to competing verticals, demanding that certain verticals permit Google to scrape their user-generated content and demote several verticals. Several market participants told the Subcommittee that Google's preferential treatment of its own verticals, as well as its direct listing of information in the "OneBox" that appears at the top of Google search results, has the net effect of diverting traffic from competing verticals and jeopardizing the health and viability of their business.[427]

Google's internal documents and submissions from third-party market participants suggest that verticals are both a complement to horizontal search as well as a competitive threat to it. One market participant explained that while vertical search providers can increase demand for horizontal search engines in the short-term, they can divert traffic from horizontal search providers in the long-term, as the growing popularity of a vertical may lead users to navigate to it directly.[428] Diverting traffic from general search providers, in turn, would deprive them of both advertiser revenue as well as valuable click-and-query data. Given these dynamics, a dominant horizontal search provider that also enters vertical search faces a significant conflict of interest that can skew search results to the detriment of third-party businesses and users alike.

B. Online Commerce

Online commerce, also known as e-commerce, is the activity of buying or selling products or services using the Internet.[429] E-commerce transactions take place through a variety of channels, including online marketplaces like Amazon Marketplace, where a wide variety of brands and products from different sellers are sold in one place, or a business's direct to consumer website like Nike.com. In 2019, the U.S. Census Bureau estimated e-commerce retail sales to be about $600 billion,[430] compared to just under $33 billion in 2001.[431] As the COVID-19 pandemic pushes more American shoppers online, e-commerce growth has exploded.[432] This is particularly true for online marketplaces,

where sales for essential items like groceries, masks, and electronics for home offices increased sharply in the wake of the pandemic.[433]

An online marketplace's most basic function is to serve as a platform that connects buyers and sellers. Marketplaces include product listings from a variety of sellers. Some online marketplaces, such as Amazon and eBay, aim to be fully integrated, multi-category e-commerce sites. Other marketplaces, however, operate as vertical, single-category sites, such as Newegg.com, for computer hardware and consumer electronics. The primary customers of e-commerce marketplaces are customers looking to buy an item or service online, and businesses looking to sell goods or services to customers online. Because of this, a successful marketplace must be attractive to consumers and third-party sellers.

The consumer-facing side of the marketplace allows users to search for and purchase products. Most online marketplaces offer features that enable users to compare competing products based on details like their price, popularity, and customer satisfaction reviews. Amazon is by far the largest marketplace.[434] Other marketplaces that are popular with consumers include eBay, Walmart, and Wayfair.[435]

Online marketplaces also serve third-party sellers. Third-party sellers have needs that are distinct from consumers visiting the marketplace to make a purchase. The seller-facing side of the business consists of providing third-party sellers with a platform to list their products for consumers to purchase. Often, the marketplace will supply vendors with services such as inventory tracking and pricing recommendations. Online marketplaces usually offer additional paid services to third-party sellers such as advertising and fulfillment services, consisting of warehousing, packing, and shipping.

The businesses that own and operate e-commerce marketplaces may host only independent, third-party seller listings, or list their own items for sale alongside third-party sellers. Amazon

[435] ANDREW LIPSMAN, EMARKETER, TOP 10 US ECOMMERCE COMPANIES 2020 (Mar. 10, 2020), https://www.emarketer.com/content/top-10-us-ecommerce-companies-2020.

Marketplace is an example of the latter, in that customers view Amazon Retail offers for its own private-label brands, such as AmazonBasics,[436] alongside independent, third-party seller offers. Amazon Retail also acts as a reseller of brand-name items, purchasing items like Levi's jeans from a wholesaler, and then reselling them on the marketplace. In these circumstances, third-party sellers are both customers and competitors of online marketplaces.

Marketplace operators benefit financially from the sale of services to third-party sellers and consumers.[437] On the seller-facing side of their business, marketplaces usually take a cut of third-party sales and charge fees for sales-related services like fulfillment, payment, and advertising. If the marketplace operators also sell products on their own platforms, they make money like a typical retailer from the difference between the wholesale and retail price. Marketplaces may also make money from fees paid by customers to participate in membership programs. For example, Amazon offers Amazon Prime for $119 per year as a paid membership program that provides customers with benefits such as unlimited free shipping on eligible items and digital streaming video.[438] Other revenue sources for marketplaces may include credit card and gift card services that are tied to the platform.[439]

A few large companies dominate the e-commerce industry, and Amazon is the clear leader among them. The market research company eMarketer estimates that Amazon is about eight times larger than eBay and Walmart in terms of market share.[440] Other metrics further demonstrate Amazon's role as a gatekeeper for e-commerce. Amazon is the most-visited website globally for e-commerce and shopping,[441] and recent analyses suggest that over 60% of all online product searches in the U.S. begin on Amazon.com.[442]

Amazon's dominance in e-commerce extends to its role as a marketplace operator and its relationship with sellers. Because of its size and scale, no other marketplace comes close to providing sellers with access to such a large pool of buyers, as well as sales-related services. There are over 112 million Prime members in the United States—about 44% of the adult population. The number of Prime members has doubled since reaching 50 million members in 2015, with Amazon projecting additional growth.[443] Amazon.com has 2.3 million active sellers on its marketplace worldwide.[444] In comparison, Amazon's closest e-commerce competitor, Walmart, has roughly 54,000 sellers on its marketplace.[445] In general, the more sellers a platform has, the more buyers it can attract and vice versa.[446] According to a competing online marketplace, sellers feel forced to be on Amazon because that is where the buyers are.[447]

If current trends continue, no company is likely to pose a threat to Amazon's dominance in the near or distant future. Although some alternatives to Amazon have experienced growth during the pandemic, there is still a massive gap between the market leader and its competitors.[448] Several factors privilege Amazon as the dominant e-commerce marketplace, and also make entry or expansion by a challenger unlikely. While some of these barriers to entry are inherent to e-commerce—such as economies of scale and network effects—others result from Amazon's anticompetitive conduct. As discussed elsewhere in the Report, Amazon's acquisition strategy and many of its business practices were successfully designed to protect and expand its market power. An Amazon executive referred to some of these tactics as the company's "Big Moats," and suggested "doubl[ing] down" on them in a business strategy document.[449] Similarly, in 2018, an investment analyst report expressed skepticism

about Walmart's ability to challenge Amazon, commenting, "[W]e are concerned Amazon's Prime membership program is fortifying an impenetrable moat around its customers."[450]

C. Social Networks and Social Media

Social media products and services include social networking, messaging, and media platforms designed to engage people by facilitating sharing, creating, and communicating content and information online.[451] Although the boundaries of the social media market are imprecise,[452] social media platforms generally allow users on their networks to interact with people or groups they know, display content through linear feeds, or otherwise add socially layered functionality for services online, usually through a mobile app. In response to the Committee's requests for information, several market participants said they view social media as driven by networks, while many social media products and services include common functionalities, such as public profiles, curated feeds, followers, messaging, and other use cases.[453] Others focus on certain aspects of public and private communications.[454]

A principal feature of social media platforms is that they typically offer their services for a zero monetary price to the platform's users.[455] The platform develops a service it hopes will attract a critical mass of users to then attract advertisers to the platform.[456] Some social media companies offer additional services to users for a price or allow users to pay for additional functionality. For example, LinkedIn Premium provides users with an option to pay for additional features, such as their network and in-app messaging insights.[457]

[457] LINKEDIN PREMIUM, https://premium.linkedin.com/ (last visited Oct. 3, 2020).

Social media platforms with a larger network of users are more likely to attract users and advertisers.[458] In a briefing to Subcommittee members and staff, Brad Smith, the President of Microsoft, described this value:

> You don't always need to have a proven business model to attract capital. You just need an idea that will get a lot of users. And then people assume you'll find a way to turn that usage into a business model that will produce revenue. That's been very important for the US. It distinguishes us and allows venture funding. There's something magical about 100 million active monthly users (MAU) in the United States. At that level a company becomes a force unto themselves. If you see a company acquire another company that's in the same product market and is on the path to reach 100 million MAU, that's more likely to raise a competitive concern. Historically, I think regulators were slow to notice that issue.[459]

As another market participant describes it, "attracting a critical mass of users is essential to delivering a viable social network, as there is no reason for users to start using a social network if there is no one there with whom they can connect."[460]

Social media companies may also focus on attracting particular types or groups of consumers to differentiate themselves from larger companies.[461] Many of the top-ranking apps on iOS are complementary to popular social media applications. For example, Dazz Cam, a vintage-inspired photo-editing app used with TikTok, was popular in the U.S. in 2020.[462] Similarly, Lens is a popular iOS app that allows users to browse, like, and comment on photos and videos on Instagram using the Apple Watch.[463]

Due to network effects in the social media market, new entrants may choose to begin as a complement by relying on the incumbent platform's application programming interfaces (APIs) such as Facebook's Open Graph or Twitter's search API.[464] However, because incumbent platforms control access to these APIs and can foreclose access to a complementary app that is successful or gaining users,[465] some market participants view relying on these platforms to reach users as a constant business risk.[466] One market participant noted that in addition to harming their business, these actions also "restrict users' ability to multi-home and increase barriers to entry, including network effects and switching costs."[467]

Given Facebook's dominance, the primary way for new entrants to compete is to attract a subgroup or niche.[468] One market participant explained, "competitors may be limited to niche strategies that do not challenge the incumbent directly. For example, Facebook (including Instagram) is by far the most popular social networking platform. Although there are several competitors, such as LinkedIn, and fast-growing new entrants, such as TikTok, most or all employ niche strategies to varying degrees, and most have far less user engagement, attention, and data and a smaller share of advertising revenue than Facebook."[469]

1. <u>Social Networks are Distinguishable from Social Media</u>

While a broad view of the social media market is useful for considering the wider landscape for social data and online advertising,[470] it is important to focus on the actual use, demand, and substitutability of social products when examining competition among social platforms online.[471] The critical distinction between social networking and social media markets is how people use the

Report at 117–18 ("[T]he closeness of competition between different platforms depends on the degree to which consumers consider them substitutes, rather than the extent to which they share common functionalities.").

platform. As Germany's Federal Cartel Office (Bundeskartellamt) and the United Kingdom's Competition and Markets Authority (CMA) have noted, the specific demand for social networks "is fundamentally different from the demand for other social media."[472]

Social network platforms facilitate their users finding, interacting, and networking with other people they already know online, and by providing a "rich social experience" through features on their products.[473] People regularly use social network platforms to exchange "experiences, opinions and contents among specific contacts which the users define based on identity."[474]

In contrast, social media platforms principally facilitate the distribution and consumption of content. Much of the content on YouTube, for example, can be enjoyed by users with a wide range of relationships to the person posting, including by strangers.[475] Similarly, TikTok describes itself as a "global platform for users to express their ideas by sharing videos with a broader community."[476] In light of this distinction, the CMA concluded that YouTube is focused on offering content and does not compete with Facebook, facilitating communication and sharing content among groups of friends who choose each other and enjoy content in large part because of those relationships.[477]

In sum, social networking sites have a robust social graph, whereas content-centric sites do not.[478] Although users can share videos or stream events on Facebook and YouTube in similar ways, there is a fundamental difference between sharing a video among a person's social network on Facebook, Instagram, or WhatsApp—such as a child's first steps—and broadcasting it publicly on YouTube. While people may spend significant time on both YouTube and Facebook,[479] these firms provide distinct services to their users, and including both in the same market would be inconsistent with how users engage with each platform.

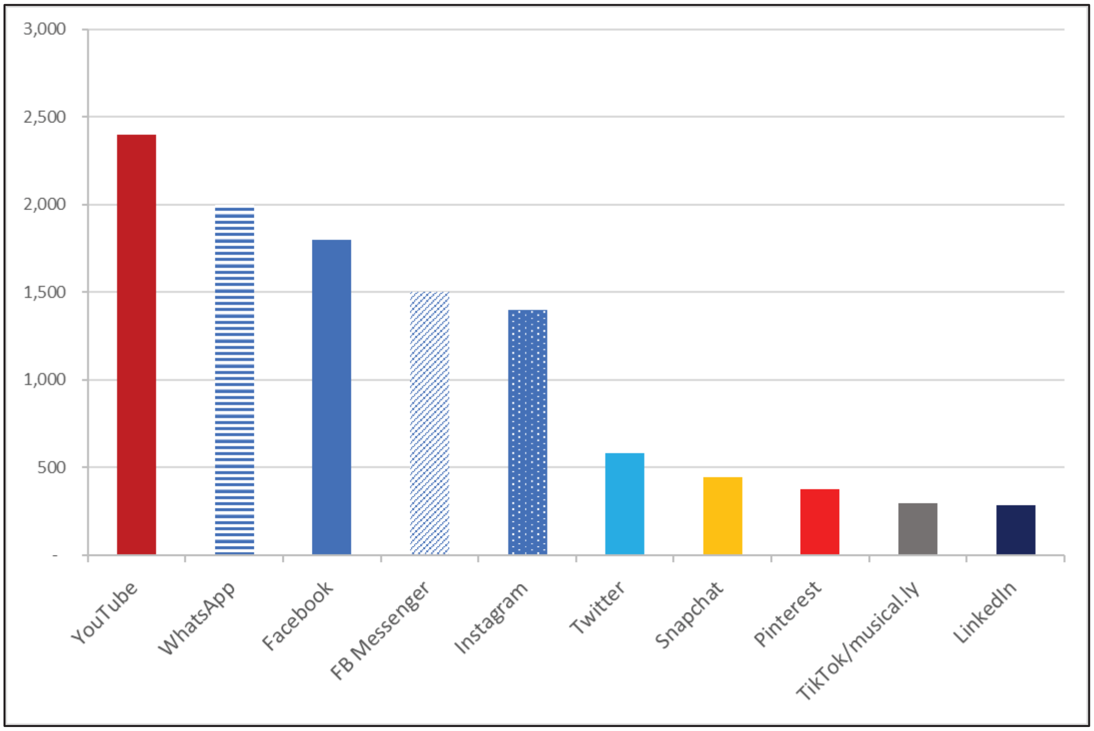
2. Market Concentration

Social platforms that are within a broad definition of social media include YouTube, Facebook and its family of products—Instagram, Messenger, and WhatsApp—as well as TikTok, Twitter, LinkedIn, Pinterest, Reddit, and Tumblr.[480] According to Facebook's internal market data, YouTube and Facebook's family of products were by far the most popular social media sites by Monthly Active Persons (MAP) as of December 2019.[481]

Social Media Companies by Monthly Active Persons (MAP) in Millions[482]



The social network marketplace is highly concentrated. Facebook (1.8 billion users) and its family of products—WhatsApp (2.0 billion users), Instagram (1.4 billion users)— have significantly more users and time spent on its platform than its closest competitors, Snapchat (443 million users) or Twitter (582 million users).[483] TikTok is growing quickly and is often referenced as evidence that the

social media landscape is competitive.[484] Although it meets the broad definition of social media as a social app for distributing and consuming video content, TikTok is not a social network.

D. Mobile App Stores

Mobile application stores (app stores) are digital stores that enable software developers to distribute software applications (apps) to mobile device users.[485] A mobile app is a standardized piece of software optimized for use on a mobile device. Users can install this software to access digital content or services, share content, play games, or make transactions for physical goods and services. Apps are configured to run on a device's operating system as "native apps." These apps may be pre-installed on a mobile device as a component of the operating system or by the device manufacturer, downloaded from an app store, or loaded directly from the web using a browser—a process referred to as sideloading. Software developers upload apps and updates to app stores, and mobile device users can then install apps by downloading them from the app store to their device.

App stores include free and paid apps that charge a fee. In addition to allowing users to install apps, app stores enable users to search, browse, and find reviews for apps, as well as remove apps from their devices.[486] The leading app stores also offer tools and services to support developers to building apps for the app store.[487] App stores have rules that govern the types of apps permitted in the app store, conduct of app developers, how users pay for apps, the distribution of revenue between the app and the app store, and other details regarding the relationship between the app store operator and the app developers that distribute apps through the store.[488]

App stores provide mobile device users with a sense of trust and security that the apps they install from an app store have been reviewed, will not harm the user's mobile device, will function as

[488] *See Apple App Store Review Guidelines*, APPLE, https://developer.apple.com/app-store/review/guidelines/#legal; *Apple Developer Program License Agreement*, APPLE, https://developer.apple.com/services-account/agreement/XV2A27GUJ6/content/pdf; *Google Play Developer Policy Center*, GOOGLE, https://play.google.com/about/developer-content-policy/; *Google Play Developer Distribution Agreement*, GOOGLE, https://play.google.com/intl/ALL_us/about/developer-distribution-agreement.html .

intended, and will not violate user privacy.[489] App stores also reduce customer acquisition costs for app developers by allowing developers to reach an extraordinarily large consumer base—every mobile device user in the U.S. is addressable by developing for the Apple App Store and the Google Play Store. By reducing the costs of app developers, app stores help make software applications more affordable for consumers.[490]

Deloitte has explained that app stores provide developers with various benefits, including providing a consistent interface and experience for users on a mobile operating system, a secure platform for apps, storage systems for hosting apps and managing downloads and updates, and billing and payment management systems that can reduce overhead for developers.[491] Apple and Google also provide developers with software-development tools to create, test, and publish apps; technical support and analytics tools; and tutorials.[492]

The mobile operating system on a device determines which app stores the user can access. The provider of the mobile operating system determines which app stores may be pre-installed on devices running the operating system, and whether and how additional app stores may be installed. As discussed elsewhere in the Report, both Apple and Google have durable and persistent market power in the mobile operating system market; iOS and Android run on more than 99% of mobile devices in the U.S. and globally.[493] There are high switching costs in the mobile operating system market and high barriers to entry. Due to their dominance in the mobile operating system market, Apple and Google have the power to dictate the terms and extent of competition for distributing software on to mobile devices running their respective mobile operating systems.[494]

The Google Play Store is the primary app store installed on all Android devices. The Apple App Store is the only app store available on iOS devices.[495] Apps are not interoperable between operating systems—native apps developed for iOS only work on iOS devices, and native apps

developed for Android only work on Android devices.[496] The App Store and the Play Store do not compete against one another. Android users cannot access the Apple App Store, and iOS users cannot access the Google Play Store, so the dominance of the Play Store is not constrained by the App Store and vice versa.[497]

Statista reports that in the first quarter of 2020 there were approximately 2.56 million apps available in the Google Play Store and 1.847 million apps available in Apple's App Store.[498] Apple's App Store is the only means to distribute software on iOS devices.[499] The Google Play Store is the dominant app store on Android devices; however, Google does permit users to sideload alternative app stores. Some Android device partners, such as Samsung, pre-install their own app stores on their devices.[500] Leading alternative Android app stores include Amazon's Appstore, Aptoide, F-Droid, and the Samsung Galaxy Store.[501] App developers who want to reach the entire addressable market of U.S. or global smartphone users must have an app in both the App Store and the Play Store.[502] Apple and Google also determine the terms and conditions app developers must agree to in order to distribute software through the App Store and Play Store, respectively. As a result, app developers and industry observers agree that Apple and Google control the app distribution market on mobile devices.[503]

Law, 4 (Oct. 31, 2019) (on file with Comm.); Kara Swisher, *Is It Finally Hammer Time for Apple and Its App Store*, N.Y. TIMES (June 19, 2020), https://www.nytimes.com/2020/06/19/opinion/apple-app-store-hey.html?referringSource=articleShare.

There is no method for a third-party app store to challenge the App Store on iOS devices. Apple CEO Tim Cook told the Subcommittee that Apple has no plans to open iOS to alternative app stores.[504] For a third-party app store to successfully challenge the Play Store, consumers must be able to install the app store and the store must have popular apps that users want. As with mobile operating systems, network effects create momentum so that as more consumers install software from the app store, more developers will build apps for the app store, increasing the value of the app store for users and attracting more consumers. Once users have migrated to a large platform—such as an operating system and its app store, it is difficult for smaller competitors to attract users and app developers.[505]

The United Kingdom's Competition and Markets Authority observed that "almost all mobile app downloads are made through the App Store, on iOS devices, or Google Play, on Android devices."[506] Alternatives app distribution methods such as third-party app stores, gaming platforms, or sideloading are often irrelevant to the mobile applications market, not always practical options for users, have significant disadvantages compared to the pre-installed app stores, and offer only limited functionality.[507]

Web sites and web apps are not competitively significant alternatives to the dominant app stores on iOS and Android devices for distributing software to mobile devices. Apps provide a deeper, richer user experience and can provide additional functionality by accessing features within the mobile device's hardware and operating system, such as a camera or location services.[508] Web apps and browsers are also reliant on the device being connected to the Internet. Native apps can continue to work even when a device loses access to the Internet.[509] Apple's App Store Review Guidelines differentiate apps from websites, explaining that apps submitted to the App store "should include

[509] *See* Interview with Source 88 (May 12, 2020).

features, content and [a user interface] that elevate [the app] beyond a repackaged website."[510] Curation and centralized review of apps is an advantage touted by app store operators. Apple CEO Tim Cook explained to the Subcommittee that on iOS devices, Apple's control of software installation through the App Store ensures downloaded apps "meet our high standards for privacy, performance, and security," which is important for maintaining user trust.[511] Additionally, distributing software via app stores lowers customer acquisition costs for software developers.[512]

Consumers do access content on their mobile devices via the open Internet. However, mobile apps are the primary way users access content and services on mobile devices and have become integral in Americans' daily lives for basic communication, business transactions, entertainment, and news. In the U.S., nearly 90% of the time users spend online on mobile devices occurs in apps.[513] Software distribution via web apps or through a website accessible on a browser is not a competitively significant alternative to distributing apps through the dominant app store on a mobile device and does not discipline the market power of the dominant app stores controlled by Apple and Google.

Similarly, the ability for consumers to sideload apps—installing apps without using an app store—does not discipline the dominance of Apple and Google in the mobile app store market. Apple does not permit users to sideload apps on iOS devices, and few consumers have the technical savvy to "jailbreak" an iOS device to sideload apps.[514] Google does permit sideloading on Android devices, but developers find that given the option, consumers prefer to install apps from app stores and few opt for sideloading.[515] Google has created significant friction for sideloading apps to Android devices. One developer explained to Subcommittee staff that sideloading entails a complicated twenty-step process, and users encounter multiple security warnings designed to discourage sideloading.[516] Additionally, software developers that have left the Play Store to distribute software to Android users via sideloading have experienced precipitous declines in downloads and revenue and report problems updating their

[516] Interview with Source 83 (June 30, 2020).

apps.[517] Thus, the option for sideloading apps on mobile devices does not discipline the market power of dominant app stores.

There are no competitive constraints on the power Apple and Google have over the software distribution marketplace on their mobile ecosystems. The core benefit of mobile app stores—centralizing and curating software distribution—also gives Apple and Google control over which apps users discover and can install.[518] As the gateways to the primary way users access content and services on mobile devices, the App Store and the Play Store can extract revenue from and exercise control over everything users do on their devices.[519] This dominance enables Apple and Google to establish terms and conditions app developers have to comply with, leaving developers with the choice of complying or losing access to consumers. The terms and conditions app stores impose include requirements regarding app functionality, content, interactions with consumers, collection, and distribution of revenue between the app and app store.[520]

Mobile app stores charge app developers commissions on sales of paid apps through the app store. Apple and Google, along with other mobile app stores on Android devices, charge a 30% commission when users install the app.[521] Apple established its 30% commission on paid apps in 2009 with the introduction of the App Store, and that rate has become the industry standard.[522]

Apple and Google have both developed mechanisms for collecting payments from users for purchases within applications—these transactions are called in-app purchases (IAP). Apple and Google both charge developers a standard 30% for IAP.[523] In collecting IAP, Apple and Google collect user personal and payment information, process the payment, and then remit the payment to the app developer, minus a processing fee or commission.[524] Developers selling digital content through their

apps on iOS and Android devices are required to use the app store operator's IAP.[525] For subscription services, like news apps or streaming media, the commission is 15% for the second year and thereafter.[526] IAP systems provide mobile device users with convenience by allowing consumers to make transactions in their apps and only enter their payment details a single time, and protects user privacy by limiting sharing of sensitive financial information.[527] However, developers have noted that lack of competition in pricing by app stores, particularly given the scale the App Store and Play Store have achieved since introducing their standard commission rates for paid apps and in-app purchases, demonstrates the lack of competition in the software distribution market on both the iOS and Android ecosystems.[528] Developers have also said that the 30% commissions charged by app stores have led them to increase prices for consumers and diminished innovation by software developers.[529]

Apple and Google also develop and distribute apps that directly compete against third-party developers in their app stores.[530] This dynamic, coupled with the fact that App Store and Play Store are dominant distribution channels and can exert gatekeeper power over their platforms, has the potential to distort competition, lead to discrimination and higher entry barriers for third-party developers, and result in the app store operator self-preferencing its own apps, harming consumers and competition.[531]

New app stores face high barriers to entry. It is unlikely that a third strong mobile app ecosystem can emerge. To offer a new mobile app store that is compelling to consumers, the app store must have a built-in customer base to attract developers to build apps for the store and must have popular apps to attract customers. Before the introduction of the App Store, third-party apps were not a central component of the user experience on mobile devices. New entrants, such as Apple, could disrupt the mobile device and operating system market by offering superior handset design, user interface, and first-party applications. Now, third-party apps are critical to the success of any mobile ecosystem. Millions of apps are developed for iOS and Android, and leading device manufacturers have built their device ecosystems around those operating systems. As a result, it is unlikely that a new

mobile operating system entrant can disrupt the current market dynamics.[532] Because of the control that Apple and Google exert over software distribution on their mobile ecosystems and the unlikelihood of entry by a new competitive mobile operating system, it is unlikely that a new, competitive app store will be able to successfully challenge the existing, dominant app store operators.

E. Mobile Operating Systems

A mobile operating system (OS) provides a mobile device with its underlying functionality, such as user interface, motion commands, button controls, and facilitates the operation of the device's features, such as the microphone, camera, and GPS. The mobile OS is the interface between the mobile device hardware, such as the smartphone handset or tablet, and the applications that run on the device, like email or streaming apps. The mobile OS is pre-installed on mobile devices; an alternative mobile OS cannot be installed or substituted. The characteristics of the mobile OS determine aspects of the mobile device's performance and functionality, including the app stores and apps that can run on the device. The mobile OS also determines which company's ecosystem of products and services the device is integrated with.[533]

Google's Android and Apple's iOS are the two dominant mobile operating systems.[534] Combined, they run on more than 99% of all smartphones in the world.[535] The third-largest mobile operating system is KaiOS, which runs on feature phones (i.e., non-smartphone mobile devices).[536] Apple's mobile devices run on Apple's proprietary iOS operating system, while other leading handset manufacturers, such as Samsung, LG, and Motorola, run on Android.[537] iOS is not available on non-Apple devices.

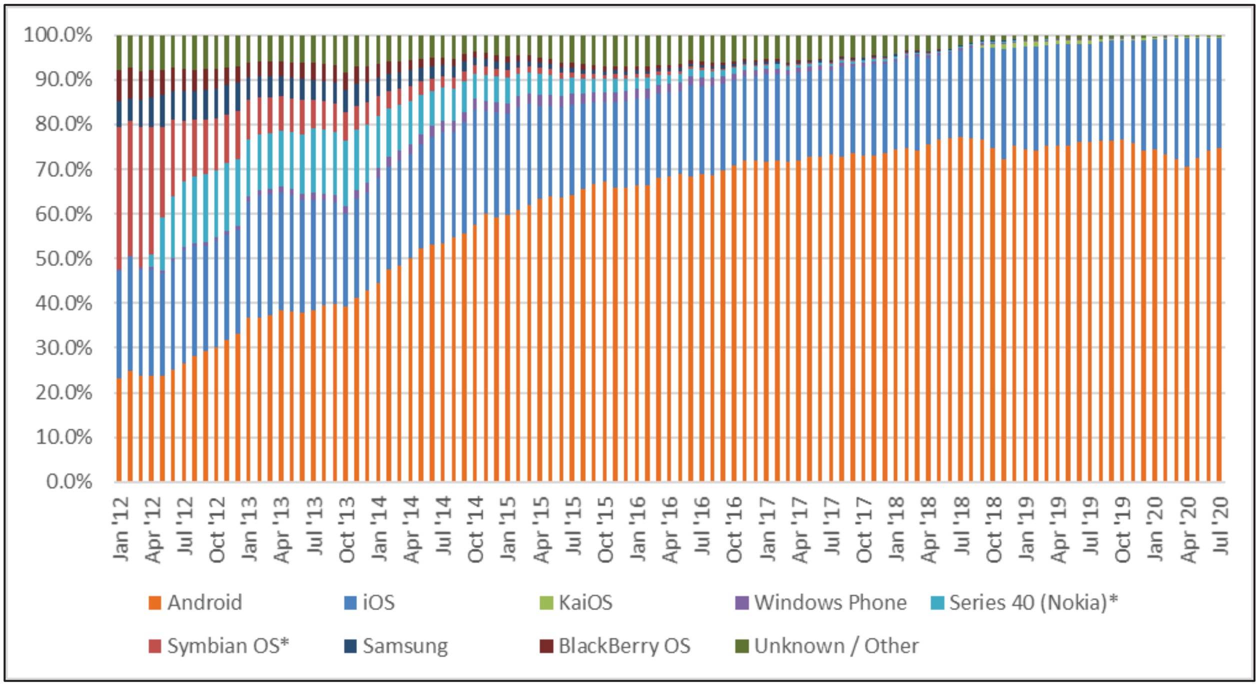
Mobile OS Market Share Worldwide[538]



Over the past decade, once-strong competitors have exited the mobile OS market, and Google and Apple have built dominant positions that are durable and persistent.[539] While there are other mobile OSs—such as Tizen, Sailfish OS, and Ubuntu Touch—those OSs make up less than 1% of the global mobile OS market.[540]

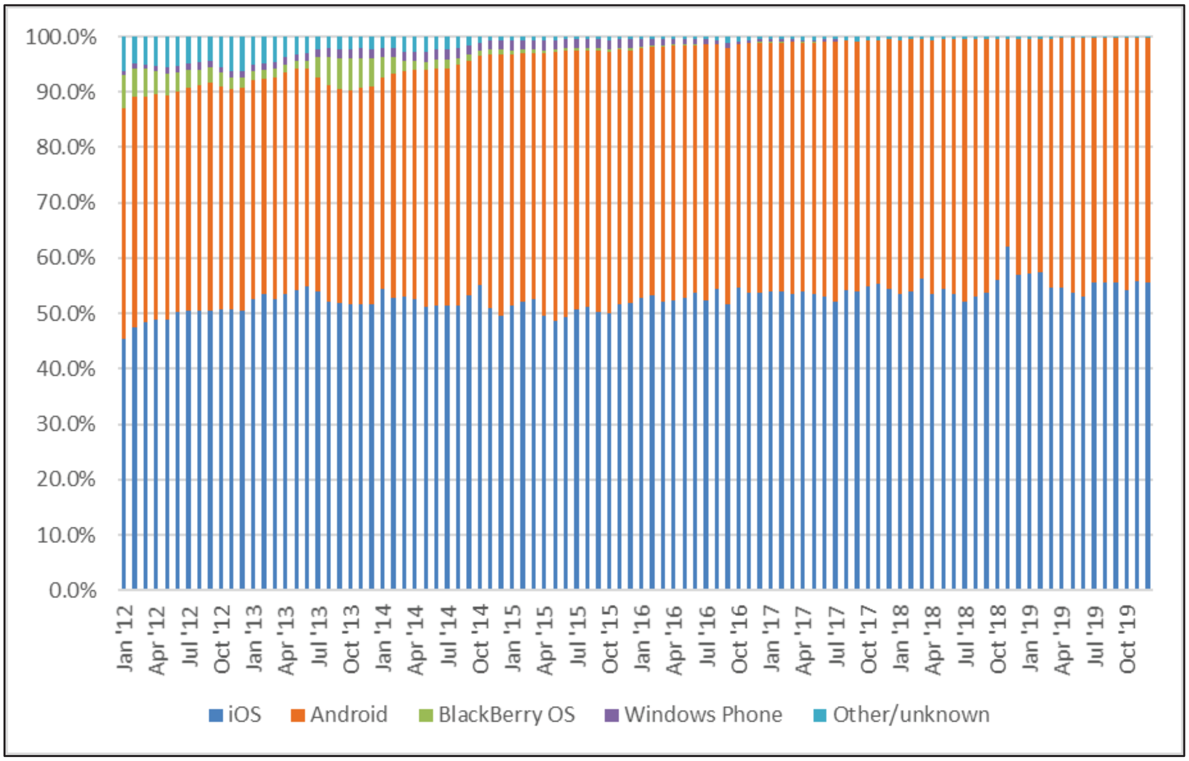
Market Share of Mobile Operating Systems in the U.S.[541]



Although both Google Android and Apple iOS both have dominant positions in the mobile OS market, high switching costs and a lack of on-device competition mean that neither firm's market power is disciplined by the presence of the other. The European Commission's investigation into Google's Android platform found that because iOS is not available on non-Apple devices, it cannot constrain Google's dominance in the mobile OS market.[542] Conversely, Android is not available on Apple devices and does not constrain Apple's dominant position and conduct on Apple mobile devices. An investment research firm recently noted that switching costs were high for Apple users because iOS is not available on non-Apple devices.[543]

There are significant barriers to switching between the dominant mobile operating systems. As a general matter, consumers rarely switch mobile operating systems. SellCell's 2019 survey found that more than 90% of users with iPhones tend to stick with Apple when they replace their current

[543] MORNINGSTAR EQUITY ANALYST REPORT, APPLE INC 1 (Aug. 6, 2020) (on file with Comm.).

device.[544] In 2018, Consumer Intelligence Research Partners reported that more than 85% of iOS users who purchased a new device purchased another iOS device, and more than 90% of Android users who bought a new device purchased a new Android device.[545] A 2017 study from Morgan Stanley found that 92% of iPhone owners intending to buy a new mobile device planned to buy another iPhone.[546] Mobile carriers—a main retail distribution channel for mobile devices—agreed that it is rare for customers to switch from one mobile OS because once customers are used to the mobile OS they generally do not switch.[547] App developers also said in interviews with Subcommittee staff that they observed minimal customer switching between iOS and Android.[548]

In addition to the cost of buying a new mobile device, consumers encounter other costs to switch to a new operating system. Android and iOS have different operating concepts, user interface designs, and setting and configuration options. As a result, instead of switching operating systems, "users pick one, learn it, invest in apps and storage, and stick with it."[549]

Other barriers to switching include the loss of compatibility with other smart devices designed to work in conjunction with the mobile device and its OS, the hassle of porting data from one OS to another, re-installing apps and configuring settings, and learning an unfamiliar user interface.[550] Apple's co-founder and former CEO Steve Jobs advocated this approach, noting Apple should "[t]ie all of our products together, so we further lock customers into our ecosystem."[551] Recently, Morningstar observed that people using Apple's other products such as the Apple Watch and AirPods

[551] Don Reisinger, *Steve Jobs wanted to 'further lock customers' into Apple's 'ecosystem'*, CNET (Apr. 2, 2014), https://www.cnet.com/news/steve-jobs-wanted-to-further-lock-customers-into-apples-ecosystem/.

"lose significant functionality when paired with a smartphone other than the iPhone," locking iPhone users into the iOS ecosystem.[552] Competition regulators in the Netherlands explained that this strategy creates "path dependency" for consumers. Although mobile devices have a limited lifespan and consumers might be expected to "break the lock-in cycle" when it is time to upgrade to a new device, consumers often have software, data and files, and other hardware and accessories that are only compatible with one product ecosystem, making it unlikely they switch to a non-compatible mobile device.[553]

There are significant entry barriers in the mobile operating system market. One former mobile OS competitor observed that its experience showed that it was doubtful that a new, competitive mobile OS will emerge in the U.S.[554] Another former mobile OS provider explained that it exited the market after concluding "the market for mobile operating systems was too established for a new entry."[555] To compete, a new OS must offer a superior product packaged in an attractive handset, as well as a fully realized suite of apps and compatible devices comparable to what Apple and Google (and Google's hardware partners) currently offer. Industry experts have testified before the Subcommittee that the "reality is that it would be very difficult for a new mobile phone operating system today" to compete with Apple and Google, "even if it offered better features."[556] Investment analysts agree, noting it is likely Android and iOS "will continue to power nearly every smartphone around the world in the long run."[557]

The mobile OS market is also characterized by strong network effects. In short, a new mobile OS must have a sufficiently large user base to attract app developers to build apps to run on the OS. An OS with an insufficient number of users and developers is unlikely to receive support from mobile device manufacturers that will install the OS on their devices, or mobile network operators that will support those devices on their networks.[558]

The most important factor that developers consider before building apps for an OS is the install base of the OS—how many users have devices running the OS that can install the app. Developers will

(Jan. 2, 2013), https://money.cnn.com/2013/01/02/technology/mobile/ubuntu-smartphone-linux/ (explaining success in the mobile market required more than merely building a superior OS to Android or iOS, it also requires a robust app ecosystem).

[557] MORNINGSTAR EQUITY ANALYST REPORT, APPLE INC 3 (Aug. 6, 2020) (on file with Comm.).

[558] Interview with Source 407 (Sept. 10, 2020).

not build apps for an OS with few users.[559] This reinforces the power of dominant mobile operating systems. The more consumers use the OS, the more developers will build apps for the OS, increasing the value of the OS for users and attracting more consumers.[560] Consumers are unlikely to purchase a device with an OS that cannot run the most popular apps and lacks a robust app ecosystem comparable to what is offered by iOS and Android. Due to the dominance of Apple and Google in the mobile OS and app store markets, "there is little incentive for app developers to go the trouble and expense of ensuring their apps work on any smaller rival operating systems," because the user base would be too small.[561]

Additionally, the third-party app ecosystem advantages of iOS and Android make new market entry unlikely. The U.K.'s Competition and Markets Authority explained that, before the iPhone, third-party apps were not part of the mobile experience. As a result, new entrants like Apple could enter the market and compete by offering a superior product. But now, there are "millions of apps that have been written for Apple's iOS and Google's Android, making it hard for a new entrant mobile operating system to offer a competitive and attractive product."[562] The European Commission (E.C.) has similarly observed that strong network effects have created high entry barriers in the mobile OS market.[563]

Over the past decade, several large technology companies have attempted and failed to leverage their large user bases to compete against Apple and Google in the mobile OS market.[564] Facebook and Amazon both tried to enter the market with variants of Google's Android OS. Both companies quickly exited the market because consumers were mostly accessing Facebook and Amazon content through apps on iOS and Android devices.[565] Technology reviewers also expressed disappointment that

(Jan. 6, 2015), https://www.fastcompany.com/3039887/under-fire.

Amazon's Fire Phone did not offer the same extensive library of apps and services as iOS or Android devices.[566]

Companies like Mozilla and Alibaba have also attempted to enter the mobile OS market. Mozilla unveiled its Firefox OS in 2013 and exited the market altogether by 2016.[567] In 2012, Chinese tech giant Alibaba developed a mobile OS called Aliyun for the Chinese market. However, Acer, Alibaba's hardware partner, abruptly canceled its collaboration with Alibaba before the launch of Acer's device running the OS[568]

Over the past decade, once-competitive mobile operating systems like Nokia, BlackBerry, and Microsoft struggled to survive as Apple and Google grew more dominant, eventually exiting the marketplace altogether. BlackBerry—once a leading mobile OS developer—now licenses the BlackBerry name to TCL to market TCL's smartphones. TCL's BlackBerry phones run on Android.[569] In the last quarter of 2016, Windows devices accounted for less than half of 1% of new smartphone sales.[570] In 2017 Microsoft abandoned its mobile OS business, and by that time, more than 99% of all new smartphones were running on iOS or Android and market observers expressed no confidence that new competition would emerge.[571] One key factor leading to Microsoft's withdrawal from the mobile

marketplace was that developers were reluctant to develop apps for a third mobile operating system when already building apps for iOS and Android.[572] These market dynamics remain in place today.

F. Digital Mapping

Digital mapping provides users with virtual maps of the physical world. There are two sets of customers for mapping services: consumers, who use map products for navigation, and businesses, who use underlying mapping libraries and design tools to produce customized maps. With the proliferation of smart devices, digital mapping has become a critical resource for users and businesses alike.

The essential input for both types of services is a digital-map database. Mapping data can be gathered in a few ways, including through the collection of imagery from satellites and streets, the tracking of global positioning system (GPS) traces, and the collation of public domain mapping data. Building a digital map database is costly and time-intensive, requiring significant investment in mapping technologies and data collection.[573] The leading provider of digital mapping data is Google. Smaller providers include HERE and TomTom, as well as open-source providers like OpenStreetMap (OSM).[574] Waze, which developed navigable maps by relying on driver-generated live maps and crowd-sourced updates, was an additional mapping provider purchased by Google in June 2013.

Consumer-facing providers of mapping services license map databases and layer search and traffic technologies atop of the map data. Consumers use these search and traffic tools either through a standalone turn-by-turn navigation service that licenses the underlying data—like MapQuest or Bing Maps—or through a vertically integrated provider, like Google Maps, Waze, or Apple Maps.[575] The dominant providers of consumer mapping applications are Google Maps and Google-owned Waze, followed by Apple Maps and MapQuest.[576] Google and Apple set their mapping products as the default

[574] Submission from Source 531, to H. Comm. on the Judiciary, Source 531-000628 (on file with Comm.).

[575] Although Apple Maps licensed U.S. mapping data from TomTom upon launching in 2012, in 2015 it began developing its own map database by deploying cars with cameras and sensors to collect images and mapping data that it could combine with anonymized iPhone data to create an independent underlying base map. Lauren Goode, *The Biggest Apple Maps Change Is One You Can't See*, WIRED (Jan. 31, 2020), https://www.wired.com/story/apple-maps-redesign/.

[576] Submission from Source 572, to H. Comm. on the Judiciary, 1 (Oct. 29, 2019) (on file with Comm.) ("For vehicle navigation, and excluding OEM-provided in-console automotive systems, Google's Waze and Google Maps are currently

options on Android and iOS products—their respective devices—which also enables them to maintain and expand their market position.

These providers of consumer mapping services generally do not charge users a monetary fee. Instead, they monetize maps through selling location-based advertisements or by subsidizing consumer-facing mapping with enterprise contracts or other lines of business. Although data on the value of the consumer-facing digital mapping industry is not publicly available, analysts have estimated that Google Maps earned Google around $2.95 billion in revenue last year and that the standalone product is worth up to $60 billion.[577]

Business-facing providers serve map design tools and mapping libraries required to produce customized maps. The leading providers of business-to-business mapping software are Google, HERE, Mapbox, and TomTom, followed by Apple Maps, Bing, ESRI, Comtech, and Telenav.[578] Some of these providers operate in more specialized markets. For example, HERE and TomTom primarily serve automotive customers, while ESRI provides desktop GIS software used by governments and spatial analysts.[579]

Market participants cite several factors that privilege dominant digital map incumbents and impede entry. First is the capacity of dominant firms to invest heavily in creating mapping databases and technology without needing to turn a profit. For example, prior to its acquisition by Google, Waze executives observed that Google Maps had "disrupted the market" primarily through "financial disruption," namely that it had "unlimited funds" and was giving away Google Maps to users for free.[580] Startups seeking to enter this market yet lacking the financial cushion that permits them to incur losses while developing the product will be at a relative disadvantage.

Another factor is that incumbents that are integrated can collect relevant map and location data from across complementary lines of business, feeding this data back into mapping. For example, one market participant noted that Google "collects an unparalleled amount of data used in digital mapping from users of its dominant search engine and Android smartphone OS."[581] Another market participant

the most used consumer apps by a wide margin."); Submission from Source 333, to H. Comm. on the Judiciary, 2 (Oct. 21, 2019) (on file with Comm.).

[579] *Id.*

[580] Production of Google, to H. Comm. on the Judiciary, GOOG-HJC-04209630 (Nov. 2012) (on file with Comm.)

[581] Submission from Source 531, to H. Comm. on the Judiciary, Source 531-000624 (on file with Comm.); Production of Google, H. Comm. on the Judiciary, GOOG-HJC-04211078 (July 24, 2013) (on file with Comm.) Google made a similar observation in July 2013. In a letter responding to the FTC's request for information relating to its acquisition of Waze,

stated that Google's dominant position in search and advertising incentivizes businesses to closely monitor and maintain the accuracy of their information in Google's systems, "leading to a dynamic by which Google enjoys a free, crowdsource effort to improve and maintain their data's quality," thereby improving the quality of Google Maps.[582] Firms without concurrent positions in web search and the smartphone market are comparatively disadvantaged.

A third factor is the superior distribution that integrated firms in maps-adjacent lines of business can provide their own mapping product at the expense of third-party mapping products. Google gives Google Maps default placement on its Android devices, while Apple does the same with Apple Maps on iOS devices. Together, Android and iOS account for 99% of the smartphone operating systems in the United States.[583]

Market participants explained that the default placement of Google Maps on Android devices also disadvantages third-party mapping providers technologically. If a developer chooses a third-party mapping provider when building an app, downloading that app on Android would involve downloading both the app features and the mapping functionality. Choosing to develop the app with Google Maps, by contrast, would reduce the app's file size on Android, as Google Maps is already on the device.

Lastly, incumbents benefited from a lack of prohibitions on collecting location data—an advantage that startups today lack given the passage of new data restrictions that limit the development of digital mapping technology. Notably, many of these rules came into existence following public outrage prompted by Google Street View. By the time these rules were implemented, Google had already mapped out most of the planet.

Except for Apple's independent mapping database, there has been no recent entry in the market for underlying mapping data. Similarly, the list of leading providers of consumer mapping services and business-to-business services has mostly been unchanged since 2013.

G. Cloud Computing

Cloud computing refers to the service that enables remote storage and software programs on demand through the Internet. Prior to cloud computing, data was stored locally on a computer's hard drive, in a local server room, or remote data center where companies managed all of the I.T.

Google wrote, "Apple has access to as much or more US GPS traffic data than Google does, with tens of millions of Apple iOS users potentially providing Apple with real-time traffic speed and flow information throughout the country.".

[582] Submission from Source 572, to H. Comm. on the Judiciary, 3 (Oct. 29, 2019) (on file with Comm.).

[583] Neth. Auth. for Consumers & Mkts. Study at 15.

services.[584] Today, companies can essentially rent "network access to a shared pool of configurable computing resources . . . [including] networks, servers, storage, applications and services."[585] As a result of the convenience and cost savings associated with the ability to scale up or down on demand, cloud computing has grown into one of the technology sector's largest and most lucrative businesses.[586] It has enabled the growth of enterprise businesses such as Netflix, Airbnb, Lyft, Slack, and the Weather Channel, as well as new startups that are not yet household names.

Cloud computing is a critical input to many of the digital markets the Subcommittee investigated, providing infrastructure for online commerce, social media and networking, digital advertising, voice assistants, and digital mapping—technologies that benefit from dynamic storage and computational power. In a future with smart homes, autonomous vehicles, and artificial intelligence applications in nearly every sector from agriculture to healthcare, understanding the dynamics of the cloud market becomes critical. These ground-breaking technologies work because they can access and analyze massive amounts of data in real time, companies looking to innovate in these spaces will struggle to rely solely on traditional I.T. and will likely turn to public cloud vendors. The testimony of Morgan Reed on behalf of ACT, the App Association, illustrates how important "continuous cloud access [is] to create custom software solutions that adapt quickly and rival the products and services of larger SaaS companies."[587]

Cloud computing service models vary by vendor, and new models are being developed continually. The Subcommittee's investigation focused on the dynamics between the three models most referenced and defined by the National Institute of Standards and Technology.

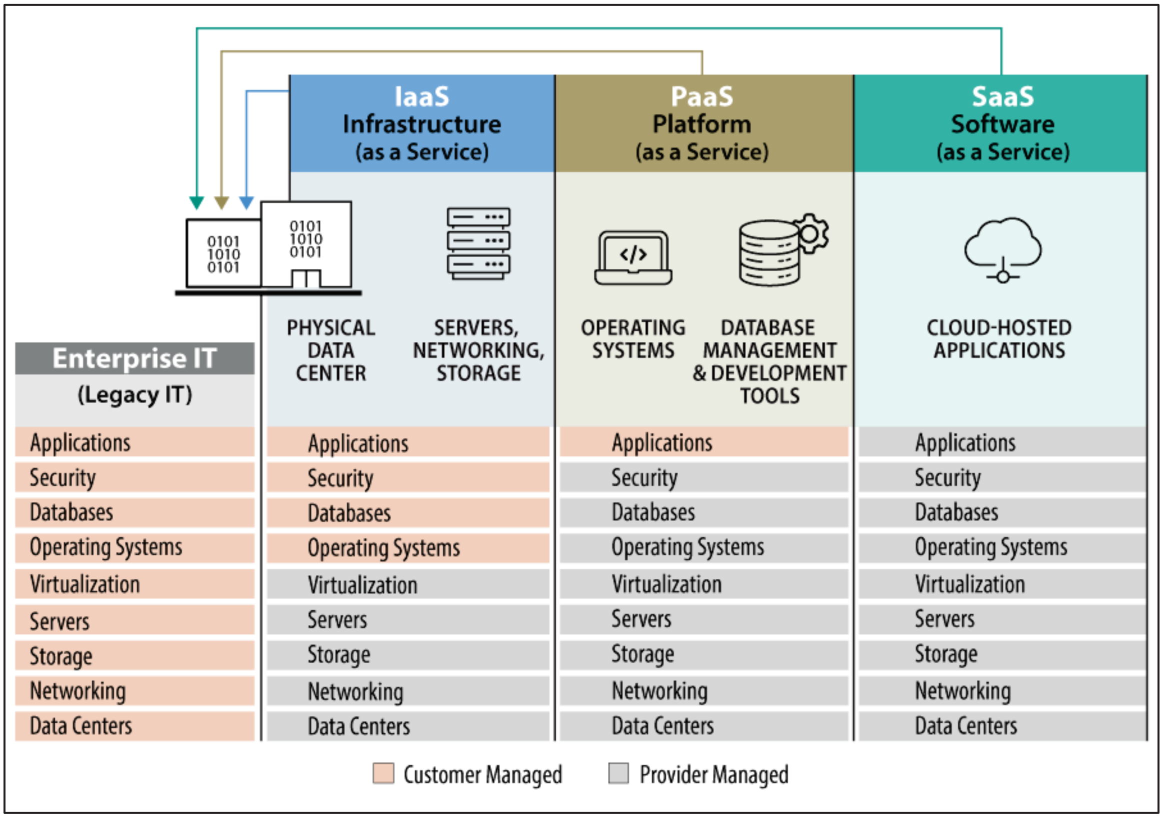
Cloud Computing Services[588]



In the Software as a Service (SaaS) model, the user accesses applications from various client devices "through either a thin client interface, such as a web browser, or a program interface."[589] Common examples include Google Docs, Slack, and Mailchimp. In the Platform as a Service (PaaS) model, the user, most often a cloud application developer, builds new applications by accessing programming languages, libraries, services, and tools supported by the cloud provider.[590] Common PaaS tools include AWS Elastic Beanstalk, Google App Engine, and Salesforce's Heroku. In the Infrastructure as a Service (IaaS) model, the user, most often an engineer, can deploy and run software, which can include operating systems and applications while the cloud provider provisions fundamental computing resources including processing, storage, and network applications.[591] Common IaaS tools include Amazon Elastic Compute Cloud (EC2), Google Compute Engine, and Microsoft Azure.[592]

SaaS, PaaS, and IaaS can be deployed through several different models.[593] Subcommittee staff focused primarily on the market for public cloud services in which the cloud provider provisions infrastructure for open use by the general public. The infrastructure resides on the premise of the cloud provider.[594]

To review market dynamics, Subcommittee staff examined two types of cloud service providers. The first type is infrastructure providers. Amazon Web Services (AWS), Microsoft Azure, and Google Cloud Platform (GCP) are the most common domestic infrastructure providers. They offer customers IaaS, PaaS, and SaaS offerings through their customer consoles or portals, but are distinct in their ability to offer IaaS at scale. This Report refers to them as infrastructure providers. They also operate online marketplaces for third-party software vendors to list cloud offerings that integrate with their infrastructure services.

The second type is third-party software vendors, sometimes referred to as Independent Software Vendors (ISVs). Companies such as Salesforce, MariaDB, and The Apache Foundation provide operating systems, databases, security, and applications. Third-party software can be delivered as a packaged software or managed service. When a third party provides packaged software, it can be installed onto a customer's existing cloud infrastructure. The packaged software can be listed on the infrastructure provider's marketplace or through a third-party vendor's website.

When third-party software is sold as a managed service, the customer pays a subscription based on the number of services used, and the third-party software vendor manages all the underlying infrastructure.[595] In this scenario, the software has become a cloud offering sold "as-a-service." The underlying infrastructure can be owned and managed by the third-party software vendor or the third-party software vendor may have contracts with an infrastructure provider, and in some cases, the software vendor uses a combination of owned and rented servers. For example, Salesforce's Heroku—a PaaS product—is built using AWS IaaS offerings.[596] When a company purchases a Heroku license, Salesforce's use of AWS is included in the price. In the case that a PaaS or SaaS offering uses its own infrastructure, it is likely it will need to be able to integrate with products managed by the infrastructure providers as it grows and, to expand to new regions, it will need to contract with infrastructure providers.[597]

AR_003403

In 2018, public cloud services, including IaaS, PaaS, SaaS, and management services, accounted for $182.4 billion of the overall $3.7 trillion information technology (I.T.) infrastructure spending worldwide—less than 1%.[598] Despite being a small fraction of I.T. spending, Gartner projects the market size of the cloud services industry to increase at nearly three times the rate of overall I.T. services through 2022, to reach $331 billion.[599] AWS is the market leader, capturing approximately 24% of the U.S. spend on cloud computing in 2018.[600]

Amazon—the leading cloud platform—is dominant in the cloud market due to the concentration of the IaaS market.[601] According to Gartner, "the worldwide IaaS market grew 31.3% in 2018 to total $32.4 billion, up from $24.7 billion in 2017."[602] As seen in the chart below, AWS is the unquestioned leader in the cloud computing infrastructure market, with triple the market share of Microsoft. Alibaba, Google, and Microsoft are growing at the fastest rates—rates double that of Amazon. Gartner expects the IaaS Worldwide Public Cloud Service Revenue to grow faster than any other set of services, and to be worth $76.6 billion in 2022.[603]

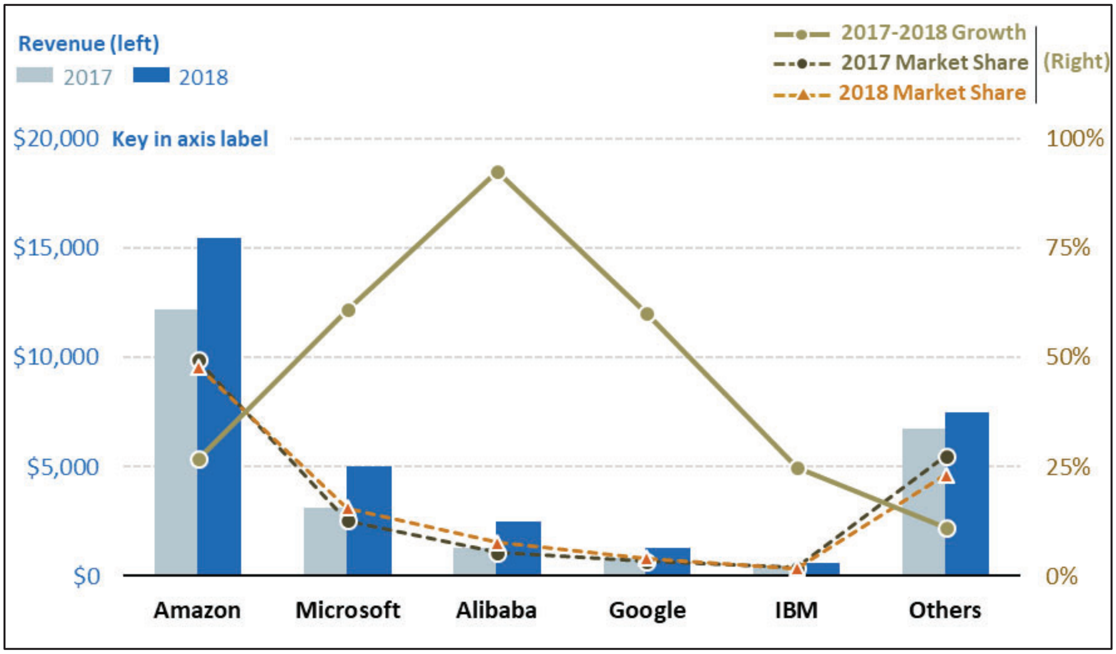
IaaS Worldwide Public Cloud Services Revenue (Millions of US Dollars)[604]



Industry reports suggest that the cloud computing market is consolidating around three providers domestically—AWS, Microsoft Azure, and Google Cloud Platform.[605]

Market leaders benefit from early-mover advantage coupled with network effects and high switching costs that lock-in customers. AWS pioneered cloud computing, launching officially in March 2006 with Simple Storage Service (S3) and Elastic Compute Cloud (EC2), two fundamental IaaS offerings.[606] Microsoft announced Azure in October 2008 along with core services that made up the "Azure Services Platform."[607] Google's first public cloud service, App Engine, a PaaS offering, was released in 2008.[608] Google's Compute Engine, an AWS Elastic Compute Cloud and Microsoft Azure Virtual Machines competitor, went live as a preview in June 2012.[609]

[609] Ryan Lawler, *Google Launches Computer Engine to Take on Amazon Web Services*, TECHCRUNCH (June 28, 2012), https://techcrunch.com/2012/06/28/google-compute-engine/.

A 2010 Google strategy document predicted that the cloud computing market would concentrate. An internal document titled "Where Industry is Headed in 5 Years," stated that there would be some concentration in the market within five years, with cloud service providers consisting of Google, Amazon, Microsoft, and a hybrid of Cisco and VMWare.[610] According to this document, each company would offer cloud-based apps and other tools.[611] Later, in a 2018 strategy document, Google emphasized the importance of first-mover advantage in the space, writing "AWS and Azure have had more years to gain customers, and cloud customers typically grow [in] scale over time; in contrast" reiterating the tendency for cloud customers to choose a single vendor as their primary cloud service provider.[612] In a roundtable held by Subcommittee Chairman Cicilline, Mark Tracy, the CEO of Cloudacronomics, described these concerns:

> We pull down terabytes of data, and they have to upload it to the cloud to improve farmers practices. The two cloud providers are AWS and Azure. Since so many businesses and so much value can be extracted by improving health and data, this concentration of cloud services is a concern.[613]

As seen in the figure below, IaaS prices have decreased over time, with the three dominant U.S. providers able to price their services at less than $30/GB RAM according to a 2018 RBC Capital Markets report. [614] Market participants reference economies of scale and a focus on increasing revenue from PaaS and SaaS offerings, as opposed to IaaS offerings, as an explanation for this trend. IaaS vendors benefit from economies of scale both with regards to the size of the datacenters and the ability to operate multiple data centers across the globe. To enter the market and reach the economies of scale needed to compete with the incumbents, infrastructure providers must invest significant capital and be able to offer competitive prices to lure customers.

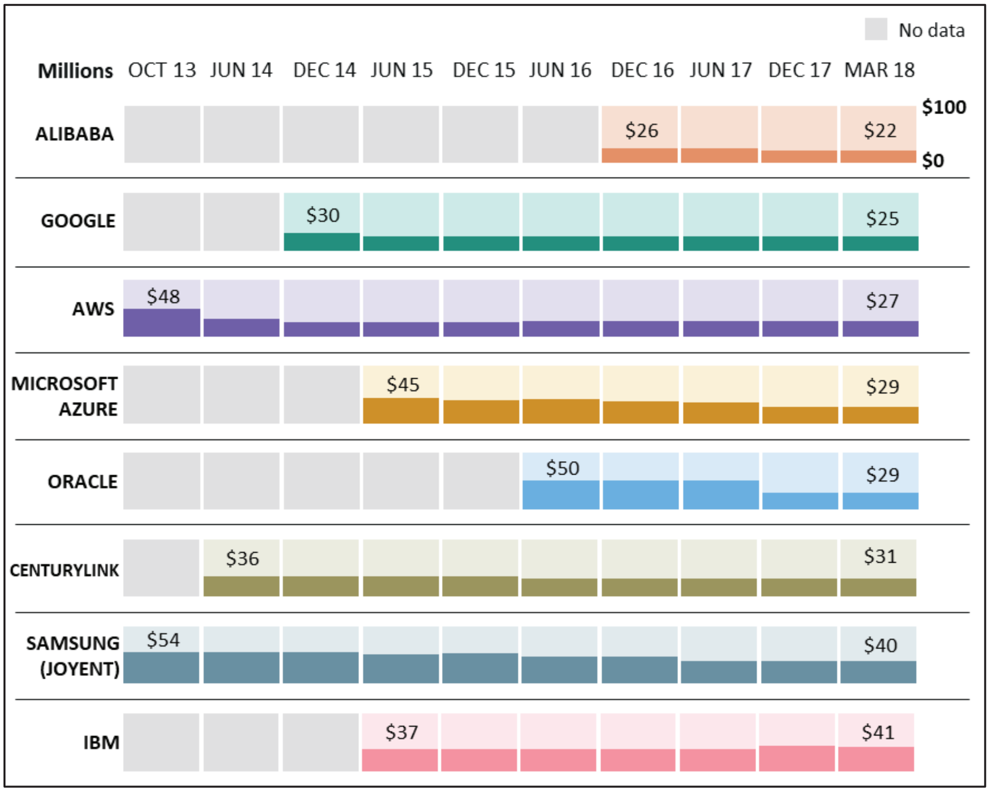
Average Monthly Costs Per GB RAM Across 15 Use Cases[615]



The "cloud" is a system of cables connected to a wide network of data centers—all underground, underwater, or in large industrial buildings. Building data centers in dozens of regions worldwide costs billions of dollars.[616] Market participants described the investment as "bigger than building a cellular network" and only "for countries and major companies."[617]

Two additional inputs that can provide a barrier to becoming a leading infrastructure provider are compliance certifications and reputation. Federal Risk and Authorization Management Program (FedRAMP) authorization is required for any service that holds U.S. federal data.[618] The

FedRAMP authorization process can be resource and time-intensive as vendors have to undergo a process of technical and security reviews and audits.[619]

When a customer chooses to use cloud computing, they must trust that their data will be secure and available to access quickly. The leading cloud infrastructure providers are major technology companies that handle massive amounts of data and run large technical operations before offering managed services. Market participants have shared with Subcommittee staff that a smaller company attempting to enter the IaaS market to contest these firms must convince large customers that they can provide a reliable service that is compliant with industry-specific regulations.[620]

Market participants and industry reports highlight that IaaS offerings have become commoditized. To compete, infrastructure providers must offer a range of PaaS and SaaS services to attract users and developers to their platform.[621] First-party PaaS and SaaS offerings are made available in the infrastructure provider's console. As of this Report, AWS, Azure, and GCP all list over 100 first-party cloud offerings.[622] Each cloud infrastructure provider has taken its own approach to building its platform, but all involve acquisitions, in-house software development, and the use of open-source software. Google and Azure have also relied on their company's existing products—Microsoft leveraging its Office 360 Suite and Google leveraging its collection of APIs.[623]

In the case that a new entrant can overcome this entry barrier, it must also invest substantial resources to overcome network effects within the market. Infrastructure providers benefit from network effects—the more customers on a platform, the more third parties build services that integrate well with that platform leading to more services to attract customers. Amazon, Microsoft, and Google all have hundreds of products listed in their third-party marketplace, while Amazon lists 9,250.[624] In interviews with Subcommittee staff, third-party software vendors said that they had little choice but to integrate their products with the incumbents, most notably, AWS.

Cloud infrastructure providers also need to ensure that the knowledge and expertise of their platform's technology are available to their customers. To achieve this, cloud infrastructure providers launch partner networks that include consulting firms trained to help enterprise customers move to the

public cloud, such as AWS Partner Network (APN) Consulting Partners[625] and Microsoft Solution Providers.[626] Cloud infrastructure providers also offer trainings and exams to certify members of the workforce as proficient in various uses of their technology. Additionally, infrastructure providers have programs to support third-party software vendors working to integrate with the infrastructure provider's cloud.

Many market participants interviewed by Subcommittee staff believe that surpassing the incumbents in the market will be challenging because of the potential for vendor lock-in. Other evidence reviewed by Subcommittee staff bolsters this concern, suggesting that lock-in exists because switching costs for cloud computing customers are high.[627]

Subcommittee staff has identified several common techniques infrastructure providers use to initially lock-in customers, including contract terms, free tier offerings, and egress fees. The first is long-term contracts. In several responses to the Committee's requests for information, third parties explained they have contracts lasting from 3-to-5 years with the infrastructure providers.

Another common technique is using free tier products, where each cloud platform offers a free tier of services ranging from always free to trial offers.[628] Market participants suggest that while the free tier products vary slightly among the major firms, they are relatively similar. When a customer's free trial expires, it is faced with switching to another provider or starting to pay for service. Switching requires an investment of time and resources to adapt to the new service provider, as well as possibly paying egress fees to the prior vendor. As a result, customers may decline to switch at the conclusion of free trials.

Whether a customer begins using cloud on free tier products or not, once they have substantially built and migrated to a platform, they face high switching costs in the form of fees to move the data, along with the technical and labor costs associated with switching the data. When a company moves data into the cloud from hard drives or private servers, they are often charged ingress fees, which are generally low or free.[629] When a company, however, chooses to move data to another infrastructure provider, they are charged an egress fee. Egress fees vary slightly by company and region.

[629] *All Network Pricing*, GOOGLE CLOUD, https://cloud.google.com/vpc/network-pricing (last visited on Oct. 4, 2020).

Market participants explain that egress fees are often not transparent and are sometimes charged even when data is not leaving the datacenter.[630] One market participant said that these fees "can create significant financial barriers to migrating away from particular cloud storage providers."[631]

Additionally, when a customer decides to move any of its operations to a different infrastructure provider, it often must overcome technical design challenges. Several market participants spoke to the challenges of finding cloud developers that know the underlying technology of multiple cloud infrastructures as a barrier to both switching, either from one cloud to another or to set up multi-cloud operations. As one third party describes, "businesses often have to calibrate a complex set of technical frameworks, settings, and customized interfaces to adapt their business to the potentially unique way the cloud storage provider has chosen to operate their service."[632] For example, in an investor statement in 2020, Snap explained:

> [T]he vast majority of our computing [runs] on Google Cloud and AWS, and our systems are not fully redundant on the two platforms. Any transition of the cloud services currently provided by either Google Cloud or AWS to the other platform or to another cloud provider would be difficult to implement and will cause us to incur significant time and expense.[633]

When asked about lock-in, many market participants discussed how in response to the rise of a few dominant platforms in the cloud market, new strategies have emerged to increase portability between vendors and allow customers to use multiple clouds. Market participants note, however, that today interoperability is a challenge, and it is unclear how cooperative dominant cloud infrastructure providers will be in supporting partnerships and standards to facilitate these strategies. Given the current trends towards concentration in the cloud infrastructure market, further scrutiny of the role standards play toward decreasing switching costs and enabling portability and interoperability is warranted.

Finally, Subcommittee staff interviewed market participants about related competition concerns facing third-party software vendors. Many third-party software vendors compete with first-party products listed in the infrastructure provider's console. Market participants explain that these competitive offerings are often the first products customers see because they are displayed within the customer's existing console in a format that makes it easier for users to add to their existing cloud

[633] Snap Inc., Annual Report (Form 10-K) 11 (Dec. 31, 2019), http://d18rn0p25nwr6d.cloudfront.net/CIK-0001564408/0cfebc98-816e-44ac-8351-5067b4f88f0c.pdf.

stack, seamlessly including the product in their billing and licenses and with minimal technical set-up.[634]

As a result, it is difficult for customers to compare prices and features included in the offerings when they are not listed side-by-side. Although third-party vendors can sell their service directly to consumers through their own websites, many smaller cloud vendors use the marketplaces of the dominant infrastructure providers to reach customers, which require fees and are subject to competition concerns that are similar to other marketplaces examined by Subcommittee staff during the investigation. Market participants have raised concerns that cloud infrastructure providers can preference their own offerings, or offer these products with exceedingly steep discounts, making it difficult for third-party software vendors with fewer products to compete.[635]

Significantly, because the leading infrastructure providers have access to competitively significant data in the marketplace, they have insight into usage metrics regarding any managed service that runs on their infrastructure.[636] Market participants told the Subcommittee that they have concerns that this data can be used by infrastructure providers to make decisions regarding which types of software to acquire or replicate to offer through their first-party console.[637]

H. Voice Assistant

Voice assistants act as a user interface that enables exchanges between computing devices through a person's voice.[638] Today users can ask their electronic devices to play the morning news or start a conference call.[639] When combined with smart speakers, voice assistants can become a gateway to the internet, and can also be used to connect other "smart" devices, such as lighting, thermostats, security monitors, and even kitchen appliances.[640] While voice assistants began as mobile phone apps, they have become integrated into other devices, including cars and homes.[641]

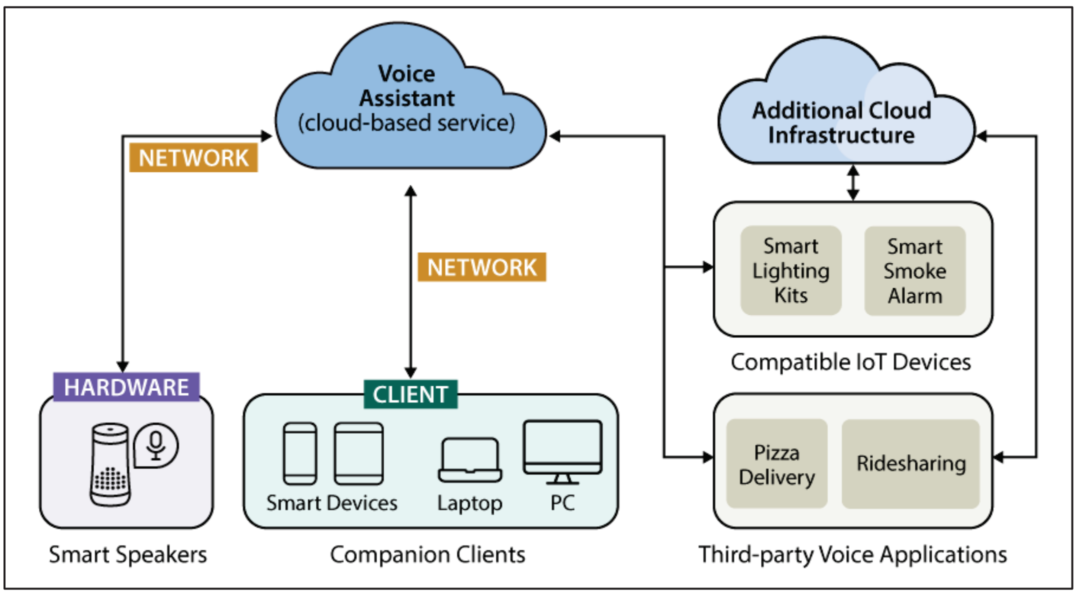
There are two types of voice assistants on the market: general and specialized. General voice assistants—such as Siri, Alexa, and Google Assistant—can respond to queries and interact with a range of applications. Specialized voice assistants focus on a specific vertical—such as healthcare or banking—where there is a limited vocabulary universe and more specific responses.[642] For example, Snips, a privacy-centric voice assistant owned by Sonos, specializes in commands for playing music on smart speakers.[643]

Today, voice assistants interact with humans by receiving specific requests and sending feedback through a voice response. The first step is to deliver the "wake word"—such as "hey, Siri" on iPhones—designed to activate the system. Once activated, a voice assistant can execute a command, which triggers a voice application.[644]

Voice Assistant Ecosystem[645]



Although there are multiple types of voice assistants within the ecosystem, Subcommittee staff focused primarily on voice assistant platform vendors and third-party hardware manufacturers, including smart speaker manufacturers and Internet of Things (IoT) compatible device manufacturers. The business model for these two groups varies. A Voice assistant platform vendors can monetize its platform by using its ecosystem to drive revenue to complementary lines of business such as e-

[645] Prepared by the Subcomm. based on Hyunji Chung, Jungheum Park & Sangjin Lee, *Digital Forensic Approaches for Amazon Alexa Ecosystem,* DFRWS (2017), https://arxiv.org/ftp/arxiv/papers/1707/1707.08696.pdf

commerce, search, or entertainment.[646] It can also charge voice-application developers to be the recommended application for a specific command.[647] As they become widely adopted, stores on voice assistant platforms—such as the "Alexa Skills Store"—can offer premium content and collect revenue share on payments.[648] Third-party hardware manufacturers generate income by selling hardware, and in some cases, by offering subscription services such as home monitoring.[649]

Voice assistants have grown in popularity over recent years due to technological advancements in natural language processing. Although the market is nascent, market participants and industry experts view voice-enabled devices as an opportunity to lock consumers into information ecosystems. The smartphone and smart speaker are the two main portals for voice assistants. Apple and Google lead in the smartphone market, and Amazon leads in the smart speaker market.[650] According to one consulting firm, of the 1.1 billion shipments of virtual assistants in 2019, Apple's Siri (35%) has the highest market share globally, followed by Google Assistant (9%) and Amazon Alexa (4%).[651] Although a significant share of shipments is attributed to Microsoft Cortana (22%) because of the popularity of Windows PCs globally, Cortana is generally not considered a voice assistant platform.[652]

Market participants emphasize that smart speakers represent an essential "hub" or gateway for smart homes and are driving voice-assistant adoption.[653] Smart speakers are estimated to currently have 35% U.S. household penetration, which is predicted to grow to 75% by 2025.[654] As of January 2019, Amazon had a significant lead in the U.S. market at 61.1%, followed by Google at 23.8%, Apple at 2.7%, and Sonos at 2.2%.[655]

[655] *Id.* at 7.

A voice assistant platform vendor can expand its ecosystem by adding IoT devices and voice applications. Both IoT devices and voice applications can be first-party—owned by the voice assistant platform vendor—or third-party, if the vendor has set up services to allow for manufacturers to create voice assistant-enabled devices. Amazon's Alexa ecosystem, measured in terms of compatible IoT devices and voice applications, is the largest of the three primary ecosystems. In 2017, voice assistants made their first serious moves beyond smart speakers into other product categories.[656] The voice assistant-compatible device market is vast and includes kitchen appliances, security cameras, and even trash cans.[657]

Market participants suggest there are several barriers to entry to compete with general voice assistant platforms. These include overcoming the network effects early entrants have benefited from, including financial investment in hardware, software, and infrastructure, and the ability to sell voice assistant-enabled devices at a discount.

Like many platform-based businesses, the voice assistant market benefits from network effects. The more users on a platform, the more third-party devices and applications become available, which attracts more users to the platform.[658] These network effects for voice assistant platforms are amplified by machine learning and artificial intelligence (AI). Improvements in Natural Language Processing (NLP) and AI are expected to improve the quality of voice assistants and contribute to wider adoption.[659] Voice assistant technology improves at a faster rate when there are more users providing the voice samples needed to train AI. In testimony to the Subcommittee, Professors Maurice Stucke and Ariel Ezrachi describe this a "Learning-by-Doing." As they note:

> Learning–by–doing network effect is not limited to online searches, but will be present in any environment in which algorithms evolve and adapt based on experience, such, for example, the development of voice recognition or other instances based on machine learning.[660]

[660] Data and Privacy Hearing at 6–7 (statement of Maurice E. Stucke, Prof. of Law, Univ. of Tennessee, and Ariel Ezrachi, Slaughter and May Prof. of Competition Law, Univ. of Oxford, Fellow, Pembroke Coll., Dir., Oxford Ctr. For Competition Law and Pol'y).

The scale of users generating data is arguably the most important asset in terms of AI.[661] The incumbents have access to large data sets that—when combined with machine learning and AI—position them to benefit from economies of scope in the smart home.[662]

Competing as a voice assistant platform also requires significant financial resources. A firm must make significant investments to design and train a voice assistant, as well as acquiring the physical infrastructure: hardware and cloud computing. Additionally, incumbents have also acquired various firms that specialize in voice recognition and natural language processing, a functionality that is used in their voice assistants. For example, both Apple and Amazon acquired companies to develop their core voice recognition technologies, and every incumbent has continually invested in AI startups to improve their voice assistant ecosystem.[663]

Currently, voice assistant software is built on cloud computing infrastructure. In the case of Amazon Alexa and Google Assistant, the voice assistant platforms also own the underlying cloud infrastructure, AWS, and GCP, respectively. Market participants note that advancements in voice assistant ecosystems are beginning to rely on edge computing technology, which brings the computation and data storage closer to the device and is a technology in which the incumbent cloud market leaders have a head start.[664]

Market participants have also raised concerns about incumbent firms offering voice-enabled hardware—specifically hubs such as smart speakers—to both collect large amounts of personal user data and strengthen other lines of business. At the Subcommittee's field hearing, Sonos CEO Patrick Spence explained:

> Google and Amazon have flooded the market with dramatically price-subsidized products. Indeed, they make no pretense of the fact that the products themselves are money losers and they routinely give them away at steep discounts, even for free. It is difficult to predict the impact that voice assistants will have on search and e-commerce, but voice activated speakers have the potential to dramatically alter the way that consumers interact with the internet. We believe that Google and Amazon have been willing to forgo profits in smart speakers for this reason, in addition to their ability to monetize the valuable household data that these products vacuum up. And if voice purchasing and voice search do become the next big thing, they will own the market because their strategy is succeeding. Those two companies now control roughly 85% of

[663] *See, e.g.*, *How Big Tech Is Battling To Own the $49B Voice Market*, CB INSIGHTS (Feb. 13, 2019), https://www.cbinsights.com/research/facebook-amazon-microsoft-google-apple-voice/.

[664] FUTURE TODAY INST., 2020 TECH TRENDS REPORT (2020), https://futuretodayinstitute.com/2020-tech-trends/.

the U.S. smart speaker market . . . It's not because their hardware businesses are profitable in and of themselves.[665]

As the voice assistant market expands, it may be difficult for users to switch between platforms. Because voice assistant platforms are not always interoperable, users would incur costs to purchase one or more new devices. Moreover, voice assistant technology is designed to learn its user's preferences over time. These preferences range from settings like billing information and default services for responding to music commands to more advanced learning like past voice commands and shopping history. As a voice assistant improves its "understanding" of its user, it may increase the costs associated with switching to another platform. As one market participant noted in a submission to the Subcommittee, "the user may become more dependent on that particular voice assistant and be far less likely to use a rival voice assistant that has not yet 'caught up' with the user's preferences."[666]

The design of most voice assistants—specifically on screenless devices—amplifies the ability of voice assistant platforms to favor their services as a default or as a response with limited choice.[667] This dynamic makes it easier for popular voice assistants to favor their first-party services.

There is also a significant potential for misuse of data to harm competition or consumers. Similar to other platforms, such as cloud and operating systems, voice assistant platforms collect and store users' interactions with the voice assistant.[668] During the investigation, several companies shared concerns that voice assistant platforms would be able to use this vantage to glean competitive insights from third-party voice applications or smart appliances that are performing well. As a result, platforms could use that data to acquire competitive threats or integrate their features into the company's product.

Privacy and data experts have also commented that the smart home ecosystem is some of the most sensitive data that can be collected.[669] Voice assistant platforms not only record voice interactions, but also receive information about the skills used—"whether a light is on or off. Or, if a customer links Alexa to a third-party calendar skill, Alexa may receive information about the events on the customer's calendar."[670] This raises significant concerns regarding whether a person has provided consent to data collection. Voice assistants not only collect information on the primary user, but also people in their environment, including children.

[670] Innovation and Entrepreneurship Hearing at 40 (response to Questions for the Record of Nate Sutton, Assoc. Gen. Counsel, Competition, Amazon.com, Inc.).

Finally, leaders in the voice assistant ecosystem set the rules for third parties. To make a voice assistant enabled device, market participants must comply with voice assistant platform vendor specifications. As Mr. Spence of Sonos noted in his testimony before the Subcommittee:

> To gain access to their platforms and integrate with their services, these companies issue all manner of take-it-or-leave-it demands, from early and technically detailed access to our product roadmaps, to proprietary business data, including sales forecasts, to waivers of essential contractual rights.[671]

The Subcommittee also heard from multiple voice assistant developers that have struggled to gain access to key functionality needed to build their applications, such as the unprocessed user commands.[672] While still developing, the voice assistant market shows early signs of market concentration.

I. Web Browsers

A web browser is software that retrieves and displays pages from the Internet. People often use browsers to navigate to and spend time on websites and to search the web. Most other activities online, whether it is on a mobile phone or a television screen, are made possible through a browser.[673]

Behind every browser is a "browser engine," also known as a layout engine or rendering engine. A browser engine is the central software component of a web browser, transforming content hosted on web servers into a graphic depiction that people can interact with. Browsers interpret control codes within web pages, which indicate the structure of the data, such as the beginning and end of an item, and the way to present it to the user, such as headings, paragraphs, lists, or embedded images. The browser engine takes this code to "draw the web page" on the user's screen and noting which parts of it are interactive. The non-engine components of the browser typically include the menus, toolbars, and other user-facing features, which are layered over top of the engine.[674]

Browsers abide by standards to ensure that anyone can properly use features within a website on any browser. For example, standards such as CSS and XML help ensure that a website functions the same in every browser.[675] Web browser standards organizations include the World Wide Web Consortium (W3C), Web Hypertext Application Technology Working Group (WHATWG), and

[674] *Id.* at 4.

[675] *Standards*, W3C, https://www.w3.org/standards/ (last visited on Sept. 26, 2020).

Internet Engineering Task Force (IETF). Through these organizations, stakeholders work in partnership to ensure that browser engines and web pages are interoperable.[676] W3C has become one of the most important organizations for browser standards. W3C standards undergo a rigorous review process prior to implementation.[677]

Browser vendors monetize their access to users, usually through search royalties. For example, whenever someone types a search query into the search bar on Firefox, Google records that action, and the Mozilla corporation receives a royalty.[678] Browsers also bring in ad revenues. For example, Brave sells advertisers the option to run desktop notification ads to users who choose to see ads.[679]

The browser market is highly concentrated. Google's Chrome and Apple's Safari control roughly 80% of the browser market.[680] As of August 2020, Chrome is the leader in the U.S. desktop browser market (58.6%), followed by Safari (15.8%), Edge (8.76%), Firefox (7.6%), and Internet Explorer (5.36%).[681] On mobile devices, Safari (55.5%) and Chrome (37.4%) have significant leads on their rivals, such as Samsung Internet (5.01%), Firefox (0.77%), and Opera (0.44%).[682] Additionally, the browser market has concentrated around three browser engines: Gecko, WebKit, and Blink, used in Firefox, Apple's Safari, and Google's Chrome, respectively.[683]

Google's hold on the browser market extends beyond Chrome. Google releases the code base used to make the Chrome browser as the free, open-source project Chromium.[684] Chromium is used in Microsoft's Edge browser, Amazon's Silk browser, Opera, and other browsers that are often referred to as "Chromium-based."[685] Similarly, Apple extends its power by mandating that all browser applications on the iPhone use Apple's browser engine, WebKit.[686]

686 Innovation and Entrepreneurship Hearing at 1–2 (response to Questions for the Record of Kyle Andeer, Vice Pres., Corp. Law, Apple Inc.).

Browser competition has also led to the creation of a browser extension submarket. A browser extension adds additional features to a web browser, including user interface modifications and ad-blocking. They can also provide for niche browser customization and experimentation of new functionality before it is implemented into the main browser functionality.[687] Popular add-ons include ad blockers, LastPass, and Grammarly.[688]

Competition in this market is important to promoting innovation online. In a submission to the Subcommittee, a market participant explained:

> Competing browser engines push each other for innovations in raw performance in several respects, including faster rendering, greater reliability, and a number of other technical improvements; this competition is qualitatively different from, and greater than, competition over just the browser product.[689]

Browser diversity is also important for ensuring an open internet and reduces the risk that web developers will build sites optimized for the leading engine as opposed to web standards.[690] Moreover, as developers work on advancing browser engine technology, they create technologies that can improve the overall internet ecosystem. For example, Rust is a programming language that Mozilla engineers developed while writing the Servo layout technology for browser engines.[691] Developers use Rust for other applications today, including gaming, operating systems, and other new software applications.[692] There is a general concern that without vibrant competition this form of innovation will suffer, discouraging the development of new browser engine technology.[693]

Browsers protect their dominance through default settings, which create a barrier to entry.[694] Defaults exist in both desktop and mobile markets. Although users can set different browsers more easily for desktop computers than on mobile devices, "settings can impact the stickiness over time," such as when a software update overrides a user's preference, requiring them to take "complex steps to restore their browser choice."[695] In some cases, consumers are unable to delete the preloaded browser. For example, on Apple iOS devices and Facebook's Oculus, users are unable to delete the preloaded

browser. Some popular mobile applications can preset webpage links to a predetermined browser, such as the Apple Mail App (Safari) and the Search widget on an Android device (Chrome).[696]

J. Digital Advertising

There are two principal forms of digital advertising: search advertising and display advertising. Search advertising refers to digital ads on desktop or mobile search engines, such as the Google.com homepage, displayed via "search ad tech" alongside search engine results. Search advertising is often bought and sold via real-time bidding (RTB) auctions among advertisers, where advertisers set the prices they are willing to pay for a specific keyword in a query.[697] Display advertising refers to the delivery of digital ad content to ad space on websites and mobile apps, which is referred to as "inventory." Like search advertising, buying and selling display ads often involves real-time bidding.[698]

Within display advertising, there are two separate "ad tech" markets that Subcommittee staff reviewed during the investigation: first-party and third-party. "First-party" platforms refer to companies such as Facebook, Twitter, and Snap, which sell ad space on their own platforms directly to advertisers. Google also uses first-party ad tech to sell display ads on its own properties, most notably YouTube. Third-party display ad tech platforms are run by intermediary vendors and facilitate the transaction between third-party advertisers, such as the local dry cleaner or a Fortune 500 company, and third-party publishers, such as *The Washington Post* or a blog.[699] Third-party ad tech providers include Google, Flashtalking, Sizmek (owned by Amazon), and the Trade Desk, among others.[700]

Software in display ads is programmatic, meaning that specialized software automates the buying and selling of digital ads. Market participants explain that this automated approach provides greater liquidity, better return-on-investment metrics, more precise ad targeting, and lower transaction costs. One major drawback, however, is that this process lacks transparency.[701] Google, specifically, "does not disclose to the publishers on the other ends of these trades what their space ultimately sold for and how much Google keeps as its share."[702] As another market participant told Subcommittee

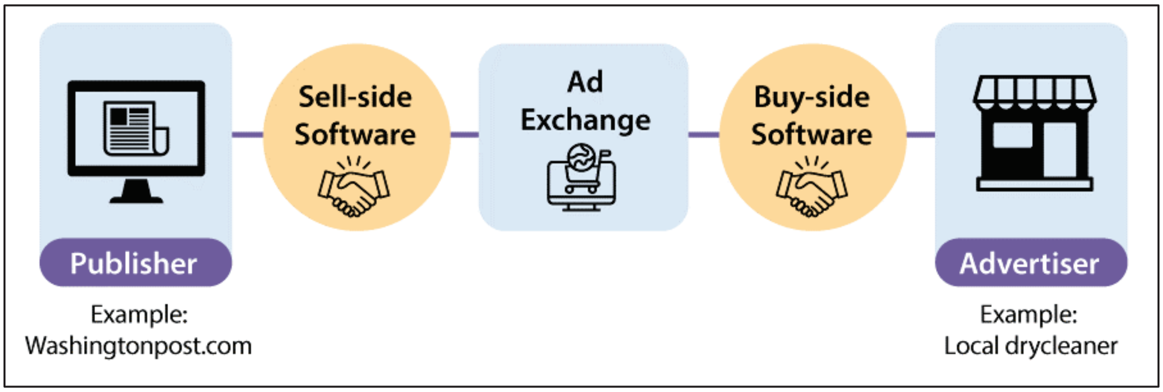
[702] *Id.* at 8.

staff, Google could make the process "more transparent," but given Google's financial stake in maintaining secrecy, "there is no incentive to."[703]

The Ad-Tech Suite[704]



Ad exchanges refer to the "ad trafficking system that connects advertisers looking to buy inventory with publishers selling inventory."[705] Sales on ad exchanges occur primarily through: (1) open real-time bidding auctions; (2) closed real-time bidding auctions; or (3) programmatic direct deals.[706]

Sell-side software includes publisher ad servers.[707] The primary function of a publisher ad server is to fill ad space on a publisher's website that is personalized to the interests of a specific website viewer.[708] Sell-side software also includes ad networks, which aggregate ad inventory from many different publishers and divide that inventory based on user characteristics—such as age or location. Ad networks sell the pool of inventory through ad exchanges or demand-side platforms (DSPs).[709]

Buy-side software includes advertiser ad servers, software that stores, maintains, and delivers digital ads to the available inventory. Ad servers facilitate the programmatic process that makes instantaneous decisions about which ads to display on which websites to which users and helps executes to display the ad on that site. Ad servers collect and report data, such as ad impressions and

[709] *Id.* at 9.

clicks, for advertisers to monitor ad performance and track conversion metrics.[710] Buy-side software also includes demand-side platforms, software that allows advertisers to buy advertising inventory from a range of publishers. Demand-side platforms use data to create targeted ad audiences and engage in purchasing and bidding.[711]

The ad tech suite also includes analytics tools that allow advertisers and publishers to measure ad campaign efficiency, including consumers' interactions with an ad. Similarly, data management platforms (DMPs) aggregate and store consumer data from various sources and process the data for analysis. Advertisers and publishers use data management platforms to track, partition, and target consumer audiences across websites.[712]

Over the last decade, the digital advertising market has experienced double-digit year-over-year growth. The market, however, has become increasingly concentrated since the advent of programmatic trading. In 2017, *Business Insider* reported that Google and Facebook accounted for 99% of year-over-year growth in U.S. digital advertising revenue.[713] Today, advertisers and publishers alike have few options when deciding how to buy and sell online ad space.[714]

Market participants suggest this concentration likely exists in part due to high barriers to entry. Google and Facebook both have a significant lead in the market due to their significant collection of behavioral data online, which can be used in targeted advertising. Additionally, Google and Facebook do not provide access to this unique data in open data exchanges. Advertisers' only access to this information is indirect—through engagement with Google and Facebook's ad tech.[715]

Amazon's advertising business is starting to obtain a portion of the U.S. year-over-year digital advertising revenue growth.[716] Amazon has been able to enter the market because it has its own trove of user data—namely, competitively significant first-party data related to retail searches and purchases. Moreover, Amazon's 50% penetration across U.S. households and its reach with high-income customers are likely to help drive its ad revenue growth.[717] While Amazon can leverage its ecosystem to overcome some of the barriers to entry in ad tech, the recent U.K. Competition and Markets

Authority report found that, as of today, Amazon's ad tech likely only has advantages in the retail sector.[718]

V. DOMINANT ONLINE PLATFORMS

A. Facebook

1. Overview

Founded in 2004 by Mark Zuckerberg, Eduardo Saverin, Chris Hughes, and Dustin Moskowitz,[719] Facebook is the largest social networking platform in the world. Its business operates around five primary product offerings, including: (1) Facebook, a social network platform; (2) Instagram, a social network app for photos and videos; (3) Messenger, a cross-platform messaging app for Facebook users; (4) WhatsApp, a cross-platform messaging app; and (5) Oculus, a virtual reality gaming system.

Facebook reported in July 2020 that its platform includes 1.79 billion daily active users (DAUs),[720] 2.7 billion monthly active users (MAUs),[721] and an average revenue per user (ARPU) of $7.05.[722] Last year, Facebook's businesses collected about $70 billion in revenue—a 27% increase from the prior year—earning about $24 billion in income from its operations.[723] Facebook reported that its family of products—including Facebook, Instagram, Messenger, and WhatsApp—includes 2.47 billion daily active people (DAP),[724] 3.14 billion monthly active people (MAP), and a family average revenue per person (ARPP) of $6.10.[725]

In addition to the Subcommittee's investigation of Facebook's monopoly power, state and federal antitrust authorities are investigating Facebook for potential violations of the U.S. antitrust laws. In July 2019, Facebook disclosed that the Federal Trade Commission (FTC) had opened an

AR_003423

antitrust investigation of Facebook in June 2019.[726] Facebook also disclosed that in July 2019 the Department of Justice announced that it would begin an antitrust review of market-leading online platforms.[727] In September 2019, New York Attorney General Letitia James announced that she joined with eight other attorneys general to lead a multistate investigation of Facebook, Inc.[728] In October 2019, Attorney General James reported that the investigation into Facebook grew to include 47 attorneys general.[729]

2. Social Networking

a. Market Power

Facebook has monopoly power in the market for social networking.[730] According to internal documents produced by Facebook to the Committee, it has high reach, time-spent, and significantly more users than its rivals in this market. Despite significant changes in the market—such as the advent of mobile devices, applications, and operating systems—Facebook has held an unassailable position in the social network market for nearly a decade, demonstrating its monopoly power.[731]

Facebook's monopoly power is firmly entrenched and unlikely to be eroded by competitive pressure from new entrants or existing firms. Documents produced during the investigation by Facebook, including communications among its senior executives on market strategy, as well as a memorandum by a senior data scientist and economist at Facebook,[732] support the conclusion that Facebook's monopoly is insulated from competitive threats. The social network market has high entry barriers—including strong network effects, high switching costs, and Facebook's significant data advantage—that discourage direct competition by other firms to offer new products and services.[733]

[729] Press Release, N.Y. Attorney General, Attorney General James Gives Update On Facebook Antitrust Investigation (Oct. 22, 2019), https://ag.ny.gov/press-release/2019/attorney-general-james-gives-update-facebook-antitrust-investigation.

[730] Facebook has argued to other antitrust enforcement bodies that limiting the product market to social networks at the exclusion of other markets, such as user attention, "would be artificial and would not reflect the competitive realities," and that "competitive pressures to which Facebook reacts are global in nature." *See, e.g.*, Production of Facebook, to H. Comm. on the Judiciary, FB-HJC-ACAL-00012074 (2016) (White Paper on Relevant Markets and Lack of Dominance for Federal Cartel Office) (on file with Comm.).

[731] Omidyar Network Report.

[732] Cunningham Memo ("Facebook has high reach and time-spent in most countries. User growth is tracking internet growth: global reach is roughly stable.").

[733] Instead of competing directly with Facebook, such as Google attempted but failed to do with Google+, other social platforms provide niche products with social graphs that are orthogonal to Facebook's graph. *See id.* at 4; FB-HJC-ACAL-

Facebook has also maintained and expanded its dominance through a series of acquisitions of companies it viewed as competitive threats, and selectively excluded competitors from using its platform to insulate itself from competitive pressure. Together, these factors have tipped the social networking market toward a monopoly.[734]

Several antitrust enforcement agencies have examined Facebook's monopoly in recent years and reached similar conclusions. In July 2020, the United Kingdom's Competition and Markets Authority (CMA) found that Facebook is dominant in the markets for social networks and digital display ads, and that its market power "derives in large part from strong network effects stemming from its large network of connected users and the limited interoperability it allows to other social media platforms."[735] In July 2019, Germany's Federal Cartel Office (Bundeskartellamt) found that "Facebook is the dominant company in the market for social networks," and that in Germany's social network market, "Facebook achieves a user-based market share of more than 90%."[736] And in June 2019, the Australian Competition & Consumer Commission (ACCC) found that "Facebook has substantial market power in a number of markets and that this market power is unlikely to erode in the short to medium terms."[737]

Facebook's responses to the Committee's requests for information claimed that it competes in a "rapidly evolving and dynamic marketplace in which competition is vigorous," citing Twitter, Snapchat, Pinterest, and TikTok as examples of competition Facebook faces for "every product and

00111394 ("Linkedin, and Nextdoor coexist in the US with similar userbases but orthogonal graphs: Facebook connects friends and family, LinkedIn connects coworkers, Nextdoor connects neighbors.").

[734] *See* Bundeskartellamt, B6-22/16, Case Summary, *Facebook, Exploitative business terms pursuant to Section 19(1) GWB for inadequate* data processing, 8 (Feb. 15, 2019) ("The facts that competitors can be seen to exit the market and that there is a downward trend in the user-based market shares of the remaining competitors strongly indicate a market tipping process which will result in Facebook.com becoming a monopolist."), https://www.bundeskartellamt.de/SharedDocs/Entscheidung/EN/Fallberichte/Missbrauchsaufsicht/2019/B6-22-16.pdf?__blob=publicationFile&v=4.

[735] Competition & Mkts. Auth. Report at 26.

[736] In addition to Facebook's high market share, the Bundeskartellamt also found that Facebook has market power based on other measures, including its "access to competitively relevant data, economies of scale based on network effects, the behaviour of users who can use several different services or only one service and the power of innovation-driven competitive pressure were seen as relevant factors of market power." Press Release, Bundeskartellamt, Bundeskartellamt prohibits Facebook from combining user data from different sources 4 (Feb. 7, 2019), https://www.bundeskartellamt.de/SharedDocs/Publikation/EN/Pressemitteilungen/2019/07_02_2019_Facebook_FAQs.pdf?__blob=publicationFile&v=6. The Bundeskartellamt also noted that in terms of assessing market share by time spent on the network, "the Facebook group would have a combined market share far beyond the market dominance threshold pursuant to Section 18(4) GWB, even if YouTube, Snapchat, Twitter, WhatsApp, and Instagram were included in the relevant market." *Id.* at 6.

[737] Austl. Competition & Consumer Comm'n Report at 9; 78 (adopting a broader view on Facebook's product market to include Twitter and Snapchat).

service" that it offers.[738] According to Facebook, its users "have many choices and can leave Facebook if they're not happy,"[739] allowing people to quickly abandon it. The ability of users to "explore the myriad other options available . . . creates strong competition for every product and service Facebook offers, as well as pressure to develop new products to attract and retain users."[740]

In response to other antitrust inquiries, Facebook said that it competes for users' attention broadly.[741] In a 2016 white paper prepared in response to an investigation by Germany's Federal Cartel Office, Facebook stated that it "faces intense competition for user attention and engagement at every level," listing companies as diverse as Candy Crush and Clash of the Clans—popular mobile gaming apps—along with YouTube, Twitter, Pinterest, Snapchat and others as competitors for users' attention.[742] Facebook similarly submitted to the ACCC that if the company does not compete vigorously, users will go to other "platforms, websites, apps, and other services—not just social media services—that compete for their attention."[743] In an interview conducted by Subcommittee staff, a former employee explained that as a product manager at Facebook, "your only job is to get an extra minute. It's immoral. They don't ask where it's coming from. They can monetize a minute of activity at a certain rate. So the only metric is getting another minute."[744]

Facebook describes a diverse list of other firms as competitive substitutes for Facebook, including Microsoft's Bing, a search engine; Yelp, a publisher of crowd-sourced business reviews; and BuzzFeed, a digital news publisher.[745] According to Facebook, these firms exert competitive pressure on Facebook in the market for users' attention.[746] Most recently, in response to an inquiry by the United Kingdom's Competition and Markets Authority, Facebook calculated its market share as "time captured by Facebook as a percentage of total user time spent on the internet, including social media, dating, news and search platforms."[747] Based on these measures, Facebook concluded that it lacks monopoly power.

[747] Competition & Mkts. Auth. Report at 121 n.152.

Facebook's position that it lacks monopoly power and competes in a dynamic market is not supported by the documents it produced to the Committee during the investigation. Instead, Facebook's internal business metrics show that Facebook wields monopoly power. In response to a supplemental information request by Subcommittee staff,[748] Facebook produced industry updates prepared in the ordinary course of business by Facebook's Market Strategy team.[749] It has described these reports as both "internal competitive metrics" and as a "competitive survey regularly prepared for Facebook's management team [that] tracks a variable set of competitors not by specific products or features, but by the degree of user attention and engagement that they command in terms of monthly active users ('MAU') and daily active users ('DAU')."[750]

Facebook's industry updates were shared internally with senior executives, including Mark Zuckerberg, Facebook's CEO.[751] Facebook used data collected through Onavo, a virtual private network (VPN) app, to provide detailed competitive insights into the usage and engagement of other firms.[752] Facebook also relied on this data in response to inquiries by the European Commission and the Bundeskartellamt,[753] as well as to prepare detailed internal reports on market strategy.[754]

i. Usage and Reach

Facebook has monopoly power in the social networking market. Based on its internal documents, Facebook and its family of products—Facebook, Instagram, Messenger, and WhatsApp—control a significant share of users and high reach in the social networking market.[755] Facebook's family of products includes three of the seven most popular mobile apps in the United States by monthly active persons, reach, and percentage of daily and monthly active persons.[756]

---

[748] Subcommittee staff made a supplemental request after identifying Facebook's industry updates during the review of documents produced in response to the Committee's September 2019 request for information.

[752] Although it does not include data from users of Apple's iMessage, which is relevant for purposes of usage on WhatsApp and Messenger, Facebook's documents note that iMessage's growth is limited by the adoption of iPhones, whereas Facebook's products can be used across different devices. *See generally* Cunningham Memo at 15.

[753] Production of Facebook, to H. Comm. on the Judiciary, FB-HJC-ACAL-00012090 (2016) (on file with Comm.).

[754] Cunningham Memo at 9 (citing data from MINT, another name used for Onavo within Facebook, Inc.).

[755] *Id.* at 2, 16 ("Facebook has high reach and time-spent in most countries. User growth is tracking internet growth: global reach is roughly stable.").

[756] Production of Facebook, to Comm. on the Judiciary, 38 (Jan. 2020) (Monthly Update for December 2019) (based on Facebook's internal calibrations of App Annie data) (on file with Comm.). According to Facebook, monthly active persons (MAP) is "based on the activity of users who visited at least one of Facebook, Instagram, Messenger, and WhatsApp (collectively, our 'Family' of products) during the applicable period of measurement." *See* Facebook, Inc., Quarterly Report (Form 10-Q) 29 (Apr. 30, 2020), http://d18rn0p25nwr6d.cloudfront.net/CIK-0001326801/bfe31518-2e18-48fb-8d98-5e8b07d94b2a.pdf-.

As a standalone product, the Facebook app had *the third highest reach* of all mobile apps,[757] with 200.3 million users in the United States, reaching 74% of smartphone users as of December 2019.[758] Facebook Messenger had the *fourth highest reach*, with 183.6 million monthly active persons, reaching 54.1% of U.S. smartphone users.[759] Finally, Instagram had the *sixth highest reach,* with 119.2 million users, reaching 35.3% of smartphone users.[760] In contrast, Snapchat, the mobile app with the seventh highest reach, had 106.5 million users in the United States, reaching 31.4% of smartphone users.[761]

Facebook's maintenance of these high market shares over a long time period demonstrates its monopoly power.[762] From September 2017 to September 2018, Facebook reached more than 75% of users internationally with at or near 100% market penetration in nine of the twenty most populous countries in the world.[763] In the United States, Facebook alone reached more than 75% of internet users during this period, while Messenger and Instagram both achieved significant reach as well.[764] According to a white paper prepared by a senior data scientist and economist at Facebook, the Facebook app has high reach in most countries, and its growth is in line with that of the Internet, whereas Instagram and WhatsApp are still growing "very rapidly."[765] For Instagram, "there appear to be ***no*** countries in which growth has hit a ceiling."[766]

Facebook's family of products are more immersive of users' attention.[767] According to Facebook's internal market data, its users spend significantly more time on its family of products than

---

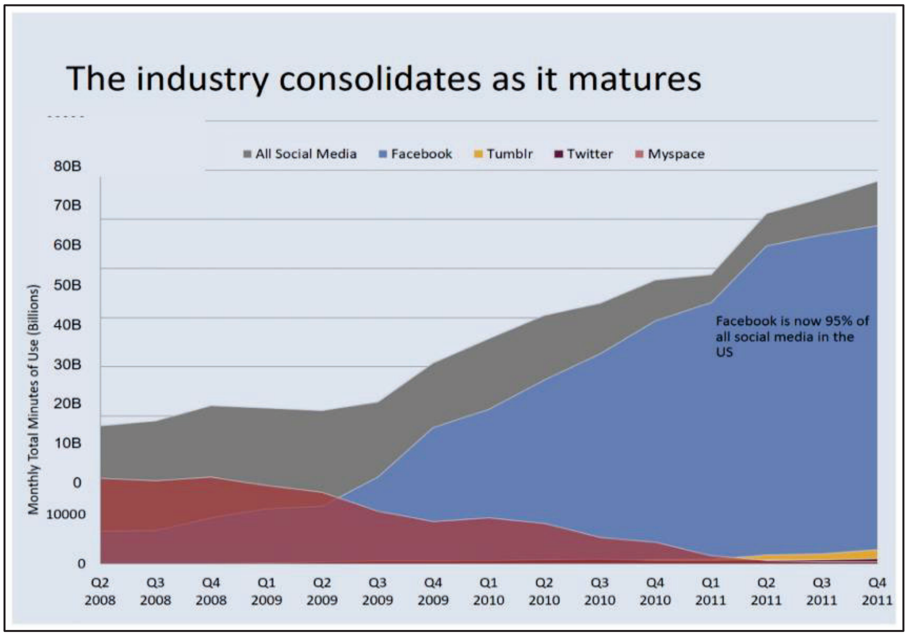
on competing services. For example, social media users spent more time on Facebook (48.6 minutes) than on Snapchat (21 minutes) or Twitter (21.6 minutes) in 2018.[768]

Since at least 2012, Facebook's documents show that Facebook believed it controlled a high share of the social networking market.[769] In a presentation prepared for Sheryl Sandberg, Facebook's Chief Operating Officer, to deliver at a large telecommunications firm, Facebook said that it controlled "95% of all social media" in the United States in terms of monthly minutes of use—as compared to Twitter, Tumblr, Myspace, and all other social media—and noted that the "industry consolidates as it matures."[770]

Facebook Investor Presentation[771]



A 2012 investor presentation prepared for Facebook described it as having an "enduring competitive advantage" similar to other historically dominant firms.[772] According to this document, which was reviewed and edited by Facebook's Chief Financial Officer to present to investors,[773] Facebook had nearly 100% market penetration among 25-34 year-olds in the United States.[774] It also

had more than 85% penetration in certain countries.[775] As noted in the presentation, "In every country we've tipped, we have maintained that penetration."[776] This point was underscored by a suggestion in the presentation that within a decade, it would be doubtful that entrepreneurs could compete with Facebook.[777]

At the Subcommittee's sixth hearing, Subcommittee Vice Chairman Joe Neguse (D-CO) asked Mr. Zuckerberg about Facebook's monopoly power.[778] As Mr. Neguse noted, based on this evidence, "most folks would concede Facebook was a monopoly as early as 2012."[779] Since then, he added that Facebook's strategy has been to "protect what I describe as a monopoly" by acquiring, copying, or eliminating its competitors.[780] Mr. Zuckerberg responded by characterizing the social networking market as "a very large space."[781] However, Facebook did not corroborate this claim through the evidence it produced during the investigation.

Lastly, after reviewing relevant market data and documents provided during the investigation, the Subcommittee found that there are distinct, relevant markets for social networking and social media. Facebook proposes that online services with social functions, such as YouTube, are social networks that compete in the same product market as Facebook and its other products for user attention.[782] For example, in a white paper submission, Facebook compares its News Feed, which includes a stream of posts and videos uploaded by users, as similar to the content feed that users encounter on YouTube.[783] However, longstanding antitrust doctrine describes relevant product markets as those that are "reasonably interchangeable by consumers for the same purposes."[784] Although YouTube is a dominant social app, it is primarily used to consume video content online. It does not provide the core functionality of Facebook or its family of products, such as Pages, Marketplace, or limited sharing within a person's network.

Report at 117–18 ("[T]he closeness of competition between different platforms depends on the degree to which consumers consider them substitutes, rather than the extent to which they share common functionalities.").

The United Kingdom's Competition and Markets Authority reached a similar conclusion, finding that YouTube is primarily a market for consuming video content rather than a market for communication.[785] As it noted, "consumers seem to access YouTube for particularly distinctive reasons . . . YouTube does not currently appear to compete closely with Facebook's platforms, despite its comparable reach and levels of consumer engagement."[786] Internal documents produced to the United Kingdom bolstered this finding, indicating "that the most common reasons consumers in the UK access YouTube are for entertainment and to view 'how-to' videos on the platform."[787]

ii. Barriers to Entry

Facebook's persistently high market share is not contestable due to high barriers to entry that discourage competition. These barriers to entry include its strong network effects, high switching costs for consumers, and data advantages.

1) Network Effects

Facebook's significant reach among users, and high levels of engagement, create very strong network effects.[788]

As a result, Facebook has tipped the market in its favor,[789] primarily facing competitive pressure from within its ***own*** family of products—such as through Instagram competing with Facebook or WhatsApp competing with Messenger—rather than actual competition from other firms in the market.[790] This finding is supported by Facebook's documents and internal analysis. These include a

790 *See, e.g.*, Cunningham Memo at 7 ("Messenger and WhatsApp clearly compete for time-spent."). While Facebook's overall penetration and network effects are high in the United States and across many other large countries, Facebook appears to have intermediate reach in some countries due to differing levels of adoption among users of certain ages. *Id.* at 12 ("In Japan and South Korea Facebook has significantly higher penetration among youth than among elderly. The role of an intergenerational social network is partly filled by other apps (LINE and Kakao).").

memorandum on Facebook's family of products prepared in October 2018 by Thomas Cunningham, a senior data scientist and economist,[791] as well as communications among senior executives.[792]

Mr. Cunningham's 2018 memorandum on "Possible End States for the Family of Apps" is an analysis of user trends among Facebook's products and other competitors.[793] It is based on the company's Onavo data from September 2017 to September 2018.[794] It was prepared for review by Facebook's senior executives, including Mr. Zuckerberg and Mr. Olivan, Facebook's Director of Growth.[795] The Subcommittee's staff interviewed a former senior employee at the company who attended meetings preparing the document for presentation to Mr. Zuckerberg and Mr. Olivan. The former employee noted that "this specific working group—and Tom Cunningham's work in particular—was guiding Mark's views" on the company's growth strategy.[796] The former employee explained the purpose of the Cunningham Memo:

> The question was how do we position Facebook and Instagram to not compete with each other. The concern was that Instagram would hit a tipping point . . . There was brutal in-fighting between Instagram and Facebook at the time. It was very tense. It was back when Kevin Systrom was still at the company. He wanted Instagram to grow naturally and as widely as possible. But Mark was clearly saying "do not compete with us." . . . It was collusion, but within an internal monopoly. If you own two social media utilities, they should not be allowed to shore each other up. It's unclear to me why this should not be illegal. You can collude by acquiring competitors and forbidding competition.[797]

The Cunningham Memo characterized the network effects of Facebook, WhatsApp, and Messenger are "very strong."[798] The memorandum notes that social apps have tipping points such that "either everyone uses them, or no-one uses them."[799] Importantly, it distinguishes between apps with a social graph that are used for broadcast sharing and messaging—Facebook, Instagram, Messenger,

WhatsApp, and Snapchat—and social apps for music or video consumption, such as YouTube or Spotify.[800] In contrast, non-social apps "can exist along a continuum of adoption."[801]

Network effects and tipping points are particularly strong in messaging apps. Because WhatsApp and other regional messaging apps have bimodal distribution of reach in countries—an all-or-nothing reach at above 90% or below 10%—messaging tends toward consolidation and market tipping.[802] Most countries have a single messaging app or protocol because they cannot support multiple messaging apps."[803] As a result of this dynamic, there are "tradeoffs in time-spent between Messenger and WhatsApp,"[804] demonstrating "very strong tipping points."[805]

Facebook already has high reach in many countries,[806] including the United States, so a primary concern addressed in Mr. Cunningham's "Possible End States" memorandum is whether cross-app sharing among Facebook's family of products poses a competitive threat to its flagship product, the Facebook app.[807] While the Cunningham Memo concluded that it is unclear whether Instagram and Facebook can coexist, it is much less concerned with Facebook's user loss due to cannibalization by Instagram than with market tipping (i.e., Instagram tipping the market in its favor and Facebook rapidly losing value due to negative or reverse network effects). It notes:

> The most important concern should be network effects, not within-user cannibalization. We have reviewed many studies which estimate cannibalization among apps for individual users, all of which find positive incrementality across the family: i.e. when a user increases their use of one app, they tend to decrease their use of other apps, but the total family effect is positive. This should not be surprising - it is unlikely that any of

---

[800] To underscore this point, the Cunningham Memo does not characterize YouTube as a direct competitor, noting that YouTube would only be a danger if it "becomes more social." Cunningham Memo at 16.

[801] *Id.* at 9.

[802] *Id.* at 10, 14 ("Most countries have a single messaging app with 70%+ daily reach. The most common app is WhatsApp. Others include Messenger, LINE, and Kakotalk.").

[803] *Id.* at 3.

[804] *Id.*

[805] *Id.* at 12 ("WhatsApp does very well when it is the market-leader (in many Latin American countries WhatsApp has nearly 90% daily reach and users spend 60 minutes/day), this suggests that it would be worth a substantial investment to try to push WhatsApp over its tipping point in other countries."). An exception to this trend appears to be where a messaging app exists as part of a social network—such as messaging services on Snapchat—but these apps operate with reduced reach. Another exception is in markets with high penetration by Apple's iPhone, but this growth is limited by adoption of iPhones since iMessage is its native app. *Id.* at 15.

[806] *Id.* at 16 ("Facebook has high reach and time-spent in most countries. User growth is tracking internet growth: global reach is roughly stable. DAP is showing weakness in developed countries and especially teens.").

[807] The Cunningham Memo refers to Facebook's flagship product as "Facebook-Blue" or "Blue" as a reference to the app's color. *Id.* at 15. There is overlap and cross-use among Facebook's products in the United States. While 40% of Instagram users' friends are also their friends on Facebook, only 12% of Facebook users' friends are "reciprocal follows" on Instagram. *Id.* at 9.

> our apps are perfect substitutes for an individual user. However a serious concern is network effects: when you use an app less, that makes it less appealing to other people, and at certain times and places those effects could be very large.[808]

As a result of this dynamic, even though there may be several social apps that exist in an ecosystem, they are unlikely to gain traction among users once a firm has tipped the market in their favor or is otherwise dominant. As the study notes, while mobile phone users tend to use five different social maps in a month, they only use "1.5 messaging apps and 1 social app, out of 10 total apps per day."[809]

Facebook's executives—including Mr. Zuckerberg—have extensively discussed the role of network effects and tipping points as part of the company's acquisition strategy and overall competitive outlook. For example, Mr. Zuckerberg told the company's Chief Financial Officer in 2012 that network effects and winner-take-all markets were a motivating factor in acquiring competitive threats like Instagram. He said:

> [T]here are network effects around social products and a finite number of different social mechanics to invent. Once someone wins at a specific mechanic, it's difficult for others to supplant them without doing something different. It's possible someone beats Instagram by building something that is better to the point that they get network migration, but this is harder as long as Instagram keeps running as a product . . . one way of looking at this is that what we're really buying is time. Even if some new competitors springs[sic] up, buying Instagram now . . . will give us a year or more to integrate their dynamics before anyone can get close to their scale again. Within that time, if we incorporate the social mechanics they were using, those new products won't get much traction since we'll already have their mechanics deployed at scale.[810]

Mr. Zuckerberg also stressed the competitive significance of having a first-mover advantage in terms of network effects prior to acquiring WhatsApp.[811] In the context of market strategies for Messenger competing with WhatsApp, Mr. Zuckerberg told the company's growth and product management teams that "being first is how you build a brand and a network effect."[812] He also told

[808] *Id.* at 9.

[809] *Id.* at 6. A recent investor report similarly noted that although "many users access more than one social network per day, it does not appear to be at the cost of declining users or user engagements within the Facebook ecosystem." [812] *Id.*

them that Facebook has "an opportunity to do this at scale, but that opportunity won't last forever. I doubt we have even a year before WhatsApp starts moving in this direction."[813]

In 2012, the company described its network effects as a "flywheel" in an internal presentation prepared for Facebook at the direction of its Chief Financial Officer.[814] This presentation also said that Facebook's network effects get "stronger every day."[815] Around that time, prominent investors similarly noted that the social networking market had "extreme network effects," making it "increasingly hard to see a materially successful new entrant, even with all of Google's resources."[816]

2) Switching Costs

In addition to the competitive insulation resulting from strong network effects, Facebook is also unlikely to face direct competition from other firms or new entrants due to the high costs for users to switch from Facebook to a competing social network.[817]

Other social network platforms are not interoperable with Facebook. Facebook users invest significant time building their networks on Facebook. This investment includes uploading and curating photos, engaging with their friends, other users, and businesses, and otherwise interacting with their social graph.[818] To switch to another platform, Facebook users have to rebuild their social graph elsewhere. In the process, they lose access to their data—including photos, posts, and other content—

[816] Production of Facebook, to H. Comm. on the Judiciary, FB-HJC-ACAL-00086834–38 (Apr. 3, 2012) (on file with Comm.) (Citi Summary of Investment Outlook). Comscore noted in 2012 that "Facebook has proven to be a dominant global force in social networking that shows no immediate signs of slowing down." According to Comscore, Facebook was the "third largest web property in the world . . . and accounted for approximately 3 in every 4 minutes spent on social networking sites and 1 in every 7 minutes spent online around the world." FB-HJC-ACAL-00051905 (Mar. 12, 2012) (Comscore 2012 Report).

[817] Omidyar Network Report at 11 ("A very significant reason that Facebook has market power is that a user cannot change platforms and expect to be able to stay in contact with her friends. Because Facebook has a near monopoly, the vast majority of the people with whom they want to exchange feeds are likely on Facebook already. The switching cost for any one user is therefore enormous.").

[818] Production of Facebook, to H. Comm. on the Judiciary, FB-HJC-ACAL-00045349 (Feb. 15, 2014) (on file with Comm.).

along with other elements of their social graph.[819] They also have to learn how to use a new service and rebuild their network.[820] As a result, Facebook's users are effectively "locked in" to its platform.[821]

Facebook's internal documents and communications reveal that Facebook employees recognize that high switching costs insulate Facebook from competition. In 2014, Facebook's Chief Financial Officer told the company's director of growth that investors like this quality about Facebook and "the idea is that after you have invested hours and hours in your friend graph or interest graph or follower graph, you are less likely to leave for a new or different service that offers similar functionality."[822] Similarly, an internal survey prepared for Facebook's senior management team about Google+ explained that "[p]eople who are big fans of G+ are having a hard time convincing their friends to participate because . . . switching costs would be high due to friend density on Facebook."[823] And in 2012, the company indicated that people's significant time investment on Facebook building their identity and connections on the platform increased the company's "stickiness."[824]

In contrast to its public statements, Facebook has not done enough to facilitate data portability for its consumers. Facebook offers a tool called "Download Your Information," which provides users with a limited ability to download their data and upload it elsewhere. But in practice, this tool is unusable for switching purposes given that it allows users to do little other than move their photos from Facebook to Google Photos. Another barrier for switching associated with this tool is that Facebook's users can only download their data in PDF or .zip format. The result is that, while Facebook publicly claims to support data portability,[825] its users seldom leave Facebook due to the challenges of migrating their data. An interview with a former employee at the company reinforces this conclusion. As the former employee noted, this tool is behind a series of menu, explaining:

> If you hide something behind more than one menu, no one sees it and they know it. Then they advertise features that they don't expect anyone to find or use. They say: "It's data portable, you can send it to Google drive?" But who cares? They've just done it to

generate talking points. They are not allowing you to export your social graph, which is actually valuable.[826]

Leaving Facebook may create additional costs in other key respects. Switching from Facebook may degrade a person's other social apps that integrate with Facebook's Platform APIs. For example, Spotify users who signed up with Facebook "can't disconnect it."[827] To leave Facebook, they must set up a new account on Spotify.[828] In the process, they lose access to their playlists, listening history, social graph of other friends on Spotify, and their other data on the app.[829]

People who leave Facebook may also lose access to popular features on Facebook that, due to its scale and network effects, are not available on other social apps (e.g., events, marketplace, and groups).[830] For example, a church may actively maintain a Facebook page for its parishioners and not on other social apps. Furthermore, some Facebook users who believe they are switching from the company's platform may nevertheless continue using its family of products, such as Instagram or WhatsApp.[831] As the United Kingdom's Competition and Markets Authority noted, this reinforces Facebook's market power.[832]

In response to the concern about switching costs, Facebook replied that its users have meaningful choices and alternatives to Facebook.[833] Additionally, Facebook notes that its users have been able to download their data since 2010.[834] The company describes its users' ability to download their data as a "robust portability tool."[835] However, in March 2019, Mr. Zuckerberg explained that a

Facebook user's ability to download their data is not "[t]rue data portability."[836] Instead, he said its users should be able to sign in to other services in "the way people use our platform to sign into an app."[837]

Currently, Facebook's users lack the ability to port their social networks to a different platform. To switch social networking platforms, a Facebook user can import their contacts from their mobile devices, such as email addresses or phone numbers, to build a network on a different platform. But importing contacts is not a substitute for a person's social graph and, as the CMA concluded, this method is likely limited to a person's close friends.[838] In recognition of this, Javier Olivan, Facebook's Director of Growth, told the company's senior management team that information from a person's address book on their mobile device is "incomplete" because people typically only store limited information in their contacts (e.g., a person's first name, last name, and their phone number).[839] In contrast, Facebook users "have a much richer profile—which creates a much richer experience (we have data that shows how . . . profile pictures make for better / more functional [user interfaces]."[840]

3) Access to Data

Facebook has a significant data advantage in the social networking market. While data may be non-rivalrous—meaning users can provide the same piece of data to more than one platform—it creates another entry barrier, reinforcing Facebook's monopoly power.

Subcommittee staff conducted interviews with market participants that described Facebook as having nearly perfect market intelligence. Facebook's data dominance creates self-reinforcing advantages through two types of "feedback loops."[841] First, by virtue of its significant number of users, Facebook has access to and collects more user data than its competitors.[842] And second, Facebook uses this data to create a more targeted user experience, which in turn attracts more users and leads those users to spend more time on the platform.[843] In contrast, smaller platforms with less access to data must compete by providing a different user experience with less targeting capacity. Facebook's data advantage is thus compounded over time, cementing Facebook's market position and making it even more difficult for new platforms to provide a competitive user experience.

[843] *Id.*

Facebook's data advantages also provide a monetization feedback loop. Revenue generated through targeted advertising to existing users can be reinvested into the platform, thereby attracting more users. Facebook's ability to provide targeted advertising is highly valuable to advertisers and allows Facebook to monetize its service. Meanwhile, smaller entrants are less attractive to advertisers since "no de novo entrant [has] access to anywhere near the volume or quality of data" as Facebook.[844] As with its user feedback loop, Facebook's monetization feedback loop creates a runaway virtuous circle that serves as a powerful barrier to entry.

Facebook's data also enables it to act as a gatekeeper because Facebook can exclude other firms from accessing its users' data.[845] Beginning in 2010, Facebook's Open Graph provided other companies with the ability to scale through its user base by interconnecting with Facebook's platform. Some companies benefited immensely from this relationship, experiencing significant user growth from Open Graph and in-app signups through Facebook Connect, now called Facebook Login.[846] Around that time, investors commented that Open Graph gave some companies "monstrous growth," referring to it as "steroids for startups."[847] For example, documents produced by Facebook indicate that it was the top referrer of traffic to Spotify, driving 7 million people "to install Spotify in the month after [Facebook] launched Open Graph."[848] At one point, nearly all of Spotify's growth originated from Facebook, while Pinterest "grew to 10 million users faster than any standalone site in the history of the Internet."[849]

Conversely, interconnecting with the Facebook Platform also gave the company the ability to prioritize access to its social graph—effectively picking winners and losers online.[850] These tools also gave Facebook advanced data insights into other companies' growth and usage trends. For example, a daily report on metrics for Facebook Login included daily and monthly active users for companies interconnecting with Facebook, referral traffic, and daily clicks, among other metrics. As this report

noted, 8.3 million distinct sites used Facebook Connect on a monthly basis in March 2012.[851] Facebook was also able to exclude others from accessing this data.[852] As the United Kingdom's Competition and Markets Authority observed, "the inability of smaller platforms and publishers to access user data creates a significant barrier to entry."[853]

b. Relevant Acquisitions

i. Overview

Since its founding in 2004, Facebook has acquired at least 63 companies.[854] The majority of these acquisitions have involved software firms, such as Instagram, WhatsApp, Face.com, Atlas, LiveWire, and Onavo.[855] Facebook has also acquired several virtual reality and hardware companies, such as Oculus.[856] More recently, the company has acquired several niche social apps,[857] a blockchain platform,[858] Oculus game developers,[859] and a prominent GIF-making and sharing company.[860]

Facebook's internal documents indicate that the company acquired firms it viewed as competitive threats to protect and expand its dominance in the social networking market. As discussed earlier in this Report, Facebook's senior executives described the company's mergers and acquisitions strategy in 2014 as a "land grab" to "shore up our position."[861] In 2012, Mr. Zuckerberg told

861 Production of Facebook, to H. Comm. on the Judiciary, FB-HJC-ACAL-00045388 (Feb. 18, 2014), https://judiciary.house.gov/uploadedfiles/0004538800045389.pdf ("[W]e are going to spend 5-10% of our market cap every couple years to shore up our position . . . I hate the word 'land grab' but I think that is the best convincing argument and we should own that."). Mr. Wehner is currently Facebook's Chief Financial Officer. He replaced David Ebersman, Facebook's

Facebook's former Chief Financial Officer that the purpose of acquiring nascent competitors like Instagram was to neutralize competitive threats and to maintain Facebook's position. Documents show that when Facebook acquired WhatsApp, Mr. Zuckerberg and other senior executives, as well as data scientists, viewed WhatsApp as a potential threat to Facebook Messenger, as well as an opportunity to further entrench Facebook's dominance. Facebook used critical acquisitions to increase the adoption of its social graph and expand its reach in markets. Finally, Facebook's serial acquisitions reflect the company's interest in purchasing firms that had the potential to develop into rivals before they could fully mature into strong competitive threats.[862]

ii. Instagram

Instagram was founded in February 2010 by Kevin Systrom and Mike Krieger.[863] Originally launched as Burbn, a location-sharing social app,[864] the company released Instagram as a photo-sharing app for Apple iPhones in October 2010,[865] and released its app in the Google Play Store on April 3, 2012.[866]

On April 9, 2012, Facebook proposed its acquisition of Instagram for approximately $1 billion.[867] Facebook formally acquired Instagram in August 2012.[868] The Federal Trade Commission (FTC) opened an investigation into the acquisition but closed it in August 2012 without taking

[865] MG Siegler, *Instagram Launches With The Hope Of Igniting Communication Through Images*, TECHCRUNCH (Oct. 6, 2010), https://techcrunch.com/2010/10/06/instagram-launch/. The company received $500,000 in seed funding in March 2010 from Baseline Ventures and Andreesen Horowitz. It later received $7 million in another round of financing in December 2010 primarily from Benchmark Capital and Baseline Ventures. Production of Facebook, to H. Comm. on the Judiciary, FB-HJC-ACAL-00101426 (Dec. 5, 2011) (on file with Comm.) (Instagram Financial History and Projections).

[866] Production of Facebook, to H. Comm. on the Judiciary, FB-HJC-ACAL-00106124 (Apr. 13, 2012) (on file with Comm.) (Instagram Chat Log); *see also* Matt Burns, *Instagram's User Count Now at 40 Million, Saw 10 Million New Users in Last 10 Days,* TECHCRUNCH (Apr. 13, 2012), https://techcrunch.com/2012/04/13/instagrams-user-count-now-at-40-million-saw-10-million-new-users-in-last-10-days/.

[867] The transaction's value was approximately $300 million in cash and roughly $700 million in shares of Facebook at the time of the transaction. Due to changes in the company's value following the launch of its IPO, the final transaction value was worth about $300 million in cash and $460 million in Facebook stock. *See* Facebook, Inc., Quarterly Report (Form 10-Q) 9 (Sept. 30, 2012), https://www.sec.gov/Archives/edgar/data/1326801/000132680112000006/fb-9302012x10q.htm.

[868] Facebook, Inc., Annual Report (Form 10-K) 5 (Dec. 31, 2012), https://www.sec.gov/Archives/edgar/data/1326801/000132680113000003/fb-12312012x10k.htm.

action.[869] According to the FTC, "Upon further review of this matter, it now appears that no further action is warranted by the Commission at this time."[870] The letter added that the FTC's closing of the investigation "is not to be construed as a determination that a violation may not have occurred . . . . The Commission reserves the right to take such further action as the public interest may require."[871]

In the context of reports that Facebook was planning to integrate Whatsapp, Instagram, and Facebook Messenger,[872] and concerns about the company's motives for doing so,[873] a former employee of Instagram explained the ease with which Facebook and Instagram came together—and could potentially be pulled apart. They explained:

> Why can't Facebook fork the backend of the product? Facebook makes an odd argument that they use the same system. But you can just copy and paste code, make a copy of the system, and give it to the new company. If you can put them together, you can pull them apart. Facebook can always pull out the data that Instagram would not need. They spent the last year pushing the two products together, it just simply doesn't make sense that they can't work back to where they were in 2019. It's not like building a skyscraper and then suddenly needing to knock the building down again. They can just roll back the changes they've been making over the past year and you'd have two different apps again. It's not about the pipeline. It's an intangible object. You can just copy and paste. Right now, they have a switch inside the app. They could just change something from true to false and it would work. It's not building a skyscraper; it's turning something on and off.[874]

According to Facebook's internal documents, Facebook acquired Instagram to neutralize a nascent competitive threat. In 2012, Mark Zuckerberg wrote to several Facebook executives citing concerns that Instagram posed a risk to Facebook. In February 2012, he said to David Ebersman, Facebook's Chief Financial Officer, that he had "been thinking about . . . how much [Facebook] should be willing to pay to acquire mobile app companies like Instagram . . . that are building networks that

[874] Email from Former Instagram Employee (Oct. 4, 2020).

are competitive with our own."[875] Mr. Zuckerberg told Mr. Ebersman that these "businesses are nascent but the networks are established, the brands are already meaningful and if they grow to a large scale they could be very disruptive to us."[876]

In response, Mr. Ebersman asked Mr. Zuckerberg whether the goals of the acquisition would be to: (1) neutralize a potential competitor; (2) acquire talent; or (3) integrate Instagram's product with Facebook's to improve its service.[877] Mr. Zuckerberg replied that a purpose of the transaction would be to neutralize Instagram, saying that the goals of the deal were "a combination of (1) and (3)." He explained:

> One thing that may make (1) more reasonable here is that there are network effects around social products and a finite number of different social mechanics to invent. Once someone wins at a specific mechanic, it's difficult for others to supplant them without doing something different. It's possible someone beats Instagram by building something that is better to the point that they get network migration, but this is harder as long as Instagram keeps running as a product.[878]

Mr. Zuckerberg wrote that acquiring Instagram would allow Facebook to integrate the product to improve its service. But, he added, that "in reality we already know these companies' social dynamics and will integrate them over the next 12-24 months anyway."[879] He explained:

> By a combination of (1) and (3), one way of looking at this is that ***what we're really buying is time***. Even if some new competitors springs [sic] up, buying Instagram, Path, Foursquare, etc [sic] now will give us a year or more to integrate their dynamics before anyone can get close to their scale again. Within that time, if we incorporate the social mechanics they were using, those new products won't get much traction since we'll already have their mechanics deployed at scale.[880]

In March 2012, Mr. Zuckerberg told Mike Schroepfer, Facebook's Chief Technology Officer,[881] that acquiring Instagram would provide the company with "[i]nsurance" for Facebook's

[880] *Id.* (emphasis added).

[881] Mr. Schroepfer was Facebook's Vice President of Engineering at the time of the Instagram acquisition. He was elevated to Chief Technology Officer in March 2013. *See* Tomio Geron, *Facebook Names Mike Schroepfer CTO*, FORBES (Mar. 15, 2013), https://www.forbes.com/sites/tomiogeron/2013/03/15/facebook-names-mike-schroepfer-cto/#1a88880b20e3.

main product.[882] Mr. Schroepfer agreed, responding that "not losing strategic position in photos is worth a lot of money."[883] He added that the "biggest risk" would be if Facebook were to "kill" Instagram "by not investing in the company and thereby opening a window for a new entrant."[884]

In a message to another Facebook employee on April 5, 2012, Mr. Zuckerberg said that "Instagram can hurt us meaningfully without becoming a huge business."[885] In contrast, he did not view other smaller firms, such as Pinterest and Foursquare, as comparable competitive threats.[886] As he noted, if these companies "become big we'll just regret not doing them . . . Or we can buy them then, or build them along the way."[887] In an all-hands meeting the following day, Mr. Zuckerberg responded to a question about Instagram's rapid growth by saying that "we need to dig ourselves out of a hole." [888] He also told employees at the company that Instagram is "growing really quickly" and that it would be "tough to dislodge them."[889]

Following the announcement of the transaction, Mr. Zuckerberg said internally that Facebook "can likely always just buy any competitive startups," and agreed with one of the company's senior engineers that Instagram was a "threat" to Facebook.[890] Mr. Zuckerberg concluded that "[o]ne thing about startups though is you can often acquire them."[891]

At the Subcommittee's sixth hearing, Judiciary Committee Chairman Jerrold Nadler (D-NY) asked Mr. Zuckerberg about his characterization of Instagram as a competitive threat prior to the acquisition.[892] In response, Mr. Zuckerberg said that Facebook has always viewed Instagram as "both a

---

[882] Production of Facebook, to H. Comm. on the Judiciary, FB-HJC-ACAL-00063184–85 (Mar. 9, 2012), https://judiciary.house.gov/uploadedfiles/0006318000063197.pdf. These documents are consistent with reporting. Following the acquisition, Gregor Hochmuth, an Instagram engineer, was reportedly told by employees on the Facebook Camera team that "our job was to kill you guys." Following the acquisition, Instagram's employees were also reportedly told by Facebook's growth team "Instagram wouldn't get any help adding users unless they could determine, through data, that the product wasn't competitive with Facebook." [892] CEO Hearing Transcript at 43 (question of Rep. Jerrold Nadler (D-NY), Chairman, H. Comm. on the Judiciary).

competitor and as a complement to our services."[893] He added that at the time of the transaction, Instagram was a competitor in mobile photos and camera apps.[894]

Chairman Nadler also asked that if this "was an illegal merger at the time of the transaction, why shouldn't Instagram now be broken off into a separate company?"[895] In response, Mr. Zuckerberg said that "with hindsight, it probably looks obvious that Instagram would have reached the scale that it has today."[896] But he elaborated:

> It was not a guarantee that Instagram was going to succeed. The acquisition has done wildly well, largely because not just of the founders' talent but because we invested heavily in building up the infrastructure and promoting it and working on security and working on a lot of things around this, and I think that this has been an American success story.[897]

This response, however, is not consistent with many of the documents Facebook provided to the Subcommittee.[898]

Instagram was growing significantly at the time of the transaction. In December 2011, with only 13 employees, Instagram already had 14 million users.[899] Instagram's internal financial history and projections noted that it did not plan to charge for its app or for downloading filters due to its "rapid user growth" and "implied network value."[900] Instagram's internal market projections showed the company growing to nearly 20 million users by January 2012 with a 22% monthly growth rate.[901] By March 31, 2012, Instagram had 30.2 million users and a 17% user growth rate.[902] After releasing its

app in the Google Play Store on April 3, 2012, Instagram added ten million users within ten days,[903] growing to nearly 50 million users by April 30, 2012,[904] and 100 million users by the time the acquisition closed in August 2012.[905]

Instagram's growth also appeared to be sustainable. In an email between senior executives at both companies on April 16, 2012, Instagram's head of business operations said that Instagram had not had difficulties with scaling or cloud storage availability, noting that "[s]caling has been really easy" despite the need to "keep adding machine capacity."[906] They also noted that user uptake on Android devices exceeded the company's expectations, but did not raise concerns about their ability to scale in response to this demand.[907]

Facebook's support of Instagram's growth after acquiring it is overstated. Before acquiring Instagram, Mr. Zuckerberg said that Facebook should "invest a few more engineers in it" but let Instagram "run relatively independently."[908] Prior to being acquired, Instagram's internal projections showed the company gaining nearly 88 million users by January 2013,[909] and that its growth trajectory would not be significantly affected by the transaction.[910]

iii. WhatsApp

1) Overview

WhatsApp was founded in February 2009 by Jan Koum and Brian Acton.[911] Originally designed to allow users to provide temporary updates to their contacts,[912] WhatsApp is a cross-platform messaging and calling service.[913] Unlike traditional text and multimedia messages sent over a

cellular network at the time, WhatsApp messages and calls do not require a cellular connection, and are transmitted by an internet connection.[914] A main distinction between Facebook Messenger and WhatsApp is the network that people are able to communicate with on each messaging service. A Facebook user can only send messages to other Facebook users on the Messenger app, whereas a WhatsApp user can send messages to other people based on contacts on their mobile device.[915]

Until 2016, WhatsApp monetized its service through subscriptions for a nominal fee after the first year of use.[916] Around that time, WhatsApp was the only messaging app that competed using this business model.[917] Importantly, WhatsApp's founders strongly opposed an advertisement-based business model. In June 2012, they wrote that "when advertising is involved **you the user** are the product," explaining:

> Advertising isn't just the disruption of aesthetics, the insults to your intelligence and the interruption of your train of thought. At every company that sells ads, a significant portion of their engineering team spends their day tuning data mining, writing better code to collect all your personal data, upgrading the servers that hold all the data and making sure it's all being logged and collated and sliced and packaged and shipped out.[918]

WhatsApp also maintained robust privacy policies. In its June 2012 privacy policy, WhatsApp stated that it does not collect names, emails, location data, or the contents of messages sent through WhatsApp.[919] According to its policy, "WhatsApp is currently ad-free and we hope to keep it that way forever."[920]

2) Acquisition Review

On February 19, 2014, Facebook announced its proposed acquisition of WhatsApp for approximately $16 billion at the time of the announcement.[921] Following the transaction, WhatsApp's co-founder wrote that the company would "remain autonomous and operate independently" from Facebook, and that "nothing" will change for users because there "would have been no partnership between our two companies if we had to compromise on the core principles that will always define our company, our vision and our product."[922] Mr. Zuckerberg said that "[w]e are absolutely not going to change plans around WhatsApp and the way it uses user data."[923]

The Federal Trade Commission opened an initial investigation into the proposed transaction on March 13, 2014. On April 10, 2014, the FTC's Director of the Bureau of Consumer Protection sent a letter advising the companies that WhatsApp "must continue to honor" its privacy data security commitments to its users, and that "a failure to keep promises made about privacy constitutes a deceptive practice under section 5 of the FTC Act."[924] The Commission did not initiate a full-phase investigation into the acquisition.

In September 2014, the European Commission initiated a review of Facebook's proposed acquisition of WhatsApp.[925] At the time of the transaction, Facebook calculated that the combined share of Facebook Messenger and WhatsApp in February 2014 was approximately 36% of the European Economic Area (EEA) market.[926] In a filing in support of the transaction, Facebook told the European Commission that multi-homing—the use of multiple apps with similar features—was a key characteristic of the messaging market, saying that "approximately 70% of consumers use at least two, and 43% use at least three, communications apps in parallel."[927] Facebook characterized the WhatsApp

---

921 The transaction included $4 billion in cash and approximately $12 billion of Facebook shares. *Facebook to Acquire WhatsApp*, FACEBOOK (Feb. 19, 2014), https://about.fb.com/news/2014/02/facebook-to-acquire-whatsapp/. The final value of WhatsApp exceeded $21 billion due to changes in the value of Facebook's stock during the transaction and due to the addition of granting $3 billion in Facebook shares following the closing of the transaction. Sarah Frier, *Facebook $22 Billion WhatsApp Deal Buys $10 Million in Sales,* BLOOMBERG (Oct. 29, 2014), https://www.bloomberg.com/news/articles/2014-10-28/facebook-s-22-billion-whatsapp-deal-buys-10-million-in-sales.

927 *Id.* at FB-HJC-ACAL-00042160.

product market as being distinct from the social networking market because WhatsApp "does not offer social features," and represented that it had "no plans to make changes to WhatsApp's current strategy" after closing the proposed acquisition.[928]

On October 3, 2014, the European Commission approved the proposed transaction, finding that "Facebook Messenger and WhatsApp are not close competitors and that consumers would continue to have a wide choice of alternative consumer communications apps after the transaction."[929] Although the European Commission noted that the messaging apps are characterized by network effects, it concluded that Facebook would "continue to face sufficient competition after the merger."[930] The Commission acknowledged that there is overlap between social networking and messaging apps. As it noted, the distinction between these apps is "becoming blurred and each of these services adopts traditional functionalities of the other." [931] However, the Commission concluded that social networking services generally provide more social features than messaging apps—such as commenting on or "liking" other users' posts and photos—whereas messaging apps had more limited functionality that is focused on real-time communication.[932]

In 2016, the European Commission fined Facebook after it concluded that Facebook provided "incorrect or misleading information" during the Commission's review of the transaction.[933] In its Statement of Objections to Facebook, the Commission concluded that Facebook provided misleading evidence on whether the company could match its users' accounts with those of WhatsApp's users.[934] In August 2016, WhatsApp had updated its policies to allow the linking of Facebook user identities with WhatsApp user phone numbers.[935] As discussed below, Facebook intended to create this functionality at the time of the transaction.[936]

Documents obtained by the Subcommittee indicate that Facebook acquired WhatsApp to expand its dominance. Prior to acquiring WhatsApp, Facebook viewed the acquisition as providing an opportunity to expand its reach in countries with intermediate levels of penetration.[937] Facebook's

internal documents at the time of the transaction reveal that WhatsApp had already tipped markets in its favor where it had high penetration.[938]

In an internal email to Facebook's management team, Facebook Director of Growth Javier Olivan wrote that WhatsApp had higher levels of reach and usage than Facebook in countries that it had penetrated. For example, based on Facebook's internal data, WhatsApp reached 99.9% of the smartphone population in Spain, or as Mr. Olivan described it, "literally everyone."[939] By purchasing WhatsApp, Mr. Olivan suggested that they could "grow Facebook even further" by exposing new users to Facebook.[940] Additionally, by bundling free services with WhatsApp and Facebook's other services, the transaction could serve as another mechanism to expand Facebook's reach among WhatsApp users.[941] Mr. Zuckerberg responded supportively, saying that "I really agree with this analysis."[942]

In an email to David Ebersman, Facebook's Chief Financial Officer, Mr. Olivan wrote that WhatsApp's "reach amongst smartphone users is actually bigger than ours . . . we have close to 100% overlap, our user-base being a subset of theirs."[943] He explained that "in markets where they do well, they literally reach 100% of smartphone users—which is a big part of the population."[944] In the company's internal documents describing the transaction rationale, there was a heavy emphasis on WhatsApp's growth and usage—450 million users, a clear path to a billion users, and adding one million new users every day with no marketing—and expanding Facebook's social graph to phones.[945] Prior to the acquisition, Mr. Zuckerberg had requested a list of all mobile apps with more than 100 million daily and monthly active users globally.[946] Facebook's data showed that WhatsApp had the second most daily active users and fourth most monthly active users of any freestanding mobile app.[947]

Finally, a week after announcing the transaction, David Wehner, then-Vice President of Corporate Finance and Business Planning at Facebook, said to Mr. Ebersman that "we are going to spend 5-10% of our market cap every couple years to shore up our position."[948] Mr. Wehner said that

"I hate the word 'land grab' but I think that is the best convincing argument and we should own that."[949]

Other documents indicate that Facebook viewed WhatsApp as a maverick competitor. In December 2013, Mr. Zuckerberg sent an email to Facebook's management team on competitive issues facing the company. In this email, he called attention to a feature that WhatsApp had implemented on its platform, and warned that Facebook should move quickly:

> I want to call out two competitive near term issues we face. The first is WhatsApp adding a feature like this for public figures . . . If the space is going to move in this direction, being the leader and establishing the brand and network effects matters a lot. This alone should encourage us to consider this soon. . . . When the world shifts like this, being first is how you build a brand and network effect. We have an opportunity to do this at scale, but that opportunity won't last forever. I doubt we even have a year before WhatsApp starts moving in this direction.[950]

Facebook's documents also indicate that the company monitored WhatsApp closely to determine whether it was a threat to the Messenger app. Prior to consummating the merger, Facebook's data scientists used Onavo data to model WhatsApp's engagement and reach to determine whether it was "killing Facebook Messenger,"[951] as well as how its usage trends compared to Snapchat.[952]

c. Conduct

In addition to protecting and expanding its dominance by acquiring firms that Facebook identified as competitive threats over the past decade, Facebook abused its monopoly power to harm competition in the social networking market. Facebook used its data advantage to create superior market intelligence to identify nascent competitive threats and then acquire, copy, or kill these firms. Once dominant, Facebook selectively enforced its platform policies based on whether it perceived other companies as competitive threats. In doing so, it advantaged its own services while weakening other firms.

i. Facebook's Use of Non-Public Data to Identify Competitive Threats

Prior to Facebook's acquisition of Instagram, Facebook used internal data to track the growth of Instagram and other popular apps. While this data was probative for companies that interconnected

with Facebook through Open Graph, it was incomplete for studying mobile app usage trends across the entire mobile ecosystem. In April 2012, Facebook's Director of Growth Javier Olivan emailed Mr. Zuckerberg and Facebook Chief Product Officer Chris Cox, about improving Facebook's "competitive research."[953] He said that "getting our data in great shape is going to require effort."[954] Although the company had made "some good progress" using data from Comscore, a data analytics and measurement firm, Mr. Olivan said that with a significant investment, Facebook could build its own custom panel for mobile data that would "allow us to get 10x better at understanding" the mobile ecosystem:

> I keep seeing the same suspects (instagram, pinterest, …) [sic] both on our competitive radar / platform strategy as wins . . . I think having the exact data about their users [sic] engagement, value they derive from [Facebook] . . . would help us make more bold decisions on whether they are friends or foes. Back to your thread about "copying" vs. "innovating" we could also use this info to inspire our next moves.[955]

Mr. Zuckerberg responded: "Yeah, let's do it. We can find some time periodically during my weekly reviews to go over this stuff."[956]

A year later, on October 14, 2013, Facebook acquired Onavo, a virtual private network (VPN), for $115 million and other consideration.[957] In an email to Facebook's board, Facebook's Vice President and Deputy General Counsel said the purpose of the acquisition was to "enhance our analytics related to cross-app user engagement data, as well as user behavior and market trends, and also to improve advertising effectiveness through demand data and audience targeting in the long term."[958] Importantly, Facebook planned to place the incoming Onavo employees, including its cofounder, Guy Rosen, under Facebook's Growth team reporting to Javier Olivan.[959]

Facebook's acquisition of Onavo provided the company with the ability to track potential competitors through non-public, real-time data about engagement, usage, and how much time people spend on apps. Following this acquisition, Facebook used Onavo data as an "early bird warning

[959] *Id.*

system,"[960] identifying fast-growing apps that could potentially threaten Facebook's market position or enable it to protect and expand its dominance. For instance, days prior to Facebook's acquisition of WhatsApp in 2014, Facebook senior executives provided Mark Zuckerberg with a list of all mobile apps with greater than 90 million monthly active users—WhatsApp, one of the only top mobile apps not owned at the time by either Facebook or Google, was fourth on the list.[961]

In August 2018, Apple removed Onavo from its app store following reporting that Facebook was using the app to track users and other apps.[962] An Apple spokesperson said the company intended to make "it explicitly clear that apps should not collect information about which other apps are installed on a user's device for the purposes of analytics or advertising/marketing and must make it clear what user data will be collected and how it will be used."[963] In January 2019, Apple removed Facebook's functional successor to Onavo, the Facebook Research app, following reports by *TechCrunch* that Facebook paid "teenagers and adults to download the Research app and give it root access to network traffic in what may be a violation of Apple policy so the social network can decrypt and analyze their phone activity."[964]

Most recently, Facebook acquired Giphy, a platform for sharing GIFs online and through messaging apps, for $400 million in May 2020.[965] As several reporters have noted, this transaction would give Facebook competitive insights into other messaging apps. One commenter said, "While you may successfully block trackers like the Facebook ad pixel following you around online, or even delete your Facebook account, the majority of us wouldn't suspect we're being monitored when we're sending funny images to friends."[966]

ii. Facebook's Strategy to Acquire, Copy, or Kill Competitors

Facebook's internal documents indicate that once it identified a competitive threat, it attempted to buy or crush them by cloning their product features or foreclosing them from Facebook's social graph. Facebook took these steps to harm competitors and insulate Facebook from competition, not just to grow or offer better products and services.

In a March 2012 email to other senior executives at Facebook, Mr. Zuckerberg wrote that cloning other apps could help Facebook move faster by "building out more of the social use cases ourselves and prevent our competitors from getting footholds."[967] Other senior employees at Facebook agreed with this strategy. Sheryl Sandberg, Facebook's Chief Operating Officer, said that "it is better to do more and move faster, especially if that means you don't have competitors build products that takes some of our users." Sam Lessin, Facebook's Product Management Director, added, "I would love to be far more aggressive and nimble in copying competitors. . . Let's 'copy' (aka super-set) Pinterest!"[968] Another senior executive responded, "I've been thinking about why we haven't moved faster on Roger and Snap . . . I'm increasingly concerned as I watch startups siphon our graph and create awesome new experiences faster than we can."[969]

Prior to its acquisition of Instagram in 2012, Facebook's senior executives had identified Instagram as a growing threat. Mr. Zuckerberg told employees at an internal meeting that the "bad news is that [Instagram is] growing really quickly, they have a lot of momentum, and it's going to be tough to dislodge them."[970] One engineer wrote in an internal company chat that "Instagram is eating our lunch. We should've owned this space but we're already losing quite badly."[971] In response, another engineer asked, "Isn't that why we're building an Instagram clone?" referencing Facebook's development of Facebook Camera, a standalone photo app.[972]

During negotiations to acquire Instagram, Mr. Zuckerberg referenced Facebook's development of a similar app to Kevin Systrom, Instagram's Chief Executive Officer.[973] In messages between Mr. Zuckerberg and Mr. Systrom, Mr. Systrom said that it was difficult to evaluate the transaction independently of reports that Facebook was developing a similar product. He told Mr. Zuckerberg that

he "wouldn't feel nearly as strongly [about the acquisition] if independently you weren't building a mobile photos app that makes people choose which engine to use."[974] Similarly, Mr. Zuckerberg suggested that refusing to enter into a partnership with Facebook, including an acquisition, would have consequences for Instagram, referencing the product Facebook was developing at the time:

> At some point soon, you'll need to figure out how you actually want to work with us. This can be an acquisition, through a close relationship with Open Graph, through an arms length relationship using our traditional APIs, or perhaps not at all. . . Of course, at the same time we're developing our own photos strategy, so how we engage now will determine how much we're partners vs. competitors down the line—and I'd like to make sure we decide that thoughtfully as well.[975]

In an earlier conversation with Matt Cohler, an Instagram investor and former senior Facebook adviser, Mr. Systrom asked whether Mr. Zuckerberg would "go into destroy mode if I say no" to being acquired, saying that the companies "have overlap in features."[976] Mr. Cohler responded "probably" and that Mr. Zuckerberg would "conclude that it's best to crush [I]nstagram."[977]

Facebook's approach towards rival social networking app Snapchat is another case study in how Facebook enters "destroy mode" when its market position is threatened. In 2013, as the company was growing rapidly, Snapchat co-founder Evan Spiegel turned down an offer from Mr. Zuckerberg to acquire the company for $3 billion.[978] Thereafter, Instagram—owned by Facebook—introduced the Instagram Stories feature, which allows users to post content that is available for only 24 hours, and which was "nearly identical to the central feed in Snapchat, which [was] also called Stories."[979]

Less than a year after its introduction, Instagram Stories had more daily active users (200 million) than Snapchat Stories (161 million).[980] By 2018, Instagram Stories had doubled the number of

Snapchat Stories daily users.[981] When discussing Instagram's decision to clone the Snapchat feature, Instagram VP of Product Kevin Weil remarked: "This is the way the tech industry works."[982]

In another example, Facebook executives approached Houseparty, a social networking app,[983] about a potential acquisition. Houseparty's founders turned down Facebook's offer, and released the product they referred to as "the internet's living room."[984] Shortly thereafter, Facebook announced that its Messenger app would become a "virtual living room."[985] Houseparty's active user base fell by half between 2017 and 2018.[986]

At the Subcommittee's sixth hearing, Representative Henry C. "Hank" Johnson, Jr. (D-GA) asked Mr. Zuckerberg about Facebook's use of data to identify competitive threats. Representative Johnson noted that "over nearly a decade, Mr. Zuckerberg, you led a sustained effort to surveil smaller competitors to benefit Facebook. These were steps taken to abuse data, to harm competitors, and to shield Facebook from competition."[987] He asked Mr. Zuckerberg whether Facebook used Onavo data to purchase WhatsApp. Mr. Zuckerberg responded:

> I think every company engages in research to understand what their customers are enjoying so they can learn and make their products better. And that's what we were trying to do. That is what our analytics team was doing. And I think, in general, that allowed us to make our services better for people to be able to connect in a whole lot of different ways, which is our goal. . . . [Onavo] was one of the signals that we had about WhatsApp's trajectory, but we didn't need it. Without a doubt, it was pretty clear that WhatsApp was a great product.[988]

iii. Facebook Weaponized Access to its Platform

Internal communications by Facebook's senior executives and interviews with former employees at the company indicate that Facebook selectively enforced its platform policies based on whether it perceived other companies as competitive threats.

Facebook developed the Facebook Platform to connect other applications to Facebook's social graph. In an interview in 2007, Mr. Zuckerberg described the goals of the Facebook Platform as making "Facebook into something of an operating system so you can run full applications."[989] A year later, in an email to senior executives at Facebook, Mr. Zuckerberg described Facebook Platform as key to the company's long term success:

> Platform is key to our strategy because we believe that there will be a lot of different social applications and ways that people communicate and share information, and we believe we can't develop all of them ourselves. Therefore, even though it's a challenge for us to get this right, it's important for us to focus on it because the company that defines this social platform will be in the best position to offer the most good ways for people to communicate and succeed in the long term.[990]

Over the next few years, Facebook recognized that access to its social graph provided other applications with a tool for significant growth. In exchange, Facebook hosted content that kept users engaged on its social graph, and considered other ways to monetize this relationship, such as through revenue sharing or advertisements.

By 2012, however, Facebook's senior executives realized that apps could use the Facebook Platform to build products that were competitive with Facebook and "siphon our users."[991] Mike Vernal, Facebook's Vice President of Product and Engineer, described this dynamic to Doug Purdy, Facebook's Director of Product Management:

> When we started Facebook Platform, we were small and wanted to make sure we were an essential part of the fabric of the Internet. We've done that—**we're now the biggest service on earth**. When we were small, apps helped drive our ubiquity. **Now that we are big, (many) apps are looking to siphon off our users to competitive services**. We

> need to be more thoughtful about what integrations we allow and we need to make sure that we have sustainable, long-term value exchanges.[992]

In another conversation between Sam Lessin, Facebook's Director of Product Engagement, and other executives, Facebook's senior employees agreed that competitive apps used Facebook Platform to "steal our engagement" and "could be viewed as replacing Facebook functionality," adding that they planned to raise this concern with Mr. Zuckerberg.[993] Mr. Lessin raised these concerns with Mr. Zuckerberg in October 2012. In response, Mr. Zuckerberg agreed with this conclusion:

> Reading your responses, I do think you are right . . . I would be more comfortable with competition if I thought we knew better how to leverage our scale asset (and if scale weren't becoming cheaper and cheaper to achieve every day). What I think is that we should effectively not be helping our competitors more / much more than how they could get help from elsewhere in the market. They can acquire users in ways other than us so obviously we shouldn't be failing to take their money when they will just give it to someone else and get the same outcome. I do, however, again think that we want as much control here as we can get. I agree we shouldn't help our competitors whenever possible. **I think the right solution here is to just be a lot stricter about enforcing our policies and identifying companies as competitors.**[994]

Recognizing that some social apps had grown too popular and could compete with Facebook's family of products, Facebook cut off their access to Facebook's social graph.[995]

In 2013, Facebook claimed that the short-form video app Vine, a video-sharing app that Twitter acquired in 2012, "replicated Facebook's core News Feed functionality."[996] In response, Facebook cut off Vine's access to Facebook APIs.[997] In doing so, "Facebook was able to degrade consumers'

experience of Vine and reduce the platform's competitive threat."[998] Twitter shut down Vine in 2016.[999]

Facebook's actions in the wake of the Cambridge Analytica scandal raise concerns about pretextual anticompetitive enforcement in the name of privacy. In 2019, Facebook cut off marketing firm Stackla's access to its APIs "due to data scraping, which violates [Facebook's] policies."[1000] Damien Mahoney, the Chief Executive Officer of Stackla, denied these allegations.[1001] In an interview with the Subcommittee, Mr. Mahoney explained the economic harm of the company's foreclosure from the Facebook Platform:

> What we went through with Facebook was company altering, and if not for the resolve of our team and board, would have destroyed it. We had to lay off half our team. We made huge investments in the company in the previous 12 months, having raised $4m to increase our sales capacity by 160% and other functions in the business, then this occurred. It was a critical blow that almost forced us to close the doors. We were approaching 75 employees and 30% growth after 8 long years of toil. Now we have 26 employees, declining revenue and ongoing collateral damage that we continue to sink time and money into. While we try and stabilize, and get the company back to a position of growth, it's a long way off as we continue, to this very day, deal with the after-effects. The fact this all resulted from a single erroneous and factually incorrect news article, combined with zero consultation from Facebook prior to their damaging actions, remains baffling and completely unfair.[1002]

Around that time, Facebook became aware of MessageMe, a fast-growing app that used Facebook graph data to support its "Find Friends" feature. Recognizing that MessageMe could compete with Facebook Messenger, Facebook's then-director of platform partnerships cut off the app's access to Facebook's Graph API.[1003]

In a submission to the Subcommittee, a former Facebook employee who handled platform management at the company said that Facebook unevenly enforced its platform policies based on the

degree of another firm's competition with Facebook and whether it could extract concessions from other firms. According to this former employee, Facebook was primarily concerned with whether a company was "a competitive threat," and it "was biasing its enforcement actions against [firms] they saw as competitors."[1004] In a submission to the Subcommittee, the former Facebook employee provided an example:

> [I]n one Facebook Messages conversation involving the CEO, Mr. Zuckerberg, and various executives in mid-2012, Mr. Zuckerberg expressed concern about an app called Ark that was accessing large amounts of user data in a way that could enable showing user content to people who didn't have permission to see the content. An investigation was conducted, and it was determined that Ark was violating Facebook's platform policies regarding the use of data from friends of Facebook users. Ultimately, leadership decided to terminate Ark's access to Facebook's APIs and ban Ark from the platform for six months. This was a harsh punishment relative to other developers conducting similar activity—indeed, Mr. Zuckerberg had been informed on the thread that "tons" of other apps were acquiring data the same way and there was not further investigation or action taken against those apps. Other apps that had been accused of violating data policies similarly had been treated much more leniently. **It seemed clear that leadership imposed the more severe punishment against Ark because Mr. Zuckerberg viewed Ark as competitive with Facebook, as Facebook was exploring an acquisition of Ark at the same time as it was being investigated for policy violations.**[1005]

In contrast to punishing rivals, according to the former employee and other market participants interviewed by the Subcommittee, Facebook used "whitelists" to give preferential treatment to friends of the company.[1006] For example, in a report published by NBC, Facebook gave Amazon extended API access because Amazon was spending money on advertising and partnering with Facebook on the launch of its Fire smartphone. Facebook's Director of Business Development asked, "Remind me, why did we allow them to do this? Do we receive any cut of purchases?" In response, a Facebook employee who worked with Facebook's "strategic partners" responded, "No, but Amazon is an advertiser and supporting this with advertisement . . . and working with us on deeper integrations for the Fire."[1007]

In response to these concerns, Facebook told the Subcommittee that it "does not restrict access to its Platform APIs simply because an app competes with a Facebook product or service; but

Facebook will restrict apps that violate its policies."[1008] This is, however, inconsistent with the company's internal communications and other evidence examined by the Subcommittee during the investigation.

3. Digital Advertising

a. Overview

Facebook monetizes its platform through the sales of digital advertising.[1009] Facebook garnered over $70 billion in revenue in 2019, a nearly 27% increase from 2018.[1010] It generates this revenue predominately from selling advertisement placements.

Facebook has monopoly power in online advertising in the social networking market.[1011] Notwithstanding Google's dominance, Facebook also has a significant share of revenue and growth in online advertising with many market participants referring to them as duopolies in this broad market. Some market participants interviewed by the Subcommittee consider Facebook "unavoidable" or "must have" due to the reach and scale of its platform. In particular, some businesses consider Facebook's identity product—its ability to persistently track users' online and offline conduct to serve tailored ads—as a unique feature.[1012] For example, at the Subcommittee's fifth hearing, David Heinemeier Hansson, the Chief Technology Officer and Cofounder of Basecamp, testified that the nature of Facebook's targeted advertising makes it difficult to replace, saying:

> At Basecamp, we ultimately ended up swearing off the use of targeted advertisement based on the exploitation of personal data. Facebook's record of protecting people's privacy, and gathering their consent in the exploitation of their data for advertisement purposes, is atrocious, and we decided that we wanted no part of it. But choosing to opt out of targeted advertisement on the internet is like competing with one arm behind your back. It is very clear why most companies feel compelled to do this kind of advertisement, even if it's a violation of their ethics. If their competitors are doing it, they're at a significant disadvantage if they don't. And the same is true for us. We have

> undoubtedly given up growth to competitors because we've refrained from pursuing targeted ads.[1013]

Facebook's advantages in terms of access to data and its reach contribute to its ability to earn higher revenue per user than other firms in the social networking market.[1014] Facebook reported an average revenue per user (ARPU) of $7.05 worldwide and $36.49 in the United States and Canada in July 2020.[1015] It has also averaged significant annual growth—26% on average over the past five years.[1016] In contrast, its closest competitor, Snap, reported in July 2020 that its ARPU "remained flat" at $1.91 worldwide and $3.48 in North America.[1017] A recent investment report underscored this point, noting that Facebook enjoys a significant economic moat illustrated by the inability of Snap and other firms to meaningfully challenge its dominance.[1018] As a result, entry or success by other firms is unlikely:

> With more users and usage time than any other social network, Facebook provides the largest audience and the most valuable data for social network online advertising. Facebook's ad revenue per user is growing, demonstrating the value that advertisers see in working with the firm . . . Facebook has also expanded its user base in the growing mobile market, which positively affected the network effect as it became more valuable to advertisers, and resulted in more ad revenue growth. The main drivers behind growth in online advertising have been growths in the mobile ad market and the video ad format. Most Facebook users are now accessing Facebook and its apps via mobile devices.[1019]

Facebook's internal documents reinforce this finding. In a presentation prepared to deliver to investors ahead of the company's initial public offering, Facebook characterized its advertising product as having a significant advantage over the industry average in accuracy and narrowly targeted campaigns due to its reach, engagement, and using people's "real identity—people as their real

selves."[1020] In comparison to television broadcasters, the company noted that in the United States, "everyday on Facebook is like the season finale of American idol—the most popular show on TV—times two."[1021]

These findings are also consistent with those of Australian,[1022] British,[1023] French,[1024] and German antitrust authorities, which conducted an extensive examination of Facebook's market power in the social networking market and in digital advertising. For example, the United Kingdom's Competition and Markets Authority (CMA) found in July 2020 that Facebook and Instagram generated over half of display advertising revenues in 2019" in the United Kingdom, which it found to be a relevant market.[1025] In contrast to other firms in the same market, Facebook's lead was significantly larger than its closes competitor, YouTube, which "earned between 5 and 10%."[1026] In June 2019, the Australian Competition and Consumer Commission (ACCC) found that Facebook has "substantial market power in the supply of display advertising in Australia."[1027] Similar to the CMA's findings, the ACCC concluded that the share of the display advertising market controlled by Facebook and Instagram is significant—more than half—and growing, while the rest of the market is highly fragmented.[1028]

b. Relevant Acquisitions

On February 27, 2013, Facebook executed an agreement to purchase Atlas, an advertiser-side platform to manage and measure ad performance, from Microsoft for $100 million.[1029]At the time of the transaction, Atlas captured data to track conversions—when a specific action is taken in response to an ad, such as making a purchase—through clicks and impressions.[1030] In other words, if someone saw a BestBuy ad, Atlas enabled serving the ad, recording the user seeing the ad via a browser identifier, and recorded the impression as well as if the person clicked on the ad. Later, if the same user

bought the item from BestBuy.com, Atlas recognized the user through their browser and would record the conversion if the user purchased the item advertised.

Prior to the acquisition, Amin Zoufonoun, Facebook's Vice President for Corporate Development, described the "primary thesis" of the acquisition to Sherly Sandberg as giving Facebook "immediate scale to retarget, provide premium insights, do look-alike modeling, prove and measure efficacy of [Facebook] as a marketing medium, [and] enhance custom audiences and associated revenue."[1031] Facebook's primary strategic rationale for integrating Atlas into its ad product was to improve its ability to measure ad performance and use identity-based targeting through Facebook Identity—its unique identifier for Facebook users across all browsers and devices—to serve highly targeted ads.[1032] Facebook described the value of Facebook Identity as its ability to "target *people* across browsers and devices" and to "activate offline data to enrich online targeting," among other features.[1033] The company believed that its "unique data" and "unique reach and engagement (across devices and platforms)" would boost its value to advertisers.[1034]

Facebook also noted in its summary of the deal at the time of the transaction that the major opportunities of the transaction were: (1) to become the "buy-side desktop tool that media planners fire up first thing in the day;" and (2) to acquire "a deep installed base of pixels which we can immediately turn on to power conversion tracking and attribution of ads across offerings."[1035]

Absent the transaction, Facebook raised concerns that Google's "lead in this market may become insurmountable" and limit Facebook's ads in other ways.[1036] The company also raised concerns that Facebook's Custom Audiences tool would not be able "to scale beyond click-oriented advertisers."[1037] Among other potential risks of the deal, such as rebuilding the product on Facebook's ad stack, the company identified "[m]anaging perceptions around privacy" as an area of concern.[1038]

B. Google

1. Overview

Google was launched in 1998 as a general online search engine.[1039] Founded by Larry Page and Sergey Brin, the corporation got its start by serving users web results in response to online queries. Google's key innovation was its PageRank algorithm, which ranked the relevance of a webpage by assessing how many other webpages linked to it.[1040] In contrast with the technology used by rival search engines, PageRank enabled Google to improve the quality of its search results even as the web rapidly grew. While Google had entered a crowded field, by 2000 it had become the world's largest search engine.[1041] Later that year Google launched AdWords, an online advertising service that let businesses purchase keywords advertising to appear on Google's search results page—an offering that would evolve to became the heart of Google's business model.[1042]

Today Google is ubiquitous across the digital economy, serving as the infrastructure for core products and services online. It has grown and maintained its search engine dominance, such that "Googling" something is now synonymous with online search itself. The company is now also the largest provider of digital advertising, a leading web browser, a dominant mobile operating system, and a major provider of digital mapping, email, cloud computing, and voice assistant services, alongside dozens of other offerings. Nine of Google's products—Android, Chrome, Gmail, Google Search, Google Drive, Google Maps, Google Photos, Google Play Store, and YouTube—have more than a billion users each.[1043] Each of these services provides Google with a trove of user data, reinforcing its dominance across markets and driving greater monetization through online ads.

In several markets, Google established its position through acquisition, buying up successful technologies that other businesses had developed. In a span of 20 years, Google purchased well over 260 companies—a figure that likely understates the full breadth of Google's acquisitions, given that many of the firm's purchases have gone unreported.[1044] Documents collected by the Subcommittee

Google is now one of the world's largest corporations. For 2019, Google reported total revenues of $160.7 billion—up 45% from 2017—and more than $33 billion in net income.[1046] Although Google has diversified its offerings, it generates the vast majority of its money through digital ads, which accounted for over 83% of Google's revenues in 2019.[1047] Search advertising, in particular, is critical to Google, accounting for approximately 61% of its total sales.[1048] In recent months Google reported a drop in ad revenue due to pandemic-related cuts in spending, though the company partly made up for the decline through revenue growth in Google Cloud, Google Play, and YouTube.[1049] Google has enjoyed strong and steady profits, with profit margins greater than 20% for nine out of the last 10 years, close to three times larger than the average for a U.S. firm.[1050] Financial analysts predict that Google is well positioned to maintain its dominance, noting that "Alphabet has established unusually deep competitive moats around its business."[1051]

In 2015 Google underwent a reorganization, introducing Alphabet as a parent company under which Google would reside as a wholly owned subsidiary.[1052] Alphabet also houses the company's non-search ventures, such as Calico, the biotech company focused on longevity, and Waymo, which develops self-driving cars.[1053] In December 2019, Page and Brin stepped down from their management

roles at Alphabet, though they remain on the board and together control approximately 51.3% of the voting power.[1054] Sundar Pichai now serves as the CEO of both Google and Alphabet.[1055]

For years Google has been the subject of antitrust investigations and enforcement actions around the world. From 2011 to 2013, the Federal Trade Commission investigated Google's role in search and advertising markets, culminating in a staff recommendation to file a complaint against Google—although the Commission ultimately decided not to do so. At various points over the last decade, Mississippi, Missouri, and Texas have each separately investigated Google for antitrust violations, and, in September 2019, attorneys general from 50 U.S. states and territories announced that they were opening a fresh antitrust inquiry into the search and advertising giant.[1056] The Department of Justice has also been investigating Google since the summer of 2019, and recent news reports state that a lawsuit may be imminent.[1057] These ongoing U.S. investigations follow multiple antitrust inquiries worldwide, as well as antitrust-related penalties levied on Google by the European Commission, France, India, and Russia.[1058]

2. Search

a. Market Power

Google overwhelmingly dominates the market for general online search. Publicly available data suggest the firm captures over 87% of U.S. search and over 92% of queries worldwide.[1059] Despite

1059 *Search Engine Market Share Worldwide*, STATCOUNTER, https://gs.statcounter.com/search-engine-market-share (last visited Sept. 29, 2020).

notable changes in the market—such as the switch from desktop to mobile—Google has maintained this dominance for more than a decade, a period during which its lead over its most significant competitors has only increased.[1060] Over that time, Google benefited from economies of scale and the self-reinforcing advantages of data, as well as from aggressive business tactics that Google wielded at key moments to thwart competition. The combined result is that Google now enjoys durable monopoly power in the market for general online search.

Several factors render Google's power in online search generally immune to competition or threat of entry. General online search strongly favors scale due to: (1) the high fixed costs of servers needed for crawling and indexing the entire web; and (2) the self-reinforcing advantages of click-and-query data, which let a search engine constantly improve the relevance of search results. Even an upstart that was able to secure the necessary capital to invest heavily in computing infrastructure would find itself at a considerable disadvantage given that Google's search algorithm has been refined through trillions upon trillions of queries.[1061] Meanwhile, steps that website owners take to block non-Google crawlers have rendered the task of creating an independent comprehensive index extremely challenging, if not effectively impossible.

Even search engines that choose to syndicate their search results rather than create their own index and algorithm face major obstacles. This is primarily because Google—through both integration and contractual agreements—has established itself as the default search provider on 87% of desktop browsers and the vast majority of mobile devices. Specifically, Google used its search dominance to promote the use of its Chrome browser on laptops, personal computers, and workstations, which sets Google Search as its default. For mobile devices, Google imposed a set of restrictive contractual terms effectively requiring manufacturers of devices that used its Android operating system to pre-install both Chrome and Google Search. Additionally, Google pays Apple an undisclosed amount, estimated

---

[1060] Enforcers and courts have held that Google dominates the market for online search in various cases stretching back over a decade. *See, e.g.*, Press Release, U.S. Dep't of Justice, Yahoo! Inc. and Google Inc. Abandon Their Advertising Agreement (Nov. 5, 2008), https://www.justice.gov/archive/opa/pr/2008/November/08-at-981.html ("The Department's investigation revealed that Internet search advertising and Internet search syndication are each relevant antitrust markets and that Google is by far the largest provider of such services, with shares of more than 70 percent in both markets."); Press Release, U.S. Dep't of Justice, Statement of the Department of Justice Antitrust Division on Its Decision to Close Its Investigation of the Internet Search and Paid Search Advertising Agreement Between Microsoft Corporation and Yahoo! Inc. (Feb. 18, 2010), https://www.justice.gov/opa/pr/statement-department-justice-antitrust-division-its-decision-close-its-investigation-internet ("The proposed transaction will combine the back-end search and paid search advertising technology of both parties. U.S. market participants express support for the transaction and believe that combining the parties' technology would be likely to increase competition by creating a more viable competitive alternative to Google, the firm that now dominates these markets."); Author's Guild v. Google, No. 05 Civ. 8136 (DC), 2011 WL 986049, *12 (S.D.N.Y. Mar. 22, 2011) (recognizing "Google's market power in the online search market").

[1061] *See* Innovation and Entrepreneurship Hearing at 1 (response to Questions for the Record of Adam Cohen, Dir. of Econ. Pol'y, Google LLC) ("Google Search responds to trillions of user queries from around the world every year."); *see also* MAURICE E. STUCKE & ALLEN P. GRUNES, BIG DATA AND COMPETITION POLICY 12.10 (2016) ("Entry barriers into the search engine market are already high. Microsoft reportedly invested in 2010 'more than $4.5 billion into developing its algorithm and building the physical capacity necessary to operate Bing.").

to be $12 billion per year, to secure the search default across iOS devices.[1062] In general, users tend to stick with the default presented.[1063] Moreover, Google takes steps to hamper and dissuade even those users that do attempt to switch search engines on Chrome.[1064] With these factors combined, Google's conduct significantly impedes other search providers from reaching users at scale—and further expands and entrenches Google's dominance.

In submissions to the Committee, Google states that Google Search "operates in a highly competitive environment," facing a "vast array of competitors" in general online search, including Bing, DuckDuckGo, and Yahoo!.[1065] Google also claims that for any given search query, Google competes against a "wide range of companies," including Amazon, eBay, Kayak, and Yelp.[1066] Google argues that this broader set of competitors means that public estimates of its share of general online search "do not capture the full extent of Google's competition in search."[1067]

Despite these statements, Google failed to provide the Subcommittee with contemporary market share data that would corroborate its claims. In response to the Committee's written request for market share data, combined with several follow-ups from Subcommittee staff, Google stated that the company "doesn't maintain information in the normal course of business about market share in its products."[1068] After the Subcommittee identified communications where Google executives had discussed regularly tracking search market share data and further developing internal tools for doing so, Google told the Subcommittee that this data is either no longer collected or no longer used for examining site traffic.[1069] It added, "[W]hile Google may have examined certain 'shares' of usage,

1066 *Id.*; *see also* Innovation and Entrepreneurship Hearing at 6 (statement of Adam Cohen, Dir. of Econ. Pol'y, Google LLC). Although the specialized search providers that Google lists as competitors may, in some instances, compete with Google for queries, "[t]he competition between Google and vertical search engines" is "to some extent asymmetrical. From a user's point of view, a generalist search engine that fully covers a given vertical can be a complete substitute for the vertical search engine, while the reverse is not generally true. Consequently, Google imposes more significant competitive constraints on a vertical search engine than vice versa." *See* Submission from Source 209, to H. Comm. on the Judiciary, Source 209-0000540 (Feb. 17, 2011) (on file with Comm.).

1067 Production of Google, to H. Comm. on the Judiciary, A-11 (Nov. 22, 2019) (on file with Comm.). In certain regards, Google's argument echoes the claim Microsoft made when it contested the district court's decision to exclude "middleware" from its definition of the relevant market. The court found that although it was true that middleware could "usurp the operating system's platform function and might eventually take over other operating system functions," it was also true that no middleware product "could now, or would soon, expose enough APIs to serve as a platform for popular applications, much less take over all operating system functions." United States v. Microsoft Corp., 253 F.3d 34, 53–54 (D.C.C. 2001). Similarly, although certain vertical search providers could under certain circumstances "usurp" the horizontal provider's platform function, no vertical provider does or would soon serve this function.

1068 Meeting with Google (Feb. 10, 2020).

1069 Production of Google, to H. Comm. on the Judiciary, GOOG-HJC-01967913 (Jan. 27, 2007) (on file with Comm.) ("Each quarter we gather comprehensive search and market share data even though we NOT share it with the board clicks, queries, or traffic in limited and incomplete data sets over time, we do not believe any of this constitutes 'market share' analysis."[1070]

Market share information that Google did provide from over a decade ago reveals that Google viewed itself as a leader in general search as early as 2007. One slide deck tracking search query volume and revenues stated that "[c]ontinued leadership in search underpins the whole business."[1071] In 2009, a top executive circulated market share analysis documenting that Google captured 71.5% of general search in the United States, followed by Yahoo with 17%, and Bing with 7.5%.[1072] And in 2010, one Google employee observed, "Google leads competitors. This is our bread-and-butter. Our long-tail precision is why users continue to come to Google. Users may try the bells and whistles of Bing and other competitors, but Google still produces the best results."[1073] Noting that Bing was "making clear, significant progress" on "bringing the two search engines closer to parity," the employee stated it was "critical to redouble our efforts to maintain our lead."[1074]

The Subcommittee has not seen any compelling evidence to suggest that Google's dominance over the last decade has diminished; to the contrary, there is compelling evidence that Google has only strengthened and solidified what was already a leading market position. For example, in 2009, Microsoft and Yahoo!—Google's closest competitors—entered an agreement to integrate their search platforms, an effort to team up to tackle Google's dominance.[1075] A decade later, the two collectively have a lower share of the general search market than they did at the time of their deal, whereas Google's share has increased.[1076] As of 2016, Google employees were calculating that Bing had suffered a 30% year-over-year decline in query volume and that Bing's revenue per million impressions (RPM) was "70-77% lower" than Google's own U.S. search RPM.[1077] More recently, the United Kingdom's Competition and Markets Authority found that Google's index of the web is anywhere from three to five times the size of Bing's.[1078] Furthermore, the fact that no new general

search entrant over the last decade has ever accounted for more than 1% of all U.S. searches in any given year further confirms that Google's monopoly power is durable and its lead insurmountable.[1079]

Google's claim that it "operates in a highly competitive environment" is also at odds with the lived reality of market participants. Numerous companies—spanning major public corporations, small businesses, and upstart entrepreneurs—told the Subcommittee that they overwhelmingly depend on Google for traffic and that no alternate search engine even remotely approaches serving as a substitute. For example, J&J Smith, a printer repair shop based in Rhode Island, stated, "Google is our lifeblood."[1080] Foundem, a UK-based comparison shopping search provider, has noted that Google's "overwhelming global dominance" of horizontal search creates for most websites an "uncomfortable but unavoidable reliance on Google."[1081] Many other companies described their dependence on Google in similar terms.

Furthermore, some of the same specialized search providers that Google identifies as competitors stated that their own businesses heavily rely on Google, in some cases for up to 80% of traffic on both desktop and mobile devices.[1082] One specialized search provider wrote that Google's business practices "have a very material effect on [our] business, but due to Google's monopoly power in search, there is nowhere else for [us] to turn for additional search traffic. The company is beholden to how Google decides to structure its search results page and algorithm."[1083] Another told the Subcommittee, "From [our] perspective, there are no adequate substitutes for Google,"[1084] and, "[T]hanks to its monopoly in general internet search, Google has become the gatekeeper for vertical search rivals."[1085] One specialized search provider said that 97.6% of its traffic comes from Google; another said that Google accounted for such an outsized share of traffic that "we don't even track non-Google sources."[1086]

At the Subcommittee's field hearing in January 2020, David Heinemeier Hansson, Cofounder and Chief Technology Officer of Basecamp, testified that Google increasingly functions as "the front door of the internet."[1087] He noted, "[Google is] the start page for millions. It's a form of navigation around the internet. People these days rarely bother to remember the specific internet address of a

company they want to do business with, they just google it."[1088] Commenting on the stark asymmetry in the general search market, Hansson stated that Yahoo, Bing, and DuckDuckGo all "could drop [Basecamp] from their listings tomorrow and we'd barely notice," but "[w]e lose our listing in Google and we may go out of business."[1089]

Google obtained default placement across the mobile and desktop ecosystem through both integration and contractual arrangements. Through owning Android, the world's dominant mobile operating system, Google was able to ensure that Google Search remained dominant even as mobile replaced desktop as the critical entry point to the Internet. As discussed elsewhere in the Report, documents submitted to the Subcommittee show that, at certain key moments, Google conditioned access to the Google Play Store on exclusively pre-installing Google Search, a requirement that gave Google a significant advantage over competing search engines. Through revenue-sharing agreements amounting to billions of dollars in annual payments, Google also established default positions on Apple's Safari browser (on both desktop and mobile) and on Mozilla's Firefox.[1090]

In public statements, Google has downplayed the significance of default placement, claiming that "competition is just a click away."[1091] However, Google's internal documents show that, at a time when Google was still jostling for search market share, Google executives closely tracked search defaults on Microsoft's Internet Explorer and expressed concern that non-Google defaults could impede Google Search.[1092] In an internal presentation about Internet Explorer's default search selection, Google recommended that users be given an initial opportunity to select a search engine and that browsers minimize the steps required to change the default search provider.[1093] These discussions, as well as the steep sums Google pays Apple and various browsers for default search placement, further highlight the competitive significance of default positions.

Independent search engines told the Subcommittee that the lack of defaults available to them creates significant business challenges. DuckDuckGo said this lack of options compelled it to invest in browser technology, including the creation of its own browser for Android and iOS and various browser extensions.[1094] It noted, however, that "the same default placement challenges exist in the browser

market, just one level up – with the device makers requiring millions or billions of dollars to become a default browser on a device."[1095]

Lastly, the Subcommittee's findings are consistent with conclusions reached by several enforcement bodies that recently have investigated Google's market dominance. For example, in July 2020 the United Kingdom's Competition and Markets Authority found that "Google has significant market power in the general search sector," a position maintained through "three key barriers to entry: economies of scale in developing a web index; access to click-and-query data at scale; and Google's extensive default positions."[1096] In July 2019, the Australian Competition and Consumer Commission (ACCC) found that Google has "substantial market power in supplying general search services," and that it is "likely to retain its dominant share of the market at least in the short- to medium-term."[1097] And in two separate enforcement actions in 2017 and 2018, the European Commission found that Google possessed market power in the market for online general search.[1098] While each of these enforcers focused on their respective national and regional markets, Google has failed to identify any factors that would compel the Subcommittee to reach a different conclusion for the U.S. market.

b. Conduct

i. Google Leverages Dominance Through Data Misappropriation and Self-Preferencing

When Google launched in 1998, the search listings it delivered were "ten blue links," or a set of organic results that guided users off Google's webpage to locate relevant information. In the years since, Google, as well as Bing, has evolved to displaying blue links alongside a variety of Google's own content as well as "information boxes" that list responses directly on the search results page.

While this model may, in certain instances, provide users with direct information more quickly, documents collected by the Subcommittee show that Google built some of these features through aggressive tactics that exploited its search dominance. Google's conduct helped maintain its monopoly in online search and search advertising while dissuading investment in nascent competitors, undermining innovation, and harming users and businesses alike.

(3) each national market for general search services in the EEA.").

According to internal documents, Google executives recognized as early as 2005 that specialized—or "vertical"—search engines could pose a threat to Google's long-term dominance. That year one program manager wrote:

> [W]hat is the real threat if we don't execute on verticals?
> (a) loss of traffic from google.com because folks search elsewhere for some queries
> (b) related revenue loss for high spend verticals like travel
> (c) missing [opportunity] if someone else creates the platform to build verticals
> (d) if one of our big competitors builds a constellation of high quality verticals, we are hurt badly[1099]

Google's apprehension about vertical search providers persisted. For example, a 2006 strategy memo identifying challenges asked, "How do we deal with the problem of 'proliferating verticals?'"[1100] Another message noted, "Vertical search is of tremendous strategic importance to Google. Otherwise, the risk is that Google is the go-to place for finding information only in the cases where there is sufficiently low monetization potential that no niche vertical search competitor has filled the space with a better alternative."[1101] In short, Google executives feared that vertical search providers would build direct relationships with users, thereby bypassing Google Search and diverting traffic, valuable data, and ad revenue. While vertical search providers were complements to Google in the short term, Google recognized their potential for disintermediating Google and therefore viewed them as a major competitive threat. The fact that several of these verticals specialized in commercial queries that were among the most valuable for Google further raised the stakes.[1102]

Documents show that Google developed a multi-pronged strategy to thwart the threat. Two of these tactics included: (1) misappropriating third-party content; and (2) privileging Google's own services while demoting those of third parties. Through these practices, Google exploited its dominance to weaken potential rivals and boost its search advertising revenue.

1) <u>Misappropriating Third-Party Content</u>

In the years following 2005, Google invested in building out its own vertical services. Documents reveal that Google partly did so through lifting content directly from third-party providers to bootstrap Google's own vertical services. In the process, Google leveraged its search dominance—demanding that third parties permit Google to take their content, or else be removed from Google's search results entirely.

[1099] Production of Google, to H. Comm. on the Judiciary, GOOG-HJC-04137557 (Nov. 29, 2005) (on file with Comm.).

[1100] *Id.* at GOOG-HJC-01099230 (Oct. 20, 2006).

[1102] *Id.* at GOOG-HJC-04276684–87 (Sept. 21, 2012).

For example, after identifying local search as a "particularly important" vertical to develop, Google built Google Local, which licensed content from local providers, including Yelp.[1103] In 2010 Google rolled out a service directly competing with Yelp, even as Google continued to license Yelp's content—prompting Yelp's CEO to request that Google immediately remove Yelp's proprietary content from Google's own service.[1104] At a time when Google Local was failing to gain momentum, Google told Yelp that the only way to have its content removed from Google's competing product was to be removed from Google's general results entirely.[1105] Yelp relied so heavily on Google for user traffic that the company could not afford to be delisted—a fact that Google likely knew.[1106] In short, Google weaponized its search dominance, demanding that Yelp surrender valuable content to Google's competing product or else risk heavy losses in traffic and revenue.

Evidence gathered by the Subcommittee identifies additional instances in which Google has intercepted traffic from third-party websites by forcibly scraping their content and placing it directly on Google's own site. For example, a submission from entrepreneur Brian Warner described how he built a database from scratch and developed it into a sustainable and growing business—only to watch Google lift his content and sink his traffic.[1107] Warner, the founder of Celebrity Net Worth, told the Subcommittee that in 2012 the content he had initially developed as a side-project had such high demand that Warner was able to quit his day job and hire 12 staff members. In 2014 Google contacted Warner to ask if he would provide Google with an API that would display his webpage's content in an "answer box" that would appear directly on Google's search results page. Warner declined, observing that handing over his company's "most valuable asset" would "cause a catastrophic drop in traffic."[1108]

[1103] *Id.* at GOOG-HJC-03665122–26 (Apr. 24, 2007) (internal Google discussion noting the strength of Yelp's local product) ("[T]here is nothing else 'yelp like' in our current lineup," and also noting that "[Yelp's CEO] just contacted the account manager here and asked that their contract be revised so that they could cancel it immediately if we launch reviews, that doesn't mean that they would do it, but clearly this is a big deal to them.").

[1104] *Id.* at GOOG-HJC-03249494 (Aug. 10, 2010) ("Given that this App directly competes with the Yelp App and offers little value to Yelp we cannot allow Google to continue leveraging our content in this way. We've communicated to Patrick and Carter that your team needs to remove our content within the next week. Since you already communicated to me that it would be un-Googley to not remove our content when requested, I'm confident your team will do the right thing.").

[1105] *See, e.g.*, *id.* at GOOG-HJC-03255279 (Oct. 28, 2010) ("[I] want to tell you that my feelings are really hurt by the 'local is a failure' stuff that Nikesh has been lobbing around"); GOOG-HJC-03790807–08 (Apr. 24, 2007) ("[W]e are still waiting to be removed from Places (while remaining in organic and local merge results), which you initially agreed to (but more recently pulled away from)."); GOOG-HJC-01234494–96 (Aug. 10, 2011) ("I was surprised to find that by opting out of Google's local product, Yelp was automatically opted out of portions of Google's search results. Carter Maslan and John Hanke last year said they couldn't/wouldn't remove Yelp content from Google's local product because local was powered by the same index as web search, sounds like this was never really the case."); *see* GOOG-HJC-01234494–96 ("To be able to reference Yelp's content in the parts of search results we discussed, our local service needs to be at least aware of the existence of Yelp pages. Since we stopped using any crawled Yelp pages for our local services in response to your request, this currently isn't possible. That said, I think that the approach we discussed, with Google making limited use of Yelp data in the ways you described, is a constructive way to get a comprehensive view for our users.").

[1106] *See, e.g.*, *id.* at GOOG-HJC-03664462 (Apr. 23, 2007) ("78% of their uniques come from google. if they are acquired, i [sic] would assume that they wouldn't turn us off.").

[1107] *See generally* Innovation and Entrepreneurship Hearing (statement of Brian Warner, Founder, Celeb. Net Worth).

[1108] *Id*. at 4.

Within two years, Google began populating its answer boxes with Celebrity Net Worth's content anyway—displaying net worth results for each of the 25,000+ celebrities from Warner's database directly on Google's search results page.[1109]

Combined with changes that pushed Warner's webpage from the top of organic listings to the middle of the second page, Google's scraping caused traffic to Celebrity Net Worth to drop by 50% overnight.[1110] Warner wrote, "With the flip of a switch, Google turned our original content into its own content. And with that move, Google would keep the searcher within its walled garden indefinitely. That is far more valuable to Google than taking a small cut of our AdSense revenue."[1111] Today Celebrity Net Worth's traffic is down 80% from 2014, and—due to the resulting drop in revenue—Warner has had to lay off half of his staff.[1112]

In a submission to the Subcommittee, lyrics site Genius described similar misappropriation by Google. Genius noted that it has invested "a decade and millions of dollars" developing a lyrics repository that relies on user-generated content as well as partnerships with songwriters.[1113] For years, however, Google has copied lyrics from Genius's website and displayed them in information boxes that it places at the top of its search results page.[1114] Although Genius shared with Google evidence showing that the platform was scraping lyrics directly from Genius, Google for two years "did nothing to address the issue."[1115] It was only after the *Wall Street Journal* published Genius's claims that Google responded, taking steps to remove the evidence that Google had copied the lyrics but leaving the lyrics in place.[1116] Google later announced that it would attribute lyrics placed in the information box to the underlying content provider. "This would be encouraging," Genius wrote, "except for the fact that all of the lyrics we flagged for Google as featuring our watermark—and thus clearly copied from Genius—are currently attributed to another company."[1117]

At the Subcommittee's hearing on July 29, 2020, multiple members questioned Mr. Pichai about Google's misappropriation of third-party content. Subcommittee Chairman David N. Cicilline (D-RI) recounted Google's scraping of Celebrity Net Worth, asking, "[W]hy does Google steal content

---

[1109] *Id*. Because Warner had added several conjured celebrities to his site to gauge whether Google was scraping his content or lifting it from elsewhere, he was able to determine that Google was sourcing its answers directly from Celebrity Net Worth.

[1117] *Id*.

from honest businesses?"[1118] Mr. Pichai responded that he "disagree[d] with that categorization." Representative Ken Buck (R-CO) followed up by noting that Genius seemed to have collected clear evidence of Google's misappropriation:

> When Genius suspected this corporate theft was occurring, the company incorporated a digital watermark in its lyrics that spelled out red-handed in Morse code. Google's lyric boxes contained the watermark showing that your company stole what you couldn't or didn't want to produce yourself. After Google executives stated that they were investigating this problematic behavior, Genius created another experiment to determine the scope of the misappropriation. It turns out that, out of 271 songs where the watermark was applied, 43 percent showed clear evidence of matching. Your company, which advertises itself as a doorway to freedom, took advantage of this small company, all but extinguishing Genius' freedom to compete."[1119]

Mr. Pichai responded that Google "license[s] content from other companies," and that this issue was "a dispute between Genius and other companies in terms of where the source of the content is."[1120] In its response to Questions for the Record from the Subcommittee, Google also stated that it now gives webpage owners the ability to exclude certain content from appearing in information boxes on Google's search results page.[1121] However, multiple webpage publishers stated that, in practice, this option fails to mitigate the harm given that Google will continue to source and display content from others, thereby still intercepting traffic and displacing organic listings. One publisher described Google's claim to give webpage owners more control as "an empty offering."[1122]

In an interview with Subcommittee staff, one webpage owner stated that he felt deceived by Google's decision to use its crawling advantages to misappropriate third-party content. The webpage owner said:

> A major violation occurred when Google used robotic information scraped by its crawler to create content of its own which is displayed in the search result page. We never would have created sitemaps for Google if those were the terms. Google wouldn't have had sitemaps from every website on earth feeding it content if those were the terms from the beginning. They would have been forced to create a new system in order

to convince sites to comply or a new search service would have been born that had different options.[1123]

Google's practice of misappropriating third-party content to bootstrap its own rival search services and to keep users on Google's own webpage is further evidence of its monopoly power and an example of how Google has abused that power. Google seized value from third-party businesses without their consent. These businesses had no effective choice but to allow Google's misappropriation to continue, given Google's search dominance. In this way, Google leveraged its search dominance to misappropriate third-party content, free-riding on others' investments and innovations.

2) <u>Self-Preferencing</u>

Evidence shows that once Google built out its vertical offerings, it introduced various changes that had the effect of privileging Google's own inferior services while demoting competitors' offerings. This conduct has undermined the vertical search providers that Google viewed as a threat. It has also boosted Google's ad revenue by keeping users on Google's domains for longer and by compelling demoted firms to pay Google more ad fees to reach users.

In 2007 Google introduced "Universal Search," which presented users with search results that integrated Google's various specialized search services, including Google Images, Google Local, and Google News.[1124] Universal Search was designed to improve users' search experience, as well as to increase traffic to Google's own offerings—even when those offerings weren't the best or most relevant for users.[1125] Google's documents suggest that shortly after launching Universal Search, traffic to Google's own vertical services increased.[1126] Even early in its conception, Google executives were exploring how Universal Search could be used to show a "results page promo" to "bootstrap traffic" to Google's other products.[1127]

[1127] *Id.* at GOOG-HJC-01230599 (Dec. 8, 2004) (on file with Comm.) ("Including some of Urs ideas around promoting the Labs property on the Google.com results pages for some subset of users ("New! Try your search on the next version of Google"). Urs main concern was that Lab gets limited traffic, and the set of users is not representative of Google's user base. He didn't mind the idea of a Labs launch in principle, but he suggested we show a results page promo for some small percentage of users to bootstrap traffic to the property with a more diverse set of users.").

When Google launched Universal Search, it gave prominent placement to Google's vertical content over superior, more relevant competitors' products. Google's documents show that Google adjusted its search algorithm to automatically elevate the ranking of some of Google's services above those offered by rivals.[1128] These perks are generally not available to competing verticals, placing them at an instant disadvantage.[1129] Given that the likelihood that a user will click on a listing sharply declines with each drop in placement, traffic to rivals demoted by Google has fallen significantly.[1130] The effect is magnified on mobile search, where the small screen means fewer results are displayed on the first page of results.[1131]

In a submission to the Subcommittee, one vertical search provider described the practical effects of Google's discriminatory treatment:

> When the Local OneBox appears on the page, links to [the company's] website with highly relevant [results] get pushed down the page into the lower section for organic search results. This demotion puts [the company] at a competitive disadvantage relative to Google's local search results and jeopardizes the health of [our] business—and this problem is further exacerbated in the growing mobile context where links to [our] website may be pushed off the small screen or the first page of search results altogether. In evaluating options to reduce this harm, [the company] has reached out to Google to explore whether [we] or [our] providers' listings on [our] website could be included in Google's local search results, but Google has either refused outright or taken no steps to allow such inclusion.[1132]

A submission from another vertical search provider stated that once Google began automatically placing its own competing service at the top of its search results page, the vertical provider's organic search traffic fell by approximately 20%.[1133] The vertical provider observed that Google's service is worse for users—showing higher prices and fewer choices than Google's

competitors.[1134] However, Google continues to give its service top placement, occupying close to 100% of the above-the-fold mobile search results page and around 25% of desktop.[1135]

Additional market participants echoed the view that Google's self-preferencing comes at the expense of users. One search provider stated that Google prohibits it from displaying live prices on Google's results page, even as Google's own competing service is permitted to do so. Stating that there was no pro-competitive justification for this differential treatment, the firm also noted that Google's limits on rival vertical search providers likely prevent consumers from seeing the cheapest or best-valued prices.[1136]

In addition to placing its vertical offerings at the top of the search results page, Google has also actively demoted certain rivals through imposing algorithmic penalties. For example, in 2007 and in 2011, Google launched an algorithm that demoted sites that Google considered "low quality."[1137] Among the websites especially hit were comparison shopping providers, which enable users to compare product offers from multiple merchant websites.[1138] In a submission to the Subcommittee, one publisher stated that Google's algorithmic penalty caused search leads and revenues to its website to fall by 85%.[1139] Kelkoo, previously a leading comparison shopping site, explained that Google's demotion set off a "cyclic trend" whereby a reduction in traffic leads to fewer consumers, which leads to fewer listings and less revenue, which leads to reduced investment—which, in turn, contributes to a further decline in traffic, a "network effect in reverse."[1140]

In external messaging, Google justified the algorithmic penalties it imposed on third-party sites as a response to users' desire to see less "low quality" sites in their search results.[1141] However, Google did not subject its own vertical sites to the same algorithmic demotion, even though Google's vertical services aggregated and copied content from around the web—just like the third-party sites that Google had demoted.[1142] Indeed, Google's documents reveal that employees knew Google's own

[1142] *Id.* at GOOG-HJC-02507422 (Apr. 4, 2006) (on file with Comm.) ("Keep in mind that, as we discussed, most of the information that is on pages that we create is aggregated from various sources, and those sources often have that material vertical sites would likely fit the demotion criteria that Google applied to other sites. When one employee suggested that Google index its comparison shopping site, Froogle, another responded that it was unlikely Froogle would get crawled "without special treatment," noting, "We'd probably have to provide a lot of special treatment to this content in order to have it be crawled, indexed, and rank well."[1143]

Despite the fact that Google's own comparison shopping service was of such low quality that Google's product team couldn't even get it indexed, Google continued to give Froogle top placement on its search results page, listing its results in the OneBox, a display box that Google populates with information on its search results page.[1144] Bill Brougher, a product manager, acknowledged that Google was privileging low-quality content, writing:

> Our algorithms specifically look for pages like [Froogle's] to either demote or remove from our index, and there are active projects to improve the integration into web search. The bigger problem these projects have is to improve their own result quality. For instance with Froogle, the onebox trigger is now very good and relevant, but the three results we show from Froogle in that onebox generally rate very low in our search quality evaluation. It is often the same with Local.[1145]

Another Google team member replied: "Yes, you're right that the Onebox result items often stink."[1146] A few years later, a Google employee again acknowledged that if Google ranked its own content according to the same criteria that it applied to competitors, "it will never rank."[1147]

In an interview with Subcommittee staff, one vertical site stated that Google had not only demoted the firm but had at least one instance removed it from Google's index entirely.[1148] The search provider stated that after Google purchased its rival, Google demoted the provider in search rankings while vaulting those of its rival.[1149] The search provider observed that Google's demotions sometimes followed favorable press that highlighted the search provider's popularity with users. "There was an

---

online already. Because of this, the search quality team has some concerns as to if/when this Google-created content will be indexed. And once it is indexed, it is unlikely to appear high in the search results.").

article that came out in the press that painted [us] in a positive light and quoted an executive noting that [we are] the top result when a user searches [for a particular search term]. The next day, Google de-indexed [us] for [that search term]."[1150]

In July, the *Wall Street Journal* reported that Google also gives preferential treatment to YouTube.[1151] Tests conducted by the *Journal* found that searching Google for videos delivered YouTube in results much more prominently than competing video providers, even when competitor videos had more engagement. Reflecting interviews with those familiar with the matter, the piece stated that Google engineers:

> [M]ade changes that effectively preference YouTube over other video sources. Google executives in recent years made decisions to prioritize YouTube on the first page of search results, in part to drive traffic to YouTube rather than to competitors, and also to give YouTube more leverage in business deals with content providers seeking traffic for their videos." [1152]

In response to Questions for the Record from Subcommittee Chairman David N. Cicilline (D-RI), the company denied that Google Search is designed to favor YouTube. Although Google stated that it disagreed with the methodology used by the *Journal*, Google did not provide the Subcommittee with any data or internal reports that would support its claim.[1153]

Numerous market participants noted that Google's favoring of its own sites and demoting those of third parties has effectively increased their cost of distribution. Since demoted sites can generally only recover traffic through advertising on Google, the platform "essentially requires competitors to pay for their websites to appear above Google's own links," according to one market participant.[1154] Another business recalled that in 2016 Google demoted one of its vertical offerings, citing a policy of diversifying content.[1155] The firm stated that once it was penalized in organic rankings, it "could not get an appropriate customer service response for months" and ultimately "had to increase [marketing spend on Google] to regain lost traffic—a win-win for Google but a loss for [our business] and its users."[1156]

[1156] *Id.*

Meanwhile, Google's own competing vertical "is always listed at the top" of search results.[1157] The incident highlights how demoting rivals can enrich Google in two ways: first, through diverting greater traffic and business to its own products; and second, through earning ad revenues from the penalized sites that are subsequently scrambling to recover their search placement. When demoting firms that Google views as actual or potential competitive threats, Google is effectively raising rivals' costs.

Another firm noted that demoted vertical providers that go on to buy ads on Google not only feed revenue to a potential or actual competitor in specialized search, but also risk handing Google more commercially sensitive information. The market participant wrote:

> Google thus deceptively siphons internet traffic away from its vertical competitors in online travel and forces them to pay more for [search engine monetization] and [] Ads in order to get meaningful placement on Google's [search engine results page]. Importantly, Google also requires its vertical competitors to provide their inventory feed to populate the ads, allowing Google to appropriate vertical service providers' valuable inventory data.[1158]

A significant number of the website publishers that the Subcommittee interviewed noted the outsized effect that a single algorithmic change by Google can have on their business. Brian Warner, Celebrity Net Worth founder, stated, "All website owners live in constant fear of Google's algorithm updates. Without explanation or recourse, Google can deliver a fatal blow to a website's search ranking visibility."[1159] Foundem, the UK-based comparison shopping site, wrote, "An unjustified Google search penalty, whether imposed anticompetitively or in error, has the power to cause grave and irreparable harm to virtually any online business."[1160]

3) Threatening Innovation and the Open Internet

Through misappropriating third-party content and giving preferential treatment to its own vertical sites, Google abused its gatekeeper power over online search to coerce vertical websites to surrender valuable data and to leverage its search dominance into adjacent markets. Google's conduct both thwarted competition and diminished the incentive of vertical providers to invest in new and innovative offerings.

[1157] *Id.*

[1158] Submission from Source 115, to H. Comm. on the Judiciary, 16 (Oct. 22, 2019) (on file with Comm.).

[1159] Submission from Celebrity Net Worth, to H. Comm. on the Judiciary, 10 (Oct. 14, 2019) (on file with Comm.).

[1160] Submission from Foundem, to H. Comm. on the Judiciary, 42 (Oct. 22, 2019) (on file with Comm.). Foundem was the lead complainant in the European Commission's antitrust investigation and case on Google Shopping.

In an interview with the Subcommittee, one market participant observed that Google's conduct has sapped investment, as "investors don't want to invest in companies that are producing content that relies on Google traffic," resulting in "less capital invested in companies reliant on traffic from Google."[1161] The website noted that Google's business practices have also skewed the website's own investment decisions, leading it to allocate the vast majority of its revenue to creating "news-like temporary content" rather than "evergreen content."[1162] It added, "If we could trust that Google was not engaging in unfair search practices, we would be producing different content."[1163]

A vertical provider, meanwhile, said that Google's conduct had held the firm's growth "at bay" and risks reducing innovation over the long term, as providers whose growth is capped by Google may be more reluctant to invest and expand.[1164] It added:

> Competitors are not the only ones who have a reduced incentive to innovate as a result of Google's conduct. The anticompetitive effects reduce Google's own incentives to improve the quality of its services, because it does not need to compete on the merits with rival services.[1165]

To illustrate this point, Yelp offers a contrast between its own efforts to maintain high-quality user reviews and Google's efforts. It states that of the approximately 150 million user reviews submitted to Yelp since 2005, Yelp has displayed only 72% of them to users, while flagging 21% as "not recommended."[1166] Yelp cites investment research noting that Google, by contrast, does not invest in curating its reviews: "25% of Google's reviews have zero characters and are simply Netflix-style one-click star ratings from which the user can derive few, if any, insights about the trustworthiness of the submission."[1167]

Several market participants told the Subcommittee that Google's business practices in online search have already foreclosed opportunity. In a submission, Celebrity Net Worth founder Brian Warner wrote:

> It is my view that Google has removed essentially all of the oxygen from the open internet ecosystem. There is no longer any incentive or even basic opportunity to innovate as I did back in 2008. If someone came to me with an idea for a website or a

web service today, I would tell them to run. Run as far away from the web as possible. Launch a lawn care business or a dog grooming business—something Google can't take away as soon as he or she is thriving.[1168]

More broadly, market participants expressed concern that Google has evolved from a "turnstile" to the rest of the web to a "walled garden" that increasingly keeps users within its sites.[1169] Many observers have noted that when Google filed its initial public offering, Google co-founder Larry Page identified the company's mission as the following: "We want you to come to Google and quickly find what you want…We want you to get you out of Google and to the right place as fast as possible."[1170] In recent years, however, studies have shown that more than half of all queries on Google either terminate on Google or result in a click to Google's own properties—a share that is growing over time.[1171] In July, *The Markup* published results showing that Google allocated 41% of the first search results page on mobile devices to Google's own content."[1172]

On several occasions over the course of the investigation, Subcommittee Chairman David N. Cicilline (D-RI) asked Google about this trend.[1173] At the Subcommittee's July 16, 2019 hearing, Google's Director of Economic Policy, Adam Cohen, stated that Google's goal is "to provide users information as quickly and efficiently as possible," adding that he was "not familiar" with studies showing that a majority of queries now terminate on Google.[1174] In its July 26, 2019 response to a follow-up letter from Chairman Cicilline, Google wrote that it strives to "give users the most relevant, highest quality information as quickly as possible," a goal that Google claims is "[c]onsistent with Mr. Page's comments in 2004."[1175] When asked whether it was true that less than 50% of all searches on Google resulted in clicks to non-Google websites, Google responded that it "has long sent large

amounts of traffic to other sites."[1176] In response to the Subcommittee's request for query metrics that would document the underlying trends, however, Google did not produce the relevant data.[1177]

Several enforcement bodies have examined these business practices. Between 2011 and 2013, the Federal Trade Commission pursued an inquiry into Google's data misappropriation and self-preferencing, among other conduct. Staff at the Bureau of Competition concluded that "the natural and probable effect" of Google's misappropriation was "to diminish the incentives of vertical websites to invest in, and to develop, new and innovative content."[1178] On Google's self-preferencing, staff concluded that Google's conduct had "resulted in anticompetitive effects,"[1179] but that Google had offered "strong procompetitive justifications."[1180] In 2017, the European Commission concluded that Google's self-preferencing in comparison shopping services constituted an illegal abuse of dominance and ordered Google to implement a remedy of "equal treatment."[1181] The European Commission stated that Google had not "provided verifiable evidence to prove that its conduct is indispensable" to any procompetitive effects.[1182]

ii. Google Increased Prices for Market Access and Degraded Search Quality

In 2000, Google launched AdWords, which allowed advertisers to pay for keyword-based ads that would appear to the right of Google's search results.[1183] In the years since, Google has changed the display of the ads on its search engine results page in several ways, most notably by (1) increasing the number of ads placed above organic search results, and (2) blurring the distinction between how ads and organic listings are presented on Google's search results page. These changes have effectively raised the price that businesses must pay to access users through Google. Market participants told the Subcommittee that Google's conduct has undermined competition, misled consumers, and degraded the overall quality of Google's search results—all while enabling Google to further exploit its monopoly over general online search.

[1176] *Id.* at 2.

[1177] In a September 2020 response to Chairman Cicilline on this same question, Google disputed Fishkin's analysis of the data. Google wrote "The fact that a user does not click on a link on a Google Search results page does not mean that the user has been "kept" on Google properties. Searches on Google may result in zero website clicks for many reasons, which is not discernable without directly asking the user why they did not click a link." [1183] Press Release, Google, Google Launches Self-Service Advertising Program (Oct. 23, 2000), http://googlepress.blogspot.com/2000/10/google-launches-self-service.html.

Google's clear dominance in online search also gives it significant control over the search advertising market. Publicly available data suggests Google captured around 73% of the search advertising market in 2019.[1184] Submissions from market participants show that many firms spend the vast majority of their ad budgets on Google. For example, one major vertical provider spent significantly more than half of its total ad spend on Google each year from 2016 to 2019, with the second top provider receiving less than 15%.[1185] Public reporting suggests that, as of 2019, Google had increased the price of search ads by about 5% per year, exceeding the U.S. inflation rate at that time of 1.6%.[1186]

Several market participants told Subcommittee staff that their ad spend on Google has increased in large part because Google has made it more difficult for businesses to obtain organic traffic. Partly this follows from Google's preferencing of its own products, which compels demoted firms to pay Google for ad placement as a way to regain visibility. Another notable factor has been Google's decision to increase the number of ads posted above organic search results.

Prior to 2016, Google's design of its search results page placed 8 ads to the right of organic search listings and 3 ads above them.[1187] Google's internal communications show that, as of 2011, the rate of user engagement with right-hand side ads was declining.[1188] Since Google made money from search ads only when users clicked on them, less user engagement meant those ads were becoming less valuable to Google. In February 2011, Sridhar Ramaswamy, senior vice president of ads at Google, noted that "users are no longer looking at the [right-hand side ads]," and stated that Google either needed to "retrain people to look there by putting really good stuff there," or "live with the fact that users are going to stop looking there."[1189] By August 2011, a team at Google known as "Project

Manhattan" was working on a redesign of Google's desktop search results page that focused on reducing or eliminating right-hand side ads.[1190]

In 2016, Google rolled out the redesigned page, which eliminated the right-hand side ads while adding a fourth ad above organic listings and 3 at the bottom of the page.[1191] The practical effect of adding a fourth ad at the top of the search results page was to push organic listings further down, requiring users to scroll down further before reaching a non-paid result. According to *Bloomberg*, when Google tested the addition of a fourth ad, some employees objected on the grounds that the fourth ad would be of lower quality than the first organic result, but Google altered the search results page anyway.[1192]

Google's decision to monetize a fourth ad at the expense of an organic listing fits a broader pattern of steps taken by Google to rank search results based on what is best for Google, rather than what is best for search users—be it preferencing its own vertical sites or allocating more space for ads. Several market participants noted that Google could afford to make these changes only once it had achieved a dominant position in the market for general search and search advertising.[1193] Now that Google is "unconstrained by competitors," one market participant noted, it "consistently reserves the top of the [search engine results page] for its own vertical products or advertisements paid for through search engine marketing, pushing its rivals' organic results to the bottom, regardless of how relevant or useful they might be."[1194]

Internal data shown by one market participant to the Subcommittee demonstrates that "organic search listings have been pushed down over time, and 'click-throughs' (clicking to visit a site) on the first organic results have decreased by two-thirds over the past 3 years."[1195] The market participant's analysis also shows that the first organic listing on mobile now appears on the bottom of the third search results screen, which "effectively forces advertising customers to bid for a paid advertisement listing if they want their service or product to meaningfully reach consumers in a mobile search."[1196]

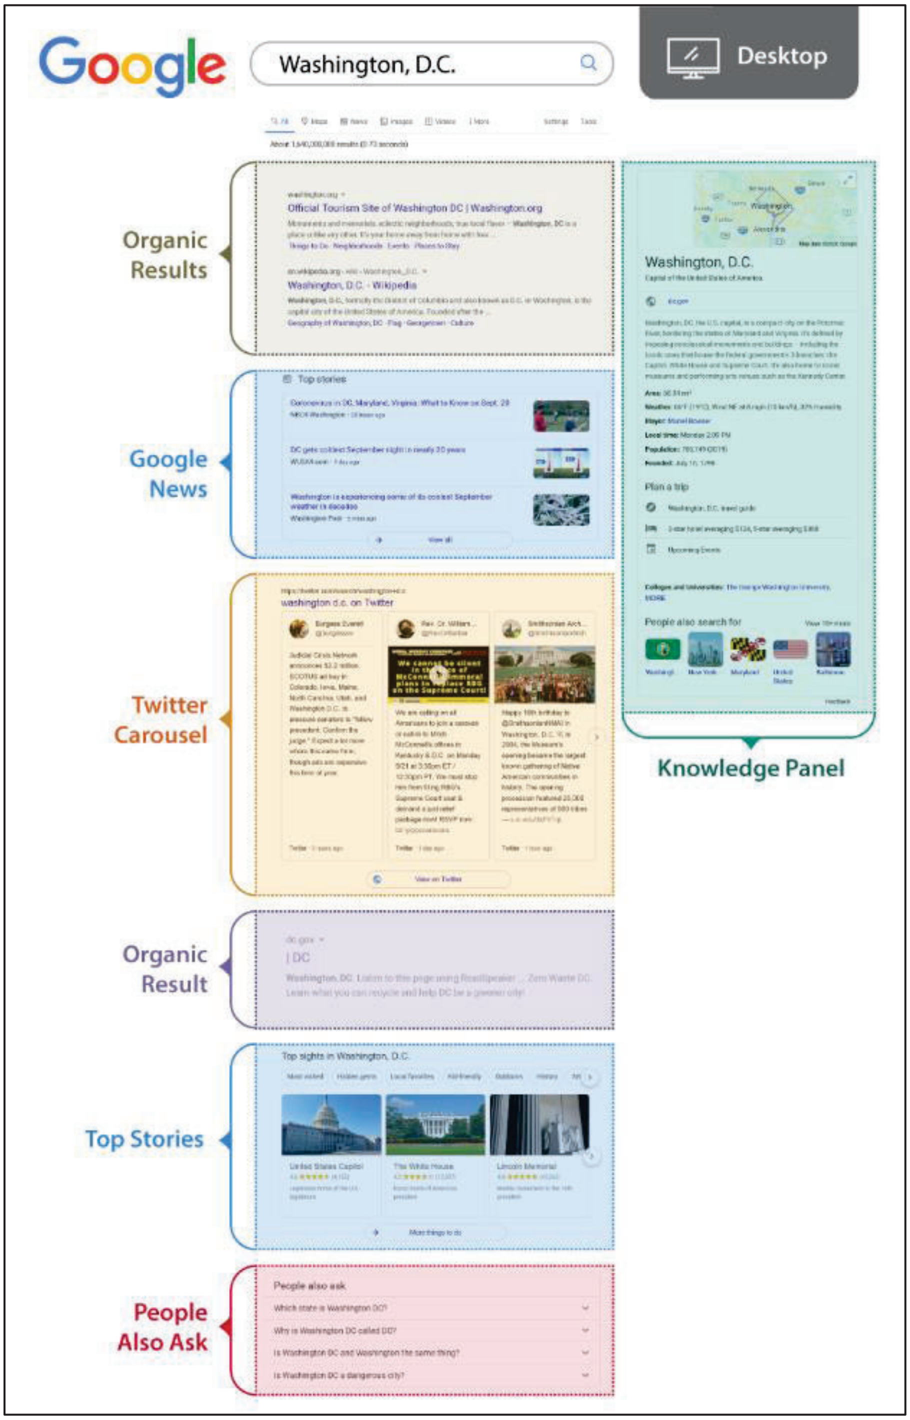
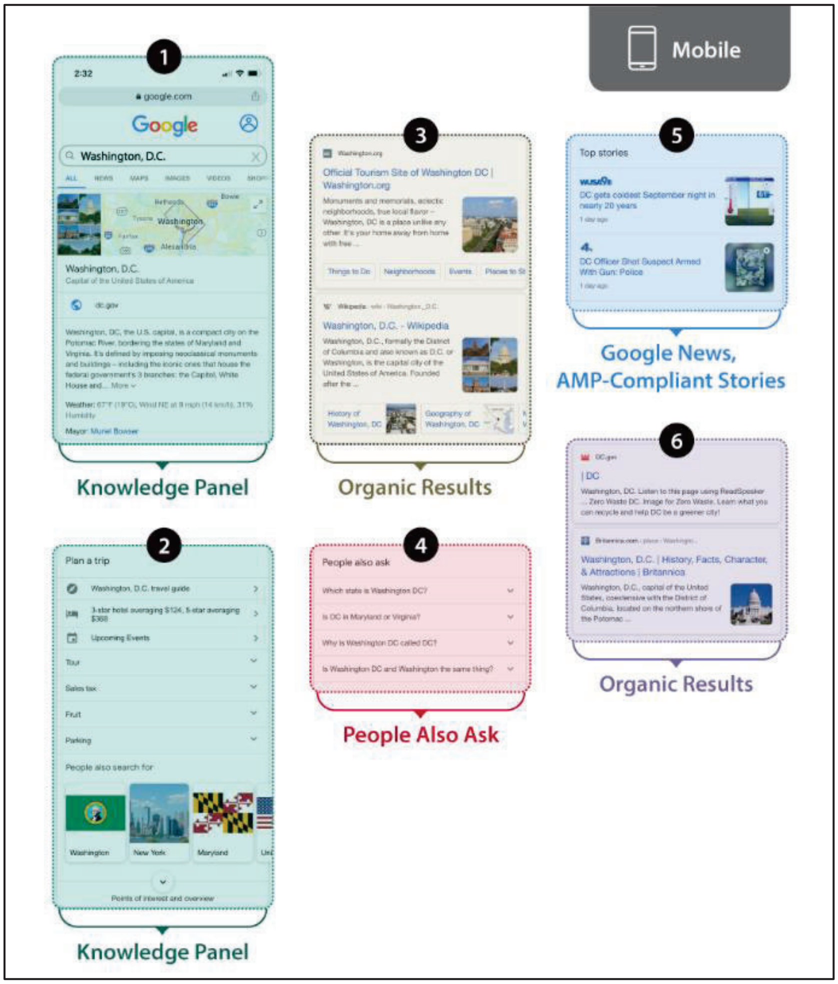
Google Search on Desktop[1199]



[1199] Prepared by the Subcomm.

Google Search on Mobile Phone[1200]



One result of these changes is that users click less on organic search results. As Google has reduced the share of top real estate that it devotes to organic listings, studies show that organic click-through as a share of all click-through plus zero-click searches has fallen.[1201] According to an analysis by Rand Fishkin, the trend is especially pronounced in mobile, where organic click-through rates fell by more than 30% between January 2016 and June 2019, while paid click-through rates over that same period more than tripled.[1202]

For businesses that depend on Google to reach users, these trends amount to a toll hike, as traffic that firms could previously draw through organic listings is now increasingly pay-for-play. Instead of competing for users by offering high-quality webpages and services that should lead to

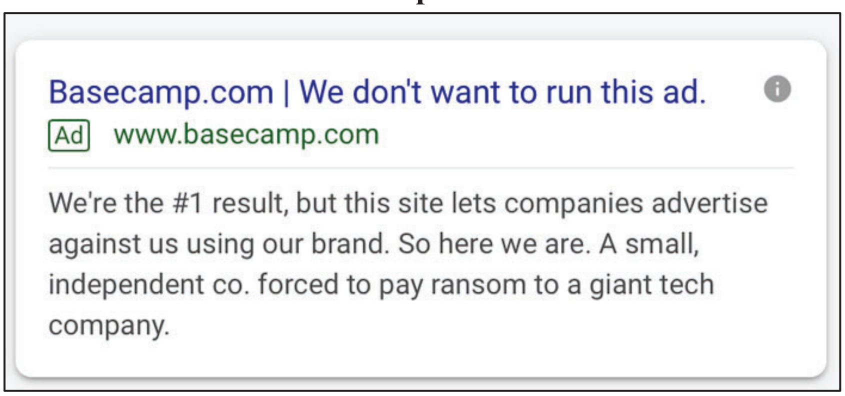
better organic search listings, these businesses must now compete for users based on how much money they pay Google. Several market participants analogized Google to a gatekeeper that is extorting users for access to its critical distribution channel.

At the Subcommittee's January 2020 field hearing in Colorado, David Heinemeier Hansson, chief technology officer and co-founder of Basecamp, testified that Google's decision to increase the number of ads listed above organic search results has hurt search users.[1203] Expanding on his criticism, Hansson stated that Google's decision to sell ad placement against a company's brand names is another way that Google extracts revenue from dependent businesses.

Hansson said, "Google uses this monopoly to extort businesses like ours to pay for the privilege that consumers who search for our trademarked brand name can find us because if we don't they will sell our brand name as misdirection to our competitors."[1204] He noted that while Google purports to recognize trademark law by prohibiting the use of trademark terms in ad copy, Google "puts the onus of enforcement on victims and does nothing to stop repeat offenders, unless, of course, the trademark terms are belonging to Google itself."[1205] Hansson added, "You will find no competitor ads for any of Google's own important properties."[1206]

Basecamp's Ad[1207]



Other market participants generally echoed these views in submissions to the Subcommittee. One wrote that Google "effectively forces its advertising customers to pay for the ability to reach

[1203] Competitors Hearing Transcript at 62 (statement of David Heinemeier Hansson, Cofounder & Chief Tech. Officer, Basecamp) ("Today, if a consumer goes to Google on their mobile device and search [sic] for Basecamp, the first thing that they will find is whoever bought that trademark term, which is usually one of our competitors. Ergo, consumers are not finding what they are looking for . . . . They are being presented with an ad and that is the tollbooth that [Google is] erecting.").

AR_003493

consumers who are searching specifically for the customer's brand."[1208] The business added, "Facing no remotely comparable advertising and search engine alternative, Google has the ability to charge potentially inflated prices for its advertising services by forcing customers to increase their bids in order to receive a more favorable position."[1209]

A second factor that several third parties cited as contributing to both higher ad prices and the degradation of search for users is Google's effort over the years to blur the distinction between organic listings and paid ads.

Google's Ad Shading and Labeling: 2007–2013[1210]

The diagram above depicts Google's practice between 2007 and 2013 of labeling its paid ads with a shaded background. As shown below, in 2013, Google abandoned the shaded background and instead inserted a small yellow square that states "Ad." Since 2016, Google has made various changes that make ads more subtle, culminating in a label that renders the overall appearance of paid ads much more similar to organic listings. Market participants have noted that Google also neglects to label some

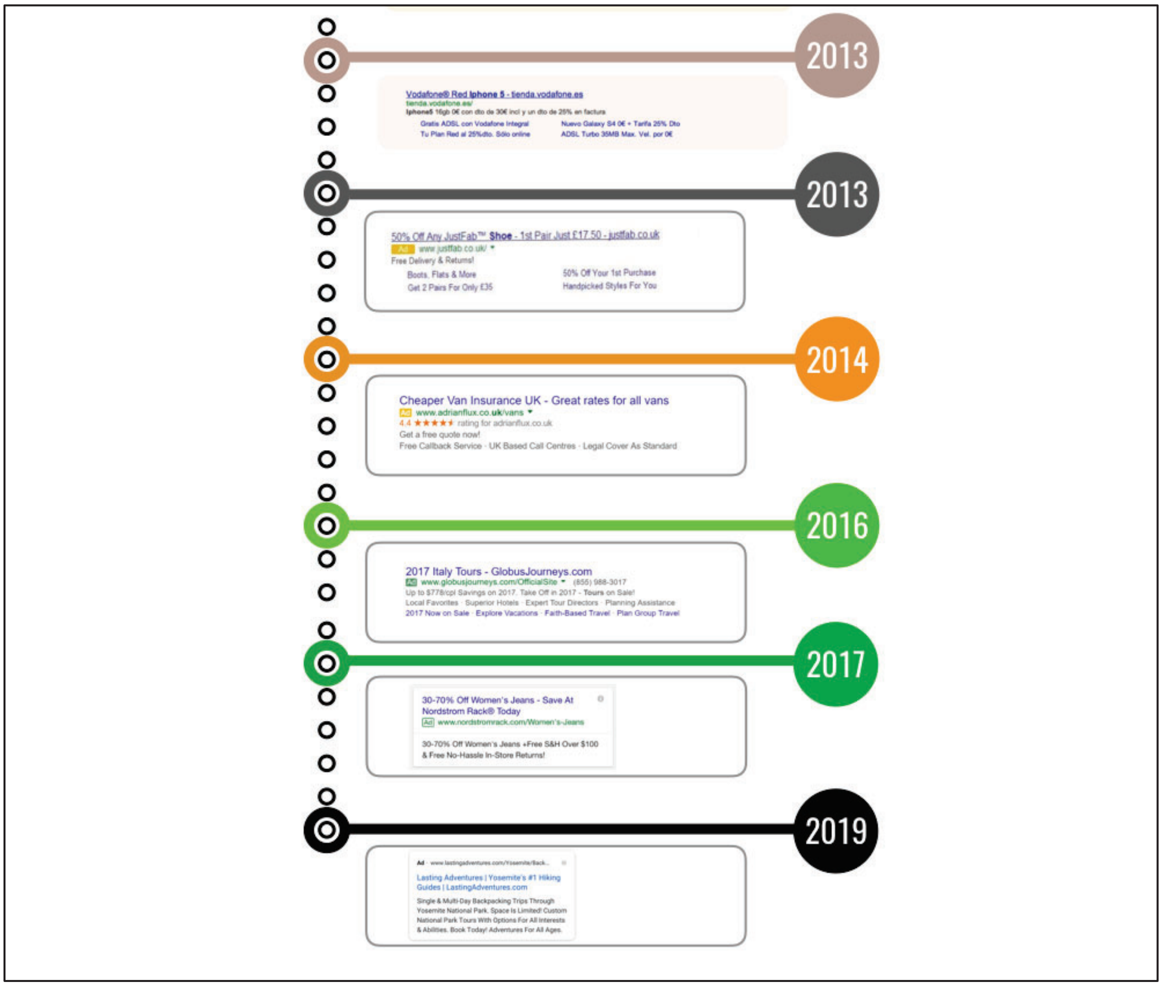
[1210] Ginny Marvin, *A Visual History of Google Ad Labeling in Search Results,* SEARCH ENGINE LAND, (Jan. 28, 2020). https://searchengineland.com/search-ad-labeling-history-google-bing-254332.

paid ads entirely, particularly those that appear in Google's vertical search offerings, such as listings for hotels that appear alongside maps.[1211]

Google's Ad Shading and Labeling: 2013–2019[1212]



The natural result of Google's decision to blur the distinction between paid ads and organic listings is that users click on more ads and less organic search results. This misleading practice has likely contributed to the growth of paid click-through rates on Google. One study found that over 59% of consumers were not aware of the difference between organic results and paid ads on Google, and about 34% of those who did recognize paid ads said they would deliberately avoid clicking on them.[1213] The Federal Trade Commission has recognized that search engines that fail to "prominently

distinguish" paid ads from organic listings could be liable for deceiving consumers under Section 5 of the FTC Act.[1214]

Making ads less conspicuous makes it more likely that users will unwittingly click on them. Market participants note that, like Google's decision to increase the number and prominence of paid ads, Google's decision to blur the distinction between paid listings and organic results deceives consumers and compels businesses to purchase ads from Google in order to be located by users.[1215]

In submissions and interviews with Subcommittee staff, businesses noted that higher advertising costs come at the expense of investments in innovation and consumer benefits.[1216] One vertical search provider stated:

> If the search market were fair, the internet would have four times more content on it, dramatically improving the web for consumers. Google's gatekeeper power allows it to show more advertisements for search queries with higher commercial intent. . . . The harm to consumers is not necessarily a lack of content, but a lack of quality content (requiring money to produce).[1217]

At the Subcommittee's January 2020 field hearing, Hansson testified that Google's conduct, which harms business customers and users alike, is enabled by its dominance:

> Google's monopoly on internet search must be broken up for the sake of a fair marketplace. Google would never be able to get away with such a user-hostile design as showing a full-page ad for something other than what you were searching for, if it had real competition. They would never have been able to establish their monopoly if this had been the design from the get-go. These are the monopoly spoils of complete domination.[1218]

At the Subcommittee's sixth hearing, Subcommittee Chairman David N. Cicilline (D-RI) noted that Google's search results page now features more ads and more of Google's own sites and asked

Google CEO Sundar Pichai whether this trend highlights a misalignment of Google's incentives.[1219] He asked, "Isn't there a fundamental conflict of interest between serving users who want to access the best and most relevant information and Google's business model, which incentivizes Google to sell ads and keep users on Google's own sites?"[1220] In response, Mr. Pichai stated that Google has "always focused on providing users the most relevant information," and stated that Google shows ads "only for a small subset of queries where the intent from users is highly commercial."[1221] However, Mr. Pichai did not explain why the percentage of queries for which Google shows ads would implicate whether or not Google's business model compromises the integrity of its search results. Google also failed to produce data that would enable the Subcommittee to make an independent assessment of Pichai's assertion.

3. Digital Advertisements

a. Overview and Dominance

Google makes the vast majority of its revenue by selling advertising placement across the internet. In 2019, Google's ad revenue accounted for approximately 83.3% of Alphabet's overall sales.[1222] Google is a prominent player in both search advertising and digital display advertising, and it captures over 50% of the market across the ad tech stack, or the set of intermediaries that advertisers and publishers must use to buy, sell, and place ads. Specifically, Google runs the leading ad exchange, while also running buy-side and sell-side intermediary platforms trade on the exchange.[1223]

Internationally, antitrust enforcers are currently investigating Google's dominance in digital advertising, including the United Kingdom's Competition and Markets Authority (CMA),[1224] and the Australian Competition and Consumer Commission (ACCC).[1225] In July 2020, the CMA concluded

that Google has "significant market power" in search advertising and its market power had enabled it to charge prices 30-40% higher than those set by Bing.[1226] In September 2020, the Senate Judiciary Committee held a hearing on the effects of Google's dominance in digital ads, where members expressed bipartisan concern that Google's market power across the ad tech stack was enabling anticompetitive conduct and harming publishers and advertisers alike.[1227] Lastly, public reports note that both the Justice Department and several state attorney generals are investigating Google's market power and conduct in digital ads, with reports that a lawsuit may be imminent.[1228] In light of the extensive attention already given to this issue, a comprehensive examination of the digital advertising market is beyond the scope of this Report.

Market participants and Google's documents suggest that Google is likely to maintain its lead in search and display advertising due to high entry barriers. Most critically, as other sections of this Report found, Google can mine its ecosystem—including Search, Chrome, Android, and Maps—to combine a unique set of user data points and build troves of online behavioral data that drive its ad business. Furthermore, its dominance across markets increasingly enables Google to set the terms of commerce. One third party described:

> Google is now not only a seller and broker of digital advertising across the Internet, but they now also control significant portions of the web browsers, operating systems, and platforms upon which these digital ads are delivered. This gives Google the ability to single-handedly shift an entire ecosystem in nearly any direction they decide, based simply on their scale. Google can then use its dominance to demand a higher share of ad revenues from buyers and sellers, and there is little leverage available to counteract this position in a negotiation.[1229]

One key factor that market participants and industry experts cite when accounting for why Google is likely to maintain its dominance in digital ads is its conflict of interest. With a sizable share in the ad exchange market, ad intermediary market, and as a leading supplier of ad space, Google simultaneously acts on behalf of publishers and advertisers, while also trading for itself—a set of conflicting interests that market participants say enable Google to favor itself and create significant information asymmetries from which Google benefits.[1230] At the Subcommittee's sixth hearing,

Representative Pramila Jayapal (D-WA) questioned Google CEO Sundar Pichai about this conflict of interest:

> So [Google is] running the marketplace, it's acting on the buy side, and it's acting on the sell side at the same time, which is a major conflict of interest. It allows you to set rates very low as a buyer of ad space from newspapers, depriving them of their ad revenue, and then also to sell high to small businesses who are very dependent on advertising on your platform. It sounds a bit like a stock market, except, unlike a stock market, there's no regulation on your ad exchange market.[1231]

Mr. Pichai responded by citing the sums that Google has paid to publishers, describing it as a "low-margin business" for Google that it pursues "because we want to help support publishers."[1232] Google's overall margins have averaged over 20% for nine of the last ten years.[1233]

b. Merger Activity

Google came to control a sizable market share across the ad tech stack through acquisitions. Google acquired DoubleClick in 2007 for $3.1 billion.[1234] At the time of the acquisition, *The New York Times* described DoubleClick as a "Nasdaq-like exchange for online ads," and Google's own early description of DoubleClick describes it as "a stock exchange," such as "the NYSE."[1235] Google purchased DoubleClick to enter the display advertising market, a segment that Google's internal documented calculated at around $4.3 billion in 2006—and an area where Google at the time noted it "has no meaningful presence."[1236] A presentation from July 2006 included a slide titled "Build a Self-Reinforcing Online Ads Ecosystem," which noted that acquiring DoubleClick or Atlas could create these "self-reinforcing benefits" for Google's ecosystem.[1237] The slide asked, "[I]s there some framework we have to demonstrate the synergies/inter-relationships from owning all these pieces?"[1238] Nine months later, Google announced its bid to buy DoubleClick.

When reviewing the deal, the Federal Trade Commission assessed both horizontal and non-horizontal theories of harm and noted that, prior to announcing the acquisition, Google had been planning to enter the market and compete against DoubleClick directly.[1239] Ultimately the Commission concluded that the display advertising market was highly competitive, and therefore the loss of Google's potential entry would not be competitively significant.[1240] Examining the potential effects of the deal on privacy, the FTC said it found no evidence that competition between Google and DoubleClick affected their respective privacy policies.[1241] In December 2007, the FTC approved the acquisition.[1242]

In 2010, Google acquired AdMob, the leading mobile ad network at the time. In the FTC's approval of the merger, it stated that "the combination of the two leading mobile advertising networks raised serious antitrust issues," but that these concerns were "overshadowed by recent developments in the market, most notably a move by Apple Computer Inc. – the maker of the iPhone – to launch its own competing mobile ad network."[1243] The Commission's assumption that Apple would continue to build its presence in the mobile ad market prompted it to approve the deal.[1244] In the coming years, however, Apple's product never fully took off and in 2016, Apple abandoned the effort completely.[1245]

In 2011 Google also acquired AdMeld, a leading supply-side platform.[1246] The Justice Department's Antitrust Division investigated the acquisition and concluded that the deal was "unlikely to cause consumer harm."[1247]

c. Conduct

i. Combination of Data

When Google purchased DoubleClick, it told Congress and the FTC that it would not combine the data collected on internet users via DoubleClick with the data collected throughout Google's ecosystem.[1248] In 2016, however, Google reversed this commitment and subsequently combined DoubleClick data with personal information collected through other Google services—effectively combining information from a user's personal identity with their location on Google Maps, information from Gmail, and their search history, along with information from numerous other Google products. At the Subcommittee's sixth hearing, Representative Val Demings (D-FL) asked Mr. Pichai about his direct involvement in the decision to renege on Google's commitment to lawmakers:

> When Google proposed the merger[,] alarm bells were raised about the access to data Google would have, specifically the ability to connect to users' personal identity with their browsing activity. Google, however, committed to Congress and to the antitrust enforcers that the deal would not reduce user privacy. Google's chief legal adviser testified before the Senate Antitrust Subcommittee that Google wouldn't be able to merge this data even if it wanted to, given contractual restrictions. But in June of 2016, Google went ahead and merged its data anyway, effectively destroying anonymity on the internet . . . Did you sign off on this decision to combine the sets of data with—that Google had told Congress would be kept separate? [1249]

Mr. Pichai confirmed that he approved the deal, claiming that "Today [we] make it very easy for users to be in control of their data."[1250] Representative Demings also noted that at the time of the transaction, DoubleClick executives had noted that Google's founders were concerned that combining the data in this way—through a cross-site cookie—would lead to a privacy backlash. She stated:

> So, in 2007, Google's founders feared making this change because they knew it would upset their users, but in 2016, Google didn't seem to care. Mr. Pichai, isn't it true that what changed between 2007 and 2016 is that Google gained enormous market power. So. While Google had to care about user privacy in 2007. It no longer had to in 2016? Would you agree that what changed was Google gained enormous market power?[1251]

[1248] Dina Srinivasan, *Why Google Dominates Advertising Markets*, 24 STAN. TECH. L. REV. (forthcoming 2020) (manuscript at 24), https://papers.ssrn.com/sol3/papers.cfm?abstract_id=3500919.

[1251] *Id*. at 74–75

She closed by noting she was concerned that Google's "bait-and-switch" was "part of a broader pattern where Google buys up companies for the purposes of surveilling Americans, and because of Google's dominance users have no choice but to surrender."[1252] In recent months, Google's reversal on this commitment has become salient for enforcers now assessing Google's bid to purchase FitBit.[1253]

ii. Other Areas of Concern

While a comprehensive examination of this market is beyond the scope of this Report, the Subcommittee heard from numerous market participants about a set of alleged practices by Google that invite investigation. These include:

- Depriving advertisers and publishers of key market and pricing information and maintaining market opacity;
- Leveraging its market power in search advertising to compel advertisers to use Google's products in the display market;
- Leveraging control over YouTube to foreclose competition in digital video ad serving, in part by excluding rival ad servers from having access to YouTube;
- Inhibiting interoperability between Google's ad platforms and non-Google ad platforms; and
- Using its search dominance to impose standards like AMP that, by further depriving publishers of user data, benefit Google's ad business.

a. Android

i. Overview

Android is a dominant mobile operating system, running on approximately 75% of the world's mobile devices.[1254] In the United States, the only alternative to Android is Apple's iOS. Android

[1252] *Id.* at 75.

[1253] CEO Hearing at 32 (response to Questions for the Record of Sundar Pichai, CEO, Alphabet Inc.), https://docs.house.gov/meetings/JU/JU05/20200729/110883/HHRG-116-JU05-20200729-QFR051-U1.pdf.

captures about 47% of the U.S. mobile operating system market, and Apple captures about 52% of it.[1255]

Google acquired Android in July 2005 for an estimated $50 million.[1256] Since then, Google has purchased a set of technologies to strengthen its mobile ecosystem, including both software and hardware.[1257] Notably, Google purchased Motorola Mobility in 2011 for $12.5 billion, the largest acquisition in Google's history.[1258]

Google describes Android as "a free, open-source mobile operating system" that is available to anyone to download and modify on a royalty-free basis.[1259] Indeed, Android is unique in that Google does not generally monetize its operating system by selling proprietary hardware or demanding licensing fees. In practice, however, smartphone manufacturers that seek to use Android must sign Google's licensing agreements, as Google limits the functionality of non-licensed usage. Only through Google's licensing agreements can smartphone manufacturers access Google's proprietary apps, such as Gmail, YouTube, Chrome, Google Maps, and Google Play Store.[1260] In return, Google requires that certain apps must be pre-installed and must receive prominent placement on mobile devices.[1261] Device manufacturers must also enter an agreement that prevents them from customizing Android,[1262] and

from building an Android fork that would make the version of Android running on a device incompatible with apps built for the Android ecosystem.[1263]

The Subcommittee's investigation revealed that Google has used Android to entrench and extend its dominance in a host of ways that undermine competition. These include: (1) using contractual restrictions and exclusivity provisions to extend Google's search monopoly from desktop to mobile and to favor its own applications; and (2) devising Android Lockbox, a covert effort to track real-time data on the usage and engagement of third-party apps, some of which were Google's competitors. Additionally, Google's Play Store now functions as a gatekeeper, which Google is increasingly using to hike fees and favor its own apps. Overall, Android's business practices reveal how Google has maintained its search dominance through relying on various contractual restrictions that blocked competition and through exploiting information asymmetries, rather than by competing on the merits.

ii. Using Contracts to Extend Google's Search Monopoly and Self-Preference

Early communications within Google show that it began investing in the mobile ecosystem because it recognized that the rise of smartphone usage threatened to disintermediate Google Search. Since losing its monopoly on search would mean losing its valuable trove of user data, maintaining dominance over search access points was paramount.

To maintain its search dominance, Google invested in Android, which it recognized it could use to extend its search dominance onto mobile devices.[1264] Google required that any smartphone manufacturer seeking to license Android preinstall Google Search and Google Play Store, alongside a host of other rotating apps selected by Google.[1265] Google also offered mobile device manufacturers revenue-share agreements, under which smartphone manufacturers would receive a cut of the search advertising revenue that Google made from the use of Google's apps on their devices,[1266] as well as a cut of Play Store revenues.[1267] In return, however, manufacturers had to not only carry Google's apps, but also ensure that Google Search was the default *and* exclusive search app pre-installed on the manufacturers' devices. For example, one revenue share agreement reviewed by the Subcommittee stated that hardware manufacturers shall not "pre-install, install, or incorporate on any Covered Device

any application which is the same or substantially similar to a Google Search Client or the Google Search Services."[1268]

Documents show that Google executives knew that conditioning access to Android and to Google's suite of apps on the prominent placement of Google Search would disrupt existing partnerships between mobile network operators and rival search engines. For example, a 2009 slide deck stated that "[p]artners may have deals in place with other search providers," and noted that "T-Mobile and AT&T have closed deals with Yahoo…Verizon has tight relationship with MSFT re: search…Expect MSFT & Yahoo to aggressively pursue 'pre-load' deals on Android phones."[1269] Google's strategy of licensing Android for free to hardware partners and conditioning access to Google's must-have apps on favorable treatment for Google Search enabled Google to box out rivals in mobile search and other markets. Google's strategy was successful. These agreements, which were reached with the leading smartphone providers, solidified Google Search as the default search option on a majority of the world's smartphones.

As Android gained market share, its demands grew and hardened. The European Commission found that between 2009 and 2014, Google increased the number of pre-installed Google apps that it required from 12 to 30.[1270] Documents submitted to the Subcommittee also show that instructions to heavily push Google Search were coming from the company's top management. Summarizing a meeting with Sundar Pichai, then-Vice President of Product Development, Director of Engineering for Android Patrick Brady recalled, "His main feedback was . . . Search is sacred, must be front and center."[1271] He added, "Our proposal covers that through more prescriptive search placement requirements."[1272]

Google's licensing agreement gave Google the right to amend the list of apps it required device manufacturers to pre-install.[1273] Documents show that market participants expressed frustration at Google's ability to set the terms and also change them routinely. Explaining the situation, Mr. Brady wrote, "Some OEMs . . . do not like the idea of signing up to undefined requirements, but most of our partners are somewhat used to this as the [c]ompatibility requirements evolve with each release, and our [Google Mobile Services] suite expands (incl. mandatory apps) over time."[1274] When one hardware manufacturer attempted to secure additional rights, Google pushed back. In 2014, John Lagerling, Senior Director of Android Global Partnerships, responded to such an effort:

> In your redlines on [the contract], you are suggesting [OEM] approves any new additions to GMS. This has never been the case in our past history[,] and I think it is the wrong message for [OEM] to send Google. We just spent some hours explaining . . . that one of the main reasons we do Android is in order to secure distribution of Google services.[1275]

Other smartphone manufacturers also attempted to resist Google's terms, noting that the requirements were crowding out placement for other apps while also taking up significant memory. For example, in 2014 one hardware manufacturer requested that Google "reduce the number of preloaded apps on the device . . . so that we don't clutter our products with apps that may not be necessary for the majority of users and we give them as much space as possible," adding that this would also "help us deal with complaints from governments, NGOs and end users."[1276] Forwarding the email to others at Google, Mr. Langerling noted that the manufacturer's grievance was "not about clutter but about system memory," adding that "[u]sers have been complaining to [the device maker] that [it] sells them a 16Gb phone and delivers something that only has 7-8Gb free."[1277]

Despite complaints that Android's pre-install conditions favored Google's products at the expense of user experience, Google maintained its requirements. Interviews with market participants suggest that Google's ability to set the terms of commerce hurt mobile device manufacturers as well as third-party developers, both of which had their own apps they were seeking to distribute. In a submission to the Subcommittee, one third party recalled being informed by a device manufacturer "that it could not provide home screen placement for our preloaded app due in part to contractual agreements to preload [Google's competing app]."[1278]

Market participants noted that pre-installation on devices can be critical for successful distribution. One developer explained that "integration into the initial device setup," in particular, can "meaningfully drive the acquisition of new users."[1279] Google's documents show that it recognized the importance of pre-installation, with one internal presentation stating that "activation and defaults are a known issue that we should explore, as OEM/carrier pre-installed apps are among the most used."[1280]

Documents also show that Google uses its leverage to push hardware manufacturers to privilege Google's products over the manufacturers' products. Discussing the agenda for an upcoming

meeting with a hardware manufacturer, one Google manager noted that the manufacturer should discourage the use of its email client for Gmail accounts, stating, "They should use Gmail native app."[1281] In a separate discussion in 2016, Google employees explained how Android Pay, a predecessor to Google Pay, would be given preferential treatment over the manufacturer's own mobile payment app.[1282] Recent reporting that Google is pressuring Samsung to promote Google apps over those offered by Samsung is consistent with the company's past conduct.[1283]

Lastly, Google appears to use its licensing agreements to deter mobile device manufacturers from collaborating with alternative mobile operating system providers. In 2012, for example, Acer, a hardware manufacturer, and Alibaba had planned to release a variant of Android, called Aliyun OS.[1284] Reporting suggests that Google threatened to terminate its partnership with Acer in retaliation, leading Acer to cancel the launch of devices running on the Aliyun OS.[1285] Google also requires hardware partners to agree that they will not run unsanctioned versions of Android on other hardware products, with the understanding that any manufacturer who violates this condition risks losing access to the Google Play Store and other popular apps across all of the manufacturer's devices.[1286]

After investigating Google's licensing agreements, the European Commission concluded in 2018 that Google's conduct had illegally benefited Google's own services while blocking the rise of rival operating systems.[1287] Although Google argued that users were free to download other apps and that Google's own apps were superior, the Commission determined that "users who find search and

browser apps pre-installed on their devices are likely to stick to these apps."[1288] Responding to Google's claims that its tying agreements were necessary in order for Google to be able to monetize its investment in Android, the European Commission stated:

> Google achieves billions of dollars in annual revenues with the Google Play Store alone, it collects a lot of data that is valuable to Google's search and advertising business from Android devices, and it would still have benefitted from a significant stream of revenue from search advertising without the restrictions.[1289]

iii. Accessing Real-Time Market Data

The Subcommittee's investigation also revealed that Android gives Google unparalleled access to data on its users and developers. This includes information that Google can monetize through its ad business, as well as strategic intelligence that lets Google track emerging competitors and general business trends.

Android's dominance in the mobile operating system market enables it to extensively surveil its users. This surveillance is partly enabled through Google's technology. In key ways Google also uses its dominance and its integration across markets to increase the number of touchpoints from which it is constantly mining user data.

Google's documents show that it has used its leverage over hardware manufacturers to demand that they structure their devices in ways that facilitate Google's data collection efforts. Google's agreements with device manufacturers, for example, require that manufacturers configure a "Client ID," which is a unique alphanumeric code incorporated in the smartphone that enables Google to combine metrics tracked via the hardware with all the other data Google collects on users.[1290] Additionally, Google's own documents also show that it has asked device manufacturers to use a Google Account as their identifier rather than a non-Google account—a way of ensuring that Google can capture a broader picture of its users.[1291] On the Play Store, meanwhile, Google does not permit users to download apps unless they have a Google Account, further funneling users into the Google ecosystem.[1292] Combined with location data, which Android also extensively collects, Google can build sophisticated user profiles reflecting a person's demographic, where they are, and where they go, as well as which apps they use at what time and for how long.[1293] These intimate user profiles,

spanning billions of people, are a key source of Google's advantage in its ad business. In this way, Android's location data feeds into Google's dominance in ads.

Documents and information reviewed by Subcommittee staff also show that Google has used Android to closely monitor competing apps, data that amounts to near-perfect market intelligence. Since at least 2012, Google has collected installation metrics for third-party apps, [1294] which it combined with data analyzing search queries.[1295] These early documents outline the early stages of Google's "Lockbox," a project to collate data that provided Google with a range of competitor insights and market intelligence, ranging from an understanding of how installation of the Amazon app corresponded to a trend in Amazon shopping queries[1296] to a close tracking of trends relating to Candy Crush and Angry Birds.[1297]

While Lockbox began as a way to collect data on the installation of apps, Google quickly realized it could harness it to yield other insights as well. One document from 2013 identified a list of additional data points that the company desired, including "[m]ore signals (including uninstalls and device app mapping)" and "reliable and long term app usage data," for which the document noted Google Play Services could help.[1298] In short, Google began seeking out ways to collect specific usage data that enabled Google to track not just which apps a user has, but also how frequently they use the apps and for how long.

Documents obtained by the Subcommittee suggest that by 2015, Google's Lockbox data had succeeded in tracking more than just install rates.[1299] Google's internal reports show that Google was tracking in real-time the average number of days users were active on any particular app,[1300] as well as their "total time spent" in first- and third-party apps.[1301] Google subsequently used this data to benchmark the company's first-party apps against third-party apps, suggesting that Google was using Lockbox data to assess the relative strengths and weaknesses of its own offerings.[1302] Google's documents show how Lockbox furnishes Google with near-perfect market intelligence, which Google has used to inform strategic moves and potential business transactions.[1303] Recent reporting by *The*

Information documented how YouTube employees used Lockbox data to track TikTok usage in India as Google was developing and planning its own rival to TikTok.[1304]

During the Subcommittee's sixth hearing, Subcommittee Vice Chairman Joe Neguse (D-CO) asked Mr. Pichai about allegations that Google had used Android to surveil rival apps and develop competing products.[1305] Mr. Pichai responded, "Congressman, because we try to understand what's going on in [the] market and we are aware of, you know, popularity of apps," adding, "But, in general, the primary use for that data is to improve the health of Android."[1306]

In follow-up questions to Mr. Pichai, Google was asked to identify all acquisitions or product decisions that had been informed by data from Android Lockbox. Google's answer was not responsive to the question.[1307]

b. Play Store

The Play Store is the dominant app store on Android devices. Early documents reviewed by the Subcommittee show that Google chose for a single app store to control software distribution on the Android ecosystem, with one executive noting that "we would strongly prefer to have one Market that everyone focuses on."[1308]

Because Google's Play Store is the primary way that users install applications on Android devices, the Play Store effectively functions as a gatekeeper for software distribution on a majority of the world's mobile devices. The Subcommittee's investigation reveals that Google uses this gatekeeper power in several key ways.

First, Google uses its Play Store gatekeeper power to charge high fees to mobile developers. Amazon, Spotify, Netflix, Epic Games, and Tinder have all expressed public concerns about Google's app store fees, along with Apple.[1309] As a lawsuit recently filed by Epic Games stated, "Google has thus installed itself as an unavoidable middleman for app developers who wish to reach Android users and vice versa. Google uses this monopoly power to impose a tax that siphons monopoly profits for

itself every time an app developer transacts with a consumer for the sale of an app or in-app digital content."[1310]

Although Google doesn't block off all alternative channels for accessing apps—allowing, for example, both some app stores and sideloading—in practice, these options do not provide meaningful alternatives to the Google Play Store. In contrast, the dual dominance of the Play Store and the Android ecosystem enables Google to exert control and engage in conduct that harms competition by exploiting, excluding, and discriminating against rivals.

Google charges developers of paid apps a 30% commission for downloads from the Play Store.[1311] Google also charges developers a 30% fee for in-app purchases.[1312] According to documents obtained by the Subcommittee, from 2011 to 2015, revenue from the Play Store accounted for 85% of Google's total revenue from the Android operating system, hardware sales, and the Play Store." [1313]

Third-party apps can also avoid the Play Store's commissions and fees by directing consumers to sideload the app, that is, to install the app using a browser, outside of an app store. Rival app stores that are not pre-installed on the device, such as the Amazon Appstore, must be sideloaded. Although sideloading is technically an option for rival app stores and app developers, market participants explained that Google goes out of its way to make sideloading difficult. Epic's recent lawsuit against Google alleges:

> Google ensures that the Android process is technically complex, confusing and threatening, filled with dire warnings that scare most consumers into abandoning the lengthy process. For example, depending on the version of Android running on a mobile device, downloading and installing *Fortnite* on an Android device could take as many as 16 steps or more, including requiring the user to make changes to the device's default settings and manually granting various permissions while being warned that doing so is dangerous.[1314]

Additionally, Epic's complaint notes that when it attempted to work with LG, another Android device manufacturer, LG told Epic that it had a contract with Google "to block side downloading off

Google Play Store this year."[1315] If a user is able to install the competing app store, Google blocks them "from offering basic functions, such as automatic updating of apps in the background, which is available for apps downloaded from the Google Play Store."[1316]

The Play Store's dominance over app distribution on Android devices has enabled Google to begin to require the use of its in-app payment system (IAP). As a result, Google has become the middleman between app developers and their customers. This was not always the case. Market participants explain that Google has changed its stance and re-interpreted policies over time to require more app developers to use Google Pay. Beginning in 2014, for example, Google designated specific categories of applications—including mobile games—that would be required to use Google Play In-App Billing.[1317] Recently, however, several market participants have informed the Subcommittee that Google has begun insisting that a broader category of apps will be required to use Google IAP exclusively, no longer allowing the option of a third-party payment processor.[1318]

In interviews with Subcommittee staff, developers state that one way Google exercises its gatekeeper power over third-party app developers is through its arbitrary and unaccountable enforcement of Play Store policies. One developer that spoke with the Subcommittee described Google's Play Store policies as an "opaque system [that] threatens the ability of app developers to develop and compete in the market for consumers, who should ultimately determine which apps they use."[1319] Another developer explained, "When apps allegedly violate Google Play Store standards, Google does not ever explain how, other than to quote the policy above and attach pictures of the allegedly violating image. When the imagery does not fit the above definitions, app publishers such as [third party] are put in a position of having to guess how to apply these standards."[1320]

Developers also alleged that Google uses control over the Play Store to protect the dominance of its own services and stifle rivals. For example, Callsome, a mobile app that provided productive follow-up to phone calls or text messages, such as prompting a calendar entry or a reminder to text back, has sued Google and claimed it was banned from the Google Play store for "Ad Policy" violations only to later learn that a "fundamentally identical product" was able to stay and thrive in the

[1320] Submission from Source 685, to H. Comm. on the Judiciary, 8 (Oct. 15, 2019) (on file with Comm.).

Play Store.[1321] Callsome believes it was banned because of its partnership with StartApp, which—at the time—was widely considered a nascent but rising rival to Google in the Russian search market.[1322]

Subcommittee staff also spoke with several market participants that said Google has abused its control of the Play Store by using rule violations as a pretext for retaliatory conduct. For example, one third party described how soon after it ceased using Google's AdMob, an in-app ads monetization tool,[1323] Google began sending the third-party notifications of policy violations related to content the third party had included in its app for years.[1324]

In response to questions from the Subcommittee, Google stated that it "only suspends apps from the Google Play Store if it finds the app in violation of Google Play Program Policies . . . or in violation of the Developer Distribution Agreement."[1325] Google also stated that it gives developers opportunities to address what they may view as incorrect enforcement decisions of Play Store policies, adding that a "developer can easily contact the Policy Support Team (Appeals) in order to challenge the enforcement decision or receive additional clarification on the infraction."[1326]

App developers, in contrast, said that challenging a Play Store decision was like navigating a black box. One third party explained that it "tried for over a month through several channels to get a full explanation from Google of the problem and resolve it amicably. Google responded with silence, then roadblocks and runarounds."[1327] However, one third party told the Subcommittee:

> When apps allegedly violate Google Play Store standards, Google does not ever explain how, other than to quote the policy above and attach pictures of the allegedly violating image. When the imagery does not fit the above definitions, app publishers such as [third party] are put in a position of having to guess how to apply these standards.[1328]

In theory, one way that app developers could avoid Google's commissions and fees would be to negotiate with a mobile device manufacturer to have the app pre-installed on the device. In practice, however, Google's restrictive contracts with smartphone manufacturers have strictly limited—if not excluded—third-party apps from being pre-installed. In this way, Google's licensing agreements not

only preclude the vast majority of third-party apps from being pre-installed, but they also funnel those apps into the Google Play Store, subject to Google's commissions and arbitrarily enforced policies.

5. Chrome

a. Overview

Google launched its web browser, Google Chrome, in 2008.[1329] Chrome makes a significant portion of its underlying code base available through the open-source Chromium Project,[1330] which has been used to build a series of "chromium-based" browsers such as Microsoft Edge and Opera.[1331] In 2010, Google introduced the Chrome web store, which enables users to access and install browser extensions, such as Easy Ad Blocker, Grammarly, and Netflix Party.[1332]

Prior to Chrome's launch, Internet Explorer, Firefox, and Safari were the most popular browsers. Firefox leaned heavily on a partnership with Google Search, which documents show enabled Google to closely track Firefox's growth.[1333]

Chrome initially set itself apart by offering an address bar that also functioned as a Google search bar, and by enabling users to sign in to the browser, offering a faster browsing experience compared to other browsers.[1334] Chrome was also integrated with other Google products. By signing in to the browser, Chrome automatically signed users into Gmail, YouTube, and additional Google services when users visited those sites, while also allowing users to sync their bookmarks, passwords, and other browser settings.[1335] While automatic sign-in provided a more streamlined user experience, it also helped Google build more detailed user profiles by connecting activity data to the user's Google Account.[1336]

[1336] *Google Privacy Policy*, GOOGLE PRIVACY AND TERMS, https://policies.google.com/privacy (last visited on Oct. 4, 2020) ("When you're signed in, we also collect information that we store with your Google Account.").

In a 2019 presentation to the Justice Department's Antitrust Division, Google explained that it had launched Chrome as a defensive move to protect users' access to Google's products.[1337] Internally, however, Google frequently referred to Chrome as part of Google's growth strategy. For example, in 2010, one of Google's strategy documents listed Chrome as a driver of "significant value,"[1338] and Eric Schmidt gave a company-wide speech stating that the rise of cloud computing meant that the browser—the primary way users access cloud—would be increasingly critical to Google's success.[1339]

Perhaps most critically, Chrome serves as a way for Google to control the entry points for its core markets: online search and online advertising.[1340] Chrome uses Google Search as its default search engine, a default setting that market participants say Google makes it difficult to change.[1341] Chrome also provides Google with another source of user data that the company can feed into its ad business to offer behavioral ads.[1342]

b. Market Power

Chrome became a leading web browser as early as 2012.[1343] In the U.S. market, Chrome captures an estimated 59% of desktop browser usage and 37% of mobile browser usage,[1344] while capturing an estimated 66% of overall browser usage worldwide.[1345]

[1345] *Browser Market Share*, STATCOUNTER, https://gs.statcounter.com/browser-market-share/all/united-states-of-america (last visited Sept. 27, 2020).

Several factors suggest that Google is likely to maintain its lead in the browser market. First, Google has established Chrome as the default browser on the majority of Android devices, which make up around 75% of smartphones globally.[1346] While Google does allow users to change default browsers on Android, in practice users rarely do. As the United Kingdom's Competition and Markets Authority recently found, even platforms that do provide users with options often end up using "defaults and choice architecture that make it difficult for consumers to exercise this choice."[1347]

Second, Chrome is likely to remain dominant because it benefits from network effects. Web developers design and build for the Chrome browser because it has the most users, and users, in turn, are drawn to Chrome because webpages work well on it. And third, Chrome is likely to maintain its lead because Google can leverage the popularity of its apps to favor Chrome. Specifically, Google's documents show that the company has focused on designing Chrome features to provide a better experience of apps like YouTube and Search, advantages that other browsers lack.

c. Conduct

Google used its search engine dominance and control over the Android operating system to grow its share of the web browser market and favor its other lines of business. Reciprocally, Chrome's dominance in the browser market gives it significant gatekeeper power over managing and monitoring users' browsing activity—power Google can wield to shape outcomes across markets for search, mobile operating systems, and digital advertising. These advantages across markets feed back into and reinforce one another, advantages that standalone browsers lack.

i. Exploiting Information Asymmetries

Even before it developed Chrome, Google's search business and popular web-based applications gave it unique insights into the browser market. Because Google.com is accessible through all browsers, Google Search usage data includes data on the browser where the search query began. Documents show that Google used search origination trends as early as 2004 to track Firefox's growth—and Internet Explorer's decline—in the browser market. [1348] Google's collection of Google Apps has also enabled it to monitor browser growth and performance. For example, in 2009 a Chrome team member explained:

> I've looked at the Gmail numbers a little—enough to know that we have per-browser breakdowns of performance already. In the Gmail case, it's quite clear which browsers

[1346] *Mobile operating systems' market share worldwide from January 2012 to July 2020,* STATISTA (July 2020), https://www.statista.com/statistics/272698/global-market-share-held-by-mobile-operating-systems-since-2009/.

[1348] Production of Google, to H. Comm. on the Judiciary, GOOG-HJC-00126978–85 (November 2004) (on file with Comm.).

are faster. There are a zillion numbers we collect, including Gmail startup times. I am confident that the other Google Apps teams also have numbers. We could pull together a collection of 2-3 stats from each app, normalize the scores somehow, and produce a number.[1349]

This data from Google's adjacent lines of business helped the Chrome team track their performance against competitors. Most of Chrome's competitors then and now lack access to this type of data at Google's scale.

ii. Favoring Google's Products in Adjacent Markets

Through design choices and default settings, Google can use its dominance in any one market to favor its other lines of business. For example, when Chrome launched in 2008, Google Search was already the most popular search engine in the world.[1350] Shortly after releasing Chrome, Google began promoting the browser in the top corner of the Google.com homepage. The display was referred to internally as the "Google Chrome Promotion," and it was frequently discussed by Google's Chrome team within the company.[1351] Internet Explorer users that visited Google's home page would see the Google Chrome installation button in the top-right corner, as shown below:

Google Chrome Promotion on Google.com Homepage[1352]

[1351] Production of Google, to H. Comm. on the Judiciary, GOOG-HJC-01465906 (Apr. 22, 2009) (on file with Comm.) ("We've been experimenting with some novel homepage promos for Chrome in preparation for the IE8 autoupgrade [sic]. Using 0.1% experiments, we found a few that performed very well. The promo on the homepage right now should be running for IE users only."); GOOG-HJC-01164689 (Apr. 23, 2009).

[1352] Christopher Williams, *Google Chrome takes second place from Firefox*, THE TELEGRAPH (Dec. 2, 2011), https://www.telegraph.co.uk/technology/news/8930759/Google-Chrome-takes-second-place-from-Firefox.html.

At the time, several Google employees expressed concerns internally that this promotion strategy was unfairly harnessing Google's search dominance to boost Chrome. In an email among Chrome employees in 2009, one employee wrote, "I find the very, very high-profile promotion of Google Chrome on Google.com quite frankly, startling."[1353] Senior executives at the company pushed to continue this strategy. For example, in 2009, Sundar Pichai, then-Vice President of Product Development, encouraged the Chrome team to "promote through Google.com" and to push users to set Chrome as their default browser.[1354]

This strategy drove significant growth to Chrome. In 2009, Director of Product Management Brian Rakowski informed his team that the promotion was "performing exceptionally well" and was "driving tremendous number of downloads."[1355] When Google halted the promotion, Chrome's growth rate dropped. In 2011, Chrome employees noted that "organic growth slowed a bit because our homepage promo was down for a couple of weeks."[1356]

Market participants view this behavior as an example of how Chrome does not compete on the merits. One firm stated, "Google has abused its dominant position in the search space to build up another dominant position in the browser space."[1357] In response to questions about this use of Google's search page, Google told the Subcommittee that these "promotional campaigns on Google.com on Internet Explorer have been run for over a decade."[1358]

Google has reinforced its market power in the browser market through its dominance in the mobile operating system market. Chrome is preinstalled on every mobile device that runs Google's Android operating system, and Android powers approximately 75% of the world's mobile devices. Beginning in 2014, Google mandated that Chrome be pre-installed and prominently placed on all certified Android devices that had entered a Mobile Application Distribution Agreement (MADA), which grants smartphone manufacturers access to Google's Play Store and other proprietary Google applications.[1359] During negotiations with Android manufacturers for revenue share agreements, meanwhile, Google required that Chrome be set as the default browser.[1360]

[1353] Production of Google, to H. Comm. on the Judiciary, GOOG-HJC-01465903 (Apr. 22, 2009) (on file with Comm.) ("I find the very, very high profile promotion of Google Chrome on Google.com quite frankly, startling.").

[1360] *See generally* Press Release, Eur. Comm'n, Antitrust: Commission Fines Google €4.34 Billion For Illegal Practices Regarding Android Mobile Devices To Strengthen Dominance Of Google's Search Engine (July 17, 2018), https://europa.eu/rapid/press-release_IP-18-4581_en.htm.

For the remaining portion of the global mobile phone market—Apple iOS—Google uses the popularity of its mobile applications to promote Chrome installations. Although Apple does not permit Chrome to be set as the default browser on an iPhone, Google provides users the option to use Chrome whenever a user selects a link within a Google application, such as Gmail or YouTube.[1361]

While Apple requires that Safari also be included as a choice,[1362] Google does not allow any other browser to be listed. If the user has not previously installed the Chrome browser, then the menu displays a "Get" button that prompts the user to install Google's browser.[1363]

Similarly, Google privileges its own line of businesses by setting Google Search as the default in Chrome. Although users can change this setting, the process is not intuitive and involves multiple steps, including:

1. At the top right, click More > **Settings**.
2. Under "Search engine," click **Manage search engines**.
3. Find "Other search engines."
   - **Add**: To the right of "Other search engines," click **Add**. Fill out the text fields and click **Add**.
   - **Set as default**: To the right of the search engine, click More > **Make default**.
   - **Edit**: To the right of the search engine, click More > **Edit**.
   - **Delete**: To the right of the search engine, click More > **Remove from list**.[1364]

One third party told the Subcommittee that in some cases, Google prompts users to change their default search engine back to Google Search even after they have switched:

> After a user installs the extension, Chrome is showing continuous warning prompts which ask users to restore their search settings back to Google. In user tests, we observe that most people are very confused about this prompt and often click "restore settings" even though they actually want to keep using [our search engine]. In many Chrome versions the button "restore settings" is even highlighted which makes it highly likely that users will click this button and thereby completely remove [our search engine] from

their computers. We believe that we have already lost millions of users because of this prompt.[1365]

iii. Unilaterally Setting Standards

By virtue of its dominance in the browser market, Google can effectively set standards for the industry in two ways.

First, changes to Chrome's functionality create *de facto* standards. Market participants must adhere to these standards or risk their technology no longer being compatible with most websites. Market participants explain that Google will often build features quickly without using the standard-setting process or giving smaller browsers time to implement new features. Once web developers start building to these specifications, however, smaller browsers are under pressure to quickly implement these changes, often with little notice.[1366] If smaller browsers cannot keep up, users are flooded with "[b]rowser not supported" messages on webpages that have already been built to Chrome's specifications.[1367] Several market participants told the Subcommittee that they felt "bullied" by this process.[1368]

Second, Google has an outsized role in the formal stakeholder standards-making processes. As explained earlier in this Report, the World Wide Web Consortium (W3C) is one of the leading standards organizations in the browser market. Its stated mission is to be "open and collectively empowering."[1369] Other market participants believe that Google is significantly overrepresented in the W3C web platform incubator community group (WICG). They note that Google's employees comprise 106 members, more than eight times the number of employees from Microsoft, the next largest stakeholder represented. Most companies, meanwhile, have only one representative.[1370] One market participant said:

> Though standards bodies like the W3C give the impression of being a place where browser vendors collaborate to improve the web platform; in reality Google's monopoly position and aggressive rate of shipping non-standard features frequently reduce standards bodies to codifying web features and decisions Google has already made.[1371]

AR_003520

Recent events underscore how Google's ad-based business model can prompt questions about whether the standards Google chooses to introduce are ultimately designed primarily to serve Google's interests. In January 2020, Google announced that it plans to phase out third-party cookies in Chrome within two years.[1372] Unlike other browsers that have limited cross-site tracking, Google's decision appears to be motivated by "trying to cut down on tracking without kneecapping revenue for websites."[1373]

Several observers have noted that this change would have the likely effect of reinforcing Google's power and harming rivals, shifting more advertisers toward Google.[1374] In particular, market participants are concerned that while Google phases out third-party cookies needed by other digital advertising companies, Google can still rely on data collected throughout its ecosystem.

During the Subcommittee's sixth hearing, Representative Kelly Armstrong (R-ND) asked Mr. Pichai, "[D]o you have other ways of collecting it [data] through Gmail or consumer facing platforms?"[1375] Mr. Pichai responded, "[T]o the extent on the services where we provide ads and if users have consented to ads personalization, yes, we do have data."[1376]

6. Maps

a. Overview

Google dominates the market for digital maps with over a billion users.[1377] Between Google Maps and Waze—which Google also owns—the corporation captures an estimated 80% of the navigation app market.[1378] Financial analysts have described navigation maps as a "utility" that people cannot do without,[1379] and one bank estimated that if Google Maps were a standalone product, its market capitalization would hit $61.5 billion.[1380]

[1380] ROSS SANDLER, BARCLAYS, ALPHABET INC., STEADY COMPOUNDER, WITH PLENTY OF INNOVATION AHEAD 20 (Mar. 28, 2017) (on file with Comm.).

Google Maps can be traced to a series of acquisitions. In September 2003, Google Labs launched "Search by Location," a feature that sought to filter search results based on a user's geographic location.[1381] Because Google lacked mapping data, however, the feature stalled.[1382] In October 2004, a few months after Google's IPO, Google acquired Where 2 Technologies, an Australian startup that created web-based dynamic maps.[1383] Google soon followed this acquisition with two additional purchases: Keyhole, a firm that used satellite images and aerial photos to create digital-mapping software, and ZipDash, a provider of real-time traffic information captured through GPS.[1384] In February 2005, Google launched Google Maps.[1385]

The following year, Google introduced Google Maps API, which enabled developers to use and build on top of its digital maps.[1386] In 2008, it launched "Ground Truth," a project devoted to assembling and refining underlying mapping data and images.[1387] This effort included Google Street View Cars, which drove around the country—and, eventually, the world—taking pictures of the surrounding buildings and landscapes, and delivering Google structured data that it could use to create digital maps.[1388] As part of Project Ground Truth, Google also obtained mapping information from satellite and aerial imagery, as well as from public databases.[1389]

A 2008 budget request for Ground Truth stated that the goal of the project was "long term independence from Tele Atlas and Navteq," two sources of mapping data that Google had been using at the time and that were owned by TomTom and Nokia, respectively.[1390] The presentation stated that achieving independence would take several years and requested a 5- to 7-year renewal of the Tele

Atlas contract to help Google bridge "between now and completion of Google Truth initiatives."[1391] Although Google Maps was not generating revenues, Google was investing in it heavily. Google's documents show that from 2008 to 2009, the company spent $32 million on the Street View program and $88.7 million on Ground Truth overall.[1392] When Google launched Google Maps in 2005, MapQuest had been the "king of Internet-based maps and driving directions," with Yahoo gearing up to heavily compete.[1393] By 2008, Google's internal documents show that Google was "#1 in Maps usage" as well as at the top in capturing online local search.[1394]

In 2009, Google introduced Google Maps for Mobile, a navigation service featuring turn-by-turn directions, live traffic updates, and automatic rerouting.[1395] Whereas market leaders TomTom and Garmin sold navigation services through subscriptions, Google was offering its service for free[1396]—a fact widely seen as disfavoring the incumbents, whose stock prices fell upon Google's announcement.[1397] As one analyst noted at the time, "If it's free and a good service, why would you pay for something you can get for free?"[1398]

As smartphones overtook personal navigation devices, Google Maps further eclipsed TomTom and Garmin.[1399] When asked in 2015 what had accounted for TomTom's decline, its CEO cited two factors: the 2008 economic crisis and the fact that "Google began offering navigation for free."[1400]

Some market participants at the time questioned whether Google was using its search dominance to give Google Maps a boost. In 2009, one publisher noted that "61% of visits to Google

Maps came directly from Google," giving it an advantage over MapQuest.[1401] The publisher wrote, "As long as Google dominates search, MapQuest will face a tough battle for visits."[1402] A few years later, Consumer Watchdog wrote a letter to the Antitrust Division noting that Google "was able to muscle its way to dominance by unfairly favoring its own service ahead of such competitors as Mapquest in its online search results."[1403]

In 2013, Google purchased Waze, an Israeli crowd-sourced mapping provider, for $1.3 billion.[1404] The acquisition solidified Google's dominance in turn-by-turn navigation, eliminating its only meaningful competitive threat.

While Google captured the navigation market by offering Google Maps for free, even as it generated no revenue, Google now monetizes both Waze and Google Maps through selling ads. In 2013 Google introduced a limited form of maps advertising, and in recent years it has expanded the program, allowing local businesses to purchase advertising on maps to maximize foot traffic.[1405] Research by Google shows that 76% of users who search for locations nearby end up visiting a related business within a day and that 28% of those searches ultimately lead to a purchase.[1406] This high conversion rate leads analysts to believe that Google Maps alone could help drive between $1.9 billion and $3.7 billion of incremental revenue by 2021.[1407] Commenting on the value of Google Maps to the Google ecosystem, one analyst noted:

> [Google Maps'] user base has been impressive for years, crossing 1B a few years ago, but monetization is just getting started … Maps is the closest thing to a platform that Google has at the application layer, with three stakeholders in the ecosystem: 1) users; 2) publishers; and 3) advertisers. The importance of Maps to mobile, including both the advertising and transportation-on-demand spaces, is one of the biggest potential markets Google is servicing in the future.[1408]

b. Market Power

Google Maps is the dominant provider of mapping data and turn-by-turn navigation services. The company declined to provide the Committee with information about the market share captured by Google Maps.[1409] According to a third-party estimate, however, Google Maps combined with Waze captures 81% of the market for turn-by-turn navigation services.[1410] One market participant, meanwhile, estimated that Google Maps API captures over 90% of the business-to-business market.[1411]

Several developers stated that Google Maps introduced greater licensing restrictions as it gained a stronger market position. One noted that Google's control over what now serves as a key mapping technology has allowed Google to call all the shots.[1412] "We license Google Maps and it's essentially a contract of adhesion. It's full of restrictions and we aren't able to negotiate any changes," the developer said.[1413] The developer added that they have explored switching to alternative mapping providers, but that no other provider has the same geographic depth and coverage as Google Maps. "Other providers still value us and want to know how they can accommodate us," they said. "With Google, we just have to comply with all their restrictions."[1414]

Several factors suggest that Google Maps is well-positioned to maintain its dominance. The high fixed costs of creating mapping data pose a significant barrier to entry. Apple, which recently built its mapping database from the ground up, told the Subcommittee that the effort required billions of dollars.[1415] Google, moreover, also benefits from an enormous lead in the tracking and processing of location data, as well as from the prevalence of tracking-enabled Android devices.[1416] Commenting on

[1409] Production of Google, to H. Comm. on the Judiciary, A-4 (Nov. 22, 2019) (on file with Comm.) ("Google Maps has a number of features, including maps, turn-by-turn navigation and directions, Street View, and information on local businesses (such as restaurants and services)and travel destinations (such as hotels and tourist spots) that are also offered by competitors. These competitors include Apple Maps, Bing Maps, TomTom, Yelp, TripAdvisor, Angie's List, and Facebook . . . . All of these competitors are widely used, with some having a strong presence on key platforms: for example, one report from 2015 estimated that iPhone users use Apple Maps three times more than Google Maps. However, we are not aware of any public market share estimates that reflect the frequency of multi-homing among users or that account for competitors like TripAdvisor, OpenTable, Yelp, or directory apps such as Yellow Pages that overlap with many of the features of Google Maps, which would reflect the full range of robust competition in maps that drives Google to continually invest and innovate in the Google Maps product.").

its monetization potential, an analyst recently wrote that Google Maps has "reasonably sustainable moats."[1417]

Certain businesses have made public disclosures about their reliance on Google Maps. For example, in 2019, Uber disclosed that it relies on Google Maps for "the mapping function that is critical to the functionality" of its platform.[1418] It added, "We do not believe that an alternative mapping solution exists that can provide the global functionality that we require to offer our platform in all of the markets in which we operate."[1419] Uber disclosed that between January 1, 2016 and December 31, 2018, the company paid Google $58 million for use of Google Maps.[1420]

In a submission to the Subcommittee, one market participant who uses Google Maps to power its reservation system, website, and mobile app, stated that there are no alternatives to using Google Maps. It wrote, "Local businesses are most likely to use Google's tools to index their websites because Google controls the search engine space, which has the ability to deliver—or restrict—whether these websites appear in corresponding links in consumer search results."[1421] The market participant added that this dependence reinforces Google's market power, as it "provides Google with another opportunity to monetize companies' supply chains and leverage its pricing power over companies that need to promote their businesses and/or purchase ad space to grow."[1422] This business predicted that "the data advantages that Google incorporates into its tools will only grow with time, making it impossible for a new player to ever achieve the scale, user base, or database necessary to compete."[1423]

c. Merger Activity

Google has made several acquisitions related to digital mapping: Where2Technologies (2004); Keyhole (2004); Skybox (2011); and Waze (2013). Of these acquisitions, only Waze—for which Google paid $1.1 billion—was subject to an antitrust investigation. Although Google did not originally report the Waze transaction, both the Federal Trade Commission and the United Kingdom's Office of Fair Trading (OFT) reviewed the deal.[1424] Both enforcers initially approved the transaction but have

[1424] Mark Bergen & Ben Brody, *Google's Waze Deal Is a Likely Target in FTC Antitrust Sweep*, BLOOMBERG (Feb. 14, 2020), https://www.bloomberg.com/news/articles/2020-02-14/google-s-waze-deal-is-a-likely-target-in-new-ftc-antitrust-sweep.

since revisited the decision. In 2019 the OFT commissioned a study reviewing its past merger cases, including Google/Waze, and the FTC is reportedly examining the Waze deal as part of its broader review of previous tech mergers.[1425]

Materials that the FTC produced to the Subcommittee suggest that the Commission's analysis of the Google/Waze deal was limited. A document from the FTC shows that the agency focused on assessing the quality of Waze's data and concluded that its maps were "not a Google maps replacement."[1426] It is unclear if or how closely the agency considered that Google was acquiring Waze not for its mapping features (which Google's own documents had suggested were inferior to Google's), but in order to eliminate an independent source of mapping data.[1427]

In acquiring Waze, Google bought out one of the few companies in the world making navigable maps while also providing turn-by-turn navigation service.[1428] Founded in Israel, Waze had entered the U.S. market by initially relying on public domain public data, which it refined through input from drivers.[1429] Waze's model has relied on user-generated maps, whereby drivers using Waze's app feed real-time data back into the app, and volunteer "editors" proactively fine-tune the maps by fixing street names, adding businesses, and making other updates. Waze's documents reveal that through 2012 the firm had prioritized achieving growth and attracting users over earning revenue, although it had begun to monetize its navigation app through location-based advertising.[1430]

Internal Waze presentations stated that its crowd-sourced data was one of the company's defining features. One presentation stated, "The DNA of the company is of a social network, and user generated, we are merely the stage, and not the performers."[1431] In a 2013 document, Waze identified its two main competitive advantages: first, the fact that Waze was a real-time map with fresh data, accounting for updates such as car accidents and road closures; and, second, that its business involved "zero cost."[1432]

Google's documents reveal that by 2012, Google Maps was the top provider of digital maps in desktop, mobile, and API,[1433] and it was closely tracking Waze's fast growth. One Google presentation

in 2012 noted that Waze was the most-downloaded app in the navigation category, and that it was seeing a 30% increase in daily downloads and averaging around 100,000 downloads a day.[1434] Google also honed in on the fact that Waze was the only other mapping provider that was vertically integrated across the full stack, spanning the provider, application, map, traffic, and search layers.[1435]

In an internal presentation, Google identified several strategic rationales for acquiring Waze.[1436] These included obtaining a "highly-engaged community of map contributors and expertise" in order to "nurture/grow communities," which Google said it struggled with; achieving a "scalable solution" for maintaining a fresh map with "real-time incident data"; using Waze as a "sandbox" to "test map/navigation features"; and acquiring a "highly-talented team" with "deep experience in maps."[1437] Google also ranked Waze poorly on several metrics, including the accuracy of its results in smaller cities and its limited map search capabilities.[1438] Commenting on Waze's mapping tiles, Google wrote, "[D]ata is missing and rendering is overly simple and missing detail."[1439] Meanwhile, Google described Waze's future financial projections as "highly speculative,"[1440] and noted that its purchase price of just under $1 billion was "expensive for a company with < $1 million in 2012 revenue."[1441]

In its correspondence with the FTC, Google stated that "there is no shortage of full-featured navigation alternatives for users," which it said reflected the "low (and continually decreasing) barriers to entry."[1442] Google emphasized Waze's entry, in particular, focusing on how Waze "spent far less than $20 million *for all purposes* in the two years preceding its US launch" and noting that it was able to enter the market using only public domain data.[1443]

In contrast, market participants viewed Google and Waze as close competitors in a "highly concentrated" market for navigable digital map databases and turn-by-turn navigation applications. Prior to the transaction, Waze had observed that it and Google were "the only vertically integrated stacks."[1444] One market participant told antitrust enforcers that it viewed Waze as "Google's closest competitor for real-time, updated [turn-by-turn] navigation services" and that Waze "was the digital-

[1444] *Id.* at GOOG-HJC-04208696.

map competitor with the best opportunity to overcome Google's significant data and funding advantage."[1445]

Market participants cited a few reasons the transaction would undermine competition. First, they noted that barriers to entry in the market for turn-by-turn navigation providers were high and that it would be difficult for new firms to enter. One market participant stated, "Navigable digital map databases contain far more information than maps and addresses. For example, Google's database includes a range of other information, including traffic, conditions and rerouting information, interior and exterior photographs, reviews, commentary from Google+ friends."[1446] And Waze, in particular, had a unique crowd-sourced model that would be difficult for other firms to replicate. Although Waze had secured a "first-mover advantage" and acquired a "critical mass of users," the group of self-selected volunteers who edited Waze's maps were "unlikely to fill such a role (without payment) for more than one set of mapping data."[1447] The market participant added, "Once those editors provide the benefit of their input into Waze they create a powerful map that passive Waze users will turn to as well given the lack of other real-time-updated maps of comparable quality. As a result, passive Waze users likely will have no incentive to multi-home."[1448]

Second, market participants pointed to the fact that Waze was the only firm meaningfully positioned to dislodge Google Maps because it—like Google—lacked financial pressures. One entrepreneur noted, "Google and Waze do not care how much it costs to keep the maps up-to-date. Google because it has a lot of money, and Waze because it relies on the community."[1449] One market participant stated:

> The acquisition would effectively lead to the elimination of Waze as a market disrupting force that would otherwise be capable of challenging the model adopted by Google's dominant Google Maps. In essence, Google's acquisition of Waze is defensive - seeking to remove a disruptive force from the market.[1450]

Several market participants and advocates who opposed the deal noted that Waze's own CEO, Noam Bardin, had recently stated that Waze was "the only reasonable competition" to Google Maps, which would suggest that Google may have been pursuing the acquisition in efforts to quash its most significant competitor.[1451]

[1447] Interview with Source 572 (Sept. 24, 2020).

[1448] *Id.*

[1449] *Id.*

[1450] *Id.*

[1451] Letter from John M. Simpson, Privacy Project Dir., Consumer Watchdog, to William J. Baer, Ass't Att'y Gen., U.S. Dep't of Justice, Antitrust Div. (June 12, 2013), https://www.consumerwatchdog.org/resources/cltrdojwaze061213.pdf.

And third, market participants argued that the acquisition would give Google both the incentive and ability to foreclose rivals, including those apps that offer mobile navigation and social networking services. Seeking to mitigate this concern, Google's letter to the FTC emphasized the "numerous providers who license mapping, traffic, and incident" data for use in mobile apps.[1452]

Today, the Google Maps and Waze teams remain separate. Analysts have reported that Google has used Waze as a tool to "test and iterate on monetizing Navigation without disrupting its much larger Google Maps asset."[1453] One market participant stated, "Google has used Waze as an ads guinea pig,"[1454] noting that Waze has released efficacy reports of location-tailored ads, information that seems to have informed Google Maps' recent expansion of advertising.[1455]

Since completing the Waze acquisition, Google has reportedly come to capture 81% of the market for navigation mapping services.[1456] Despite Google's claims that entry barriers were low and alternate offerings abundant, no meaningful competitor has emerged since Google acquired Waze. Based on the materials the FTC provided to the Subcommittee, it is unclear whether the Commission fully assessed the barriers to entry. It instead appears the FTC primarily took a static view—focusing on the existing quality of Waze's maps—rather than assessing the dynamic effects of the acquisition.

d. Conduct

i. Raising Prices

For years, Google offered a free tier of the Maps API, incentivizing developers to build their apps with Google Maps. In 2018, however, Google Maps introduced a single "pay-as-you-go" pricing plan for the core mapping APIs.[1457] This shift dramatically reduced the number of free Maps API calls a firm could make—from 25,000 per day to around 930 per day.[1458] Developers stated that the change amounted to a price increase of 1,400%.[1459]

[1458] *Id*.

[1459] Ishveena Singh, *Insane, shocking, outrageous: Developers react to changes in Google Maps API*, GEO AWESOMENESS (May 3, 2018), https://geoawesomeness.com/developers-up-in-arms-over-google-maps-api-insane-price-hike/ ("The Standard (no access to customer support) and Premium plans are being merged into one pay-as-you-go pricing plan. And the new fee structure is not pretty. Google is raising its prices by more than 1,400%. Obviously, no direct comparison

In a submission to the Subcommittee, one market participant said that Google instituted this price hike after "gaining dominance."[1460] Since becoming a Google Maps customer, the market participant's costs "have increased over 20x" and "there are no viable alternatives."[1461] Another developer stated that the 2018 pricing change "took our bill from $90/month in October to $20,000/month in December."[1462] The developer stated that it was able to subsequently reduce its bill through making a change that enabled the location-retrieval function to occur directly on a user's device—a change that gave Google a "greater ability to identify and track" the device user.[1463]

Several developers expressed their frustrations publicly, noting that Google's decision to hike prices so sharply, and without giving developers significant notice, underscored its power to set the terms of commerce. One developer stated:

> I understand that Google wants to make this into a line of business. But it feels like they're taking advantage of us. They know that they're the best, and that no one else is even close. Instead of just giving us Maps for free or very cheap, in exchange for collecting all our usage data, they now feel they need to charge really high prices.[1464]

In effect, Google makes market participants pay twice to access Google Maps—first by giving Google their valuable usage data and then again by paying Google's volume-based fees for API calls.

ii. <u>Tying</u>

Business-facing mapping products usually consist of a core set of features to provide greater mapping functionality. For example, the "Google Maps Platform" offers developers traffic data and places data (also known as place search) as well as map data.[1465] Some developers choose to mix and match, using map data from one firm but placing data from another. Google, however, prohibits developers from using any part of its mapping tools alongside any non-Google mapping features. Until April 2020, Google's Maps Platform Terms of Service included the following provision:

---

figures of old and new prices have been provided by Google, but that's the average surge that is being reported by developers.").

[1465] *Google Maps Platform Terms of Service, 21. Definitions*, GOOGLE, https://cloud.google.com/maps-platform/terms (last visited on Oct. 3, 2020) ("'Google Maps Content' means any content provided through the Service (whether created by Google or its third-party licensors), including map and terrain data, imagery, traffic data, and places data (including business listings).").

> (e) No Use With Non-Google Maps. Customer will not use the Google Maps Core Services in a Customer Application that contains a non-Google map. For example, Customer will not (i) display Places listings on a non-Google map, or (ii) display Street View imagery and non-Google maps in the same Customer Application.[1466]

In April 2020, Google amended the language slightly:

> (e) No Use With Non-Google Maps. To avoid quality issues and/or brand confusion, Customer will not use the Google Maps Core Services with or near a non-Google Map in a Customer Application. For example, Customer will not (i) display or use Places content on a non-Google map, (ii) display Street View imagery and non-Google maps on the same screen, or (iii) link a Google Map to non-Google Maps content or a non-Google map.[1467]

Both versions of this provision prohibit developers from using *any* component of the Google Maps Core Service with mapping services provided by non-Google firms. The April 2020 change to the terms of service is even more restrictive: it prohibits developers from even displaying any component of Google Maps "near" any other map. In practice, Google's contractual provision has led several major companies to switch entirely to Google's ecosystem, even in cases where they preferred mapping services from a non-Google provider, such as Mapbox.

Through interviews with market participants, the Subcommittee learned that Google now enforces this provision aggressively. According to one firm, Google closely tracks and pressures developers who use Google's place data in conjunction with mapping data from a non-Google firm, effectively forcing them to choose whether they will use all of Google's mapping services or none of them.[1468] One firm described Google's coercive tactics, stating, "It's a bigger player putting a gun to our head saying 'switch or else.'"[1469]

Because Google's monopoly in online search has furnished it with a trove of data, as well as a robust index, its place search feature is also seen by many market participants effectively as a must-have. One market participant that has lost business partnerships due to Google's coercive restrictions stated that Google is "using access to its dominant search products as leverage to intimidate businesses

[1467] *Id.*

[1468] Interview with Source 572 (Sept. 24, 2020).

[1469] Interview with Source 157 (Sept. 25, 2020).

out of working with other map providers."[1470] He noted that Google's conduct now threatens his firm's survival, saying, "This is existential for us."[1471]

Google was asked to identify and justify any limits it places on the ability of app developers who use the Google Maps Platform to use non-Google mapping services.[1472] Google responded that it does "restrict developers from incorporating Google Maps Core Services into an application that uses a non-Google map" in order to "prevent brand confusion and other negative user experiences."[1473] As described above, Google subsequently changed its terms of service to mirror its response to the Subcommittee's question. However, developers and mapping providers questioned Google's rationale, noting that developers were the ones best positioned to determine whether combining mapping services from multiple providers created a "negative user experience." One provider added, "The developers we partner with are extremely sophisticated. They're not confused."[1474]

Google has also used its dominance in mapping to acquire cloud computing customers for its Google Cloud Platform (GCP). Specifically, in 2018, Google implemented a change requiring all API calls to use a valid API key, which must be linked to a Google Cloud Platform account. All keyless calls to the Maps JavaScript API and Street View API trigger low-resolution maps that are watermarked with "for development purposes only."[1475] Developers who do not have a Google Cloud account, and therefore do not have an API key, are effectively locked out of Google Maps. Even if an application is built on a non-Google cloud platform, developers are forced to use GCP for the Maps API portion of their app.[1476] By one estimate, revenue from Google Cloud Platform has more than tripled since 2017, the year before Google began tying access to Google Maps to Google Cloud Platform.[1477]

iii. Self-Preferencing through Contractual Restrictions

Some developers told the Subcommittee that Google uses its control over digital mapping to favor its own products in other lines of business. Since Google provides mapping services but also

offers non-mapping products that use mapping as an input, Google can selectively degrade access for third parties that rely on its mapping product to disfavor them as competitors to its non-mapping products. For example, market participants noted that Google has added various restrictions to the license agreement for Google Maps API—restrictions that apply to third-party developers but not to Google's own competing products.

One example is unequal rights to map caching. Map caching occurs when a server stores copies of map images that it can speedily distribute when next recalled. Without caching, a map is drawn each time it is requested, a much slower process.[1478] Although previous versions of the Google Maps API agreement permitted caching by developers, the recent versions prohibit caching of maps with limited exceptions.[1479] Third-party apps built on Google Maps API can no longer store a map cache. Market participants note, however, that Google's own products built on Google Maps—ranging from its local search service to its hotel finder—face no similar restrictions, enabling them to load faster than those run by third parties.

Commenting on the asymmetry, one market participant stated that Google's decision to deny third parties caching "denigrates the service that our maps can provide compared to Google's."[1480] They added, "[T]hat's why we can't create an app that provides directions as well as Google or we can't update a user's location as quickly as Google."[1481]

iv. Strategic Platform Mismanagement

Although Google's responses to the Subcommittees' questions about its conduct regarding Google Maps emphasized "quality" and "user experience,"[1482] public reporting has documented that Google Maps' listings are "overrun with millions of false business addresses and fake names."[1483] A fake listing can occur when a business creates a fake listing or when a fraudulent business hijacks the name of a legitimate business on Google Maps, diverting user calls or visits from the legitimate business to a fraudulent one. A survey of experts conducted by the *Wall Street Journal* estimated that

[1483] Rob Copeland & Katherine Bindley, *Millions of Business Listings on Google Maps Are Fake—and Google Profits*, WALL ST. J. (June 20, 2019), https://www.wsj.com/articles/google-maps-littered-with-fake-business-listings-harming-consumers-and-competitors-11561042283.

Google Maps hosts around 11 million falsely listed businesses on any given day.[1484] The same experts stated that "a majority" of the listings on Google Maps for businesses such as "contractors, electricians, towing and car repair services, movers and lawyers," as well as others, are not actually located at the location given by Google Maps.[1485]

These fake listings endanger consumer safety, giving rise to situations where users of Google Maps have unknowingly requested home repairs and other services from fraudulent providers, ultimately, paying inflated prices for shoddy work.[1486] The fraudulent listings also disadvantage legitimate businesses, both those whose listings have been hijacked as well as those whose own listings appear below those of sham businesses. Marketers have weaponized this problem to demand ransom payments from businesses under the threat of wiping out their listings through a flood of fake businesses. When the listing of one auto junkyard fell from the first to the second page of Google Maps results, the owner's income fell by half and pushed him to the edge of closing shop entirely.[1487]

Legitimate businesses hurt by fake listings say that contacting Google to report the situation generally fails to resolve the problem. In practice, the only way legitimate businesses can shield themselves from fake listings is to buy ads from Google. Ad prices for categories that are most susceptible to ad fraud have increased more than 50% over the last two years.[1488]

The Subcommittee asked Google about this practice on several occasions. At the Subcommittee's July 16, 2019 hearing, Congresswoman Lucy McBath (D-GA) asked Adam Cohen, Google's director of economic policy, what steps Google was taking to identify and remove fraudulent listings on Google Maps.[1489] She added, "Is it a lack of competition in online search that allows Google to be so complacent by addressing this problem head on?"[1490] Mr. Cohen responded that he was "not familiar" with the relevant facts.[1491] In response to a follow-up letter sent by Chairman Cicilline, Google wrote that it has "no evidence" that the number of fake listings on Google Maps is around 10

million.[1492] Google stated that, as of July 2019, it had taken down more than 3 million fake business profiles and that it has "implemented strict policies and created tools that enable people to flag false content."[1493]

Both digital advertisement experts and individuals engaging in fraudulent activity believe that Google has turned a blind eye to the problem. According to the *Wall Street Journal*, one ad specialist who was invited by Google to help root out the problem left after concluding that Google "has obviously chosen not to solve the problem."[1494] A business owner who helps facilitate the fake listings says his activity leaves a "huge footprint" and yet Google is "just letting it happen." He added, "I know Google knows."[1495]

7. Cloud

Google Cloud Platform (GCP) is Google's suite of public cloud computing services that first launched in 2008.[1496] Today, Google Cloud is Alphabet's fastest-growing line of business, with revenues in Q1 2020 hitting $2.78 billion, up 52% from $1.83 billion in Q1 2019.[1497] Documents provided to the Subcommittee make clear that the cloud market is a priority for the company.[1498] GCP is the third largest provider of IaaS services in the United States and has a year-over-year growth rate twice that of Amazon Web Services—the current market leader.[1499] Today, GCP boasts long term contracts with data-intensive companies such as SNAP, Spotify and TikTok.[1500]

Subcommittee staff reviewed internal documents that outline Google's plans to invest significantly in acquisitions.[1501] To date, these acquisitions include Orbitera,[1502] Cask Data, Velostrata, and Elastifile, among others.[1503] Most recently, Google purchased Looker for $2.6 billion to "add a new analytics tool for Google Cloud's customers."[1504] In some instances, Google acquired firms that were multi-cloud solutions but, after acquisition, Google made them compatible only with Google's cloud infrastructure, at times integrating them into first-party PaaS and SaaS offerings only available through the Google Cloud Portal.[1505]

According to interviews with market participants and Google's internal documents, Google employs two strategies that raise concerns about potential anticompetitive conduct. First, Google appears to leverage its dominant business lines, including popular APIs such as Google Search and Maps, along with machine learning services, to attract customers to its platform through discounts and free tier services.[1506] For example, according to internal strategy documents, in 2018, Google "launched a program with the Play team to provide GCP credits to game developers based on their Play Store spend, to increase focus on Play and incentivize migration to GCP."[1507] By harnessing Google's advantages in existing markets, GCP is undermining competition on the merits.

Second, Google's documents suggest the company is considering bundling its popular machine learning service with other services that Google is seeking to promote. One recent Google cloud pricing strategy document explains, "the question that we need to think about is whether we use our entry point with Big Query to get a customer to use all the services such as Data Proc, Data Flow, as a suite and give them a price break on the Analytics Suite because it will be much harder for them to migrate away from us if they use all the other services."[1508] The document goes on to describe potential

discounts and ultimately a plan to have "a pricing model that makes it advantageous for customers to put 80% of their workload on GCP."[1509] As described elsewhere in this Report, absent interventions, the barriers to entry and network effects in this market mean there is a high potential for single-homing and an overall concentrated market.[1510] As Google grows in this space, regulators and enforcers should be watchful for potential anticompetitive conduct.

C. Amazon

1. Overview

Amazon.com, Inc. was founded in 1994 as an online bookseller.[1511] Today, it is one of the largest companies in the world. Based in Seattle, Amazon is estimated to be the second-largest private employer in the United States, with over 500,000 employees.[1512] The company operates across a wide range of direct-to-consumer and business-to-business markets, including e-commerce, consumer electronics, television and film production, groceries, cloud services, book publishing, and logistics. Amazon went public in 1997 but did not post its first full-year profit until 2003.[1513] This is partly because Amazon's business strategy has generally focused on long-term growth over short-term profits.[1514] Amazon is currently one of the most valuable companies in the world, and its CEO, Jeff Bezos, is reported to be the wealthiest person in the world.[1515]

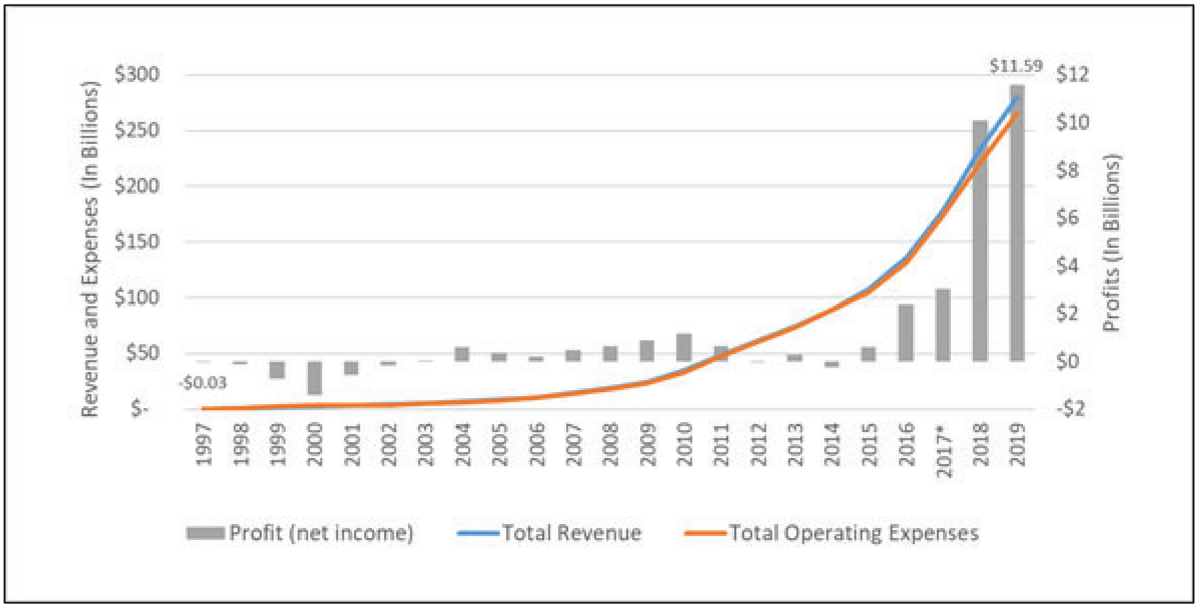
Amazon's Annual Revenue, Operating Expenses, and Profits[1516]



Amazon reports financial information for three business segments: North America, International, and Amazon Web Services (AWS), Amazon's cloud services business.[1517] Despite the fact that Amazon is already so large that it dominates several important industries, it continues to report strong and steady growth—as well as increasing profits. For 2019, Amazon reported total revenue of about $280 billion, up 20% from the previous year, and a net income of over $11 billion.[1518] AWS's revenue increased by 37% in 2019 to $35 billion.[1519] Retail operations continue to be the platform's largest source of revenue, but AWS is a key source of its overall profits.[1520] In 2019, Amazon's cloud business contributed over 60% of Amazon's total operating income, despite accounting for only 12.5% of its total revenue.[1521]

Sales on Amazon.com fall into one of two categories. First-party sales are those where Amazon retails its own private-label products or sources products wholesale from a vendor or manufacturer. Third-party sales, in contrast, refer to sales by independent merchants who sell through the Amazon

[1521] Amazon.com, Inc., Annual Report (Form 10-K) 24–25 (Jan. 31, 2020), http://d18rn0p25nwr6d.cloudfront.net/CIK-0001018724/4d39f579-19d8-4119-b087-ee618abf82d6.pdf.

Marketplace. When a consumer visits Amazon.com, Amazon's private-label products, such as AmazonBasics or its Kindle E-Readers, are listed for sale alongside independent merchants' offers.

One of the unique features of Amazon's e-commerce site is its fast and free shipping on an extremely broad selection of products. Amazon Prime Members can choose from over 100 million items that are available for free two-day delivery in the continental United States. Walmart, by contrast, has only single-digit millions of products eligible for free two-day shipping.[1522] In response to questions from the Subcommittee, Amazon represented that it offers approximately 158,000 private-label products across 45 in-house brands, not including some additional private-label products sold through Amazon Fresh.[1523] Amazon also hosts 2.3 million active third-party sellers from around the world,[1524] about 45 times more than the 52,000 third-party sellers that Walmart hosts on its marketplace.[1525] A recent survey estimated that about 37% of Amazon's third-party sellers, representing over 850,000 sellers, rely on Amazon as their sole source of income.[1526]

Amazon does not limit the number of sellers that can offer the same product for sale on its platform. Because of this, the same product may be sold by multiple sellers, as well as by Amazon. Each time a consumer clicks on a product, Amazon chooses a single seller from all the vendors offering that product to display as the featured offer in the "Buy Box."[1527] In its response to questions from the Subcommittee, Amazon stated that the featured merchant algorithm, also commonly referred to as the Buy Box algorithm, is designed to predict the offer that consumers would choose after comparing all the available offers in detail.[1528]

The *Amazon Buy Box Playbook*, a well-known guide for sellers, explains this in lay terms:

> When a shopper lands on a product detail page, Amazon chooses one seller whose details appear in the Buy Box—the white box on the right hand side of the page. When a customer clicks on the "Add to Cart" button, the sale goes to the seller in this box.[1529]

Industry experts estimate that about 80% of Amazon sales go through the Buy Box, and the percentage is even higher for mobile purchases.[1530] In response to a question from the Subcommittee, Amazon provided only high-level information about how it chooses which offer will win the Buy Box, stating that the algorithm considers criteria such as price, delivery speed and cost, Prime eligibility, and seller performance.[1531] Despite the importance of winning the Buy Box to sellers on its platform, only Amazon knows exactly how its featured merchant algorithm works.

As Amazon's e-commerce business has grown, it has also developed a significant logistics business providing fulfillment and delivery services to third-party sellers through its Fulfillment by Amazon (FBA) program. Nearly 85% of the top 10,000 Amazon Marketplace sellers reportedly rely on this program to fulfill and deliver their orders.[1532] Third-party sellers that use FBA keep their inventory in Amazon's fulfillment centers.[1533] After a consumer places an order online, Amazon does the picking, packing, and shipping, and provides customer service to complete the order.[1534] The figure below explains the different types of sellers on Amazon.com and the various modes of delivery and fulfillment they use.

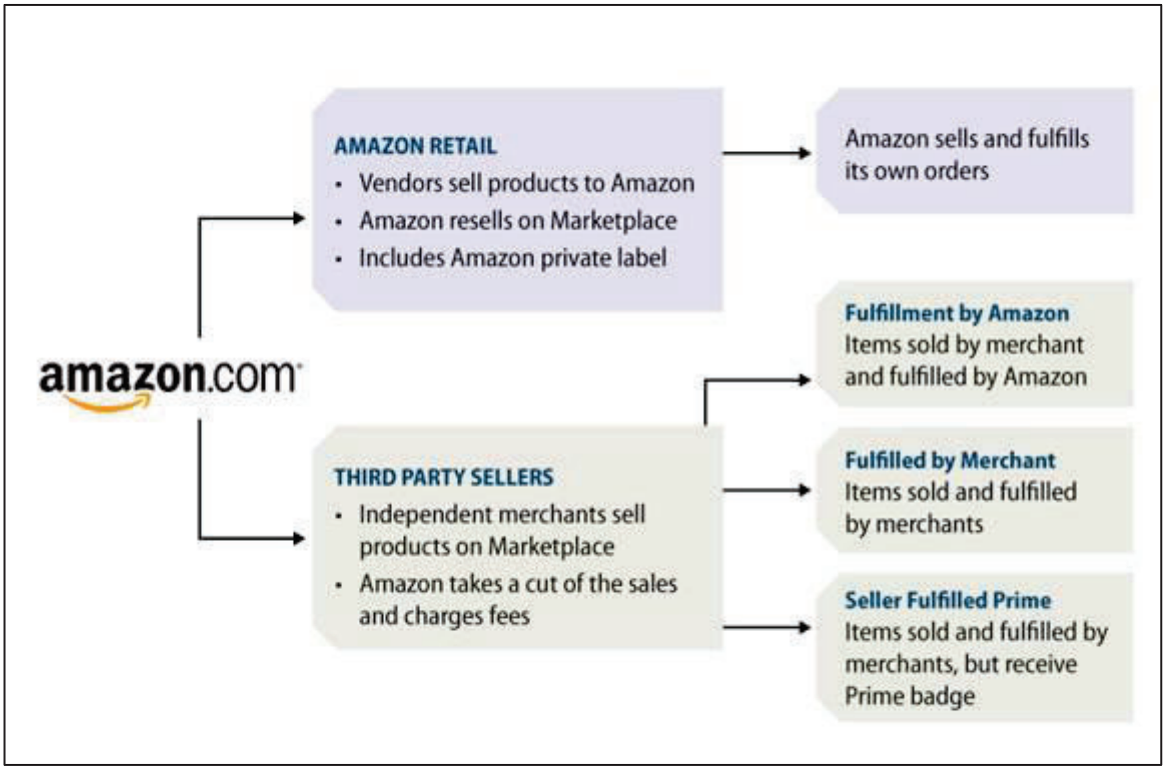
Types of Sellers on Amazon and Shipping Options[1535]



Amazon generates a significant amount of revenue from the fees that it charges third-party sellers. According to a recent SEC filing, net sales for services provided to third-party sellers increased from $23 billion in the first six months of 2019 to $32 billion over the same period in 2020—an increase of 39%.[1536] For the ability to sell a product on the platform, a seller might pay the company a monthly subscription fee, a high-volume listing fee, a referral fee on each item sold, and a closing fee on each item sold.[1537] Amazon charges additional fees for fulfillment and delivery services, as well as for advertising.[1538]

AWS, the company's cloud services business, offers digital infrastructure services to businesses that require increased computing infrastructure, such as increased capacity for servers to host or store data. Amazon is the dominant provider of infrastructure as a service. AWS accounts for close to half of all global spending on cloud infrastructure services, and the business has three times

the market share of Microsoft, its closest competitor.[1539] Cloud services are an essential and increasingly expensive line item for many companies. Given AWS's role as a dominant cloud provider, some of Amazon's competitors in other business lines often end up dependent on the platform. For example, Netflix, a competitor of Amazon Prime Video, paid AWS $500 million in 2018 to store its streaming video library.[1540]

While the pandemic has harmed many businesses, Amazon has experienced a surge in sales.[1541] The company's operating profit of $5.8 billion during the second quarter of 2020 significantly outperformed the -$1.5 billion to +$1.5 billion projection that Amazon had issued to investors.[1542] One analyst described the magnitude of Amazon's recent sales growth outperformance as a "paradigm-shifting update."[1543] In October 2020, Amazon's stock price was about $3,000, giving it a market valuation of about $1.5 trillion[1544]—greater than that of Walmart, Target, Salesforce, IBM, eBay, and Etsy combined.[1545] The company is consistently one of the highest-priced stocks on Wall Street,[1546] which is a clear indication investors expect Amazon to maintain and expand its market power.

The Subcommittee initiated its investigation of Amazon's market power and its role as a gatekeeper for digital markets in June 2019. Before and concurrent with the Subcommittee's investigation, many international and U.S. enforcement authorities also opened antitrust investigations

into Amazon's business practices. Some of these investigations have led to Amazon making policy changes.[1547] The European Commission began its in-depth antitrust investigation of Amazon on July 17, 2019.[1548] According to Executive Vice President Margrethe Vestager, the European Commission's investigation "focuses on the use by Amazon of accumulated, competitively sensitive information about marketplace sellers, their products and transactions on the Amazon marketplace, which may inform Amazon's retail business decisions."[1549] In the United States, the Federal Trade Commission (FTC) is investigating Amazon's past acquisition activity.[1550] The FTC is also reportedly investigating Amazon's treatment of third-party sellers and its cloud services business.[1551] Additionally, Amazon reportedly faces antitrust scrutiny by state attorneys general offices in California, Washington, and New York.[1552]

During the course of the investigation, Amazon displayed a lack of candor to the Subcommittee in response to questions about its business practices. As Chairman Nadler, Subcommittee Chairman Cicilline, and Ranking Member Sensenbrenner, along with other members of the Committee, wrote to Mr. Bezos in a bipartisan letter in May of this year, the Subcommittee was troubled that some of the "statements Amazon made to the Committee about the company's business practices appear to be

misleading, and possibly criminally false or perjurious."[1553] In light of this concern, Subcommittee staff views Amazon's other claims and representations with a degree of skepticism in instances where they conflict with credible sources, such as investigative reporting, interviews with market participants, or other evidence uncovered by Subcommittee staff during the investigation.

2. Amazon.com

a. Market Power

Amazon has significant and durable market power in the U.S. online retail market.[1554] The company's actual share of U.S. e-commerce is unknown outside of Amazon because it does not report the gross merchandise volume of third-party sales made on its marketplace. A frequently cited analysis by market research company eMarketer estimates that Amazon's share in this market is 38.7%.[1555] eMarketer's estimate, however, is likely understated because its definition of e-commerce is overly broad. For example, under eMarketer's approach to e-commerce, the Auto and Parts category includes online sales of cars.[1556] In contrast, marketing analytics company Jumpshot estimates that Amazon captures an average of 74% of digital transactions across a wide range of product categories.[1557] The Jumpshot analysis may overstate Amazon's share because it calculates market share as a percentage of transactions made on well-known market participants' websites, like Amazon, Walmart, and Target, but excludes small, online retailers.[1558] Based on the information Subcommittee staff gathered during its investigation, estimates that place Amazon's share of U.S. e-commerce at about 50% or higher are more credible than lower estimates of 30-40%.[1559]

[1553] Bipartisan Letter from the Chairman, Ranking Member, and Members of H. Comm. on the Judiciary to Jeff Bezos, CEO, Amazon.com, Inc. (May 1, 2020), https://judiciary.house.gov/uploadedfiles/2020-05-01_letter_to_amazon_ceo_bezos.pdf.

AMAZON, WHOLE PAYCHECK TRACKER: BATTLE FOR THE DIGITAL FIRST CONSUMER 6 (2020), https://securecdn.pymnts.com/wp-content/uploads/2020/09/Amazon-Walmart-Whole-Paycheck-092020.pdf (estimating Amazon's market share at 51.2% in Q1 2020 and 44.4% in Q2 2020, but noting U.S. e-commerce

In a number of key product categories, ranging from household essentials to sports, fitness and outdoors, Amazon is reported to account for well over 50% of online sales.[1560] The platform also has significant market power over the entire book industry, including sales, distribution, and publishing. In the U.S. market, Amazon accounts for over half of all print book sales and over 80% of e-book sales.[1561]

Amazon is the dominant online marketplace. It reportedly controls about 65% to 70% of all U.S. online marketplace sales.[1562] The platform's market power is at its height in its dealings with third-party sellers, as well as many of its suppliers, which Amazon refers to as vendors. Increasingly, Amazon is also gaining market power in certain business-to-business (B2B) online markets through Amazon Business, its B2B marketplace.[1563]

In response to the Committee's requests for information, Amazon claims that "estimates of total retail share are the most appropriate and relevant method of estimating" Amazon's market share.[1564] This approach is inconsistent with evidence gathered by Subcommittee staff, conventional antitrust analysis of relevant product markets, and common sense. In a recent investigation, for example, the FTC concluded that a "relevant market may be divided by channel of sale, resulting in separate markets for brick-and-mortar sales and online sales."[1565] Illustrating the extent of Amazon's overly broad approach to identifying the relevant market and its top competitors, in response to the

Committee's request for "A list of the Company's top ten competitors," Amazon identified 1,700 companies, including Eero (a company Amazon owns), a discount surgical supply distributor, and a beef jerky company.[1566]

Amazon also included single-category companies in response to the Committee's request for a list of Amazon's top ten competitors. Yet documents produced by Amazon suggest that even in its early days it did not view such retailers as direct competitors. For instance, a recap of an Amazon marketing presentation identified one of its key points as: "No direct competitors, closest competitors would be what you refer to as category driven i.e. Best Buy, Barnes and Noble...etc."[1567]

Regardless of the precise boundaries of e-commerce or online marketplaces, the sum of evidence that Subcommittee staff examined demonstrates that Amazon functions as a gatekeeper for e-commerce. Amazon is the most-visited website in the world for e-commerce and shopping.[1568] In a submission to the Committee, an e-commerce market participant said that "many of the 64% of American households that have Prime memberships are effectively locked into Amazon for their online shopping."[1569] Meanwhile, recent market analysis suggests that over 60% of all online product searches in the U.S. begin on Amazon.com.[1570]

At the Subcommittee's hearing on innovation and entrepreneurship, Stacy Mitchell, the Co-Director of the Institute for Local Self-Reliance, described one independent retailer's attempt to survive in e-commerce independent of Amazon:

> As its customers moved online, so too did the company. Gazelle Sports built a robust e-commerce site. With scores of enthusiastic reviews on Google and Yelp, the site came right up in online searches, yielding a brisk stream of customers and sales.
>
> But, in 2014, sales began to decline. The problem was that many people in Michigan and across the country were no longer starting their online shopping on a search engine, where they might find Gazelle Sports. Instead, they were going straight to Amazon. By

> 2016, the share of online shoppers bypassing search engines and beginning their product search on Amazon had grown to 55 percent. With sales flagging and staff reductions underway, the owner of Gazelle Sports . . . made what seemed like a necessary decision: Gazelle Sports would join Amazon Marketplace, becoming a third-party seller on the digital giant's platform. "If the customer is on Amazon, as a small business you have to say, 'That is where I have to go,'" he explained. "Otherwise, we are going to close our doors."[1571]

Interviews with sellers, as well as documents that Subcommittee staff reviewed, make clear that Amazon has monopoly power over most third-party sellers and many of its suppliers.[1572] Numerous sellers told Subcommittee staff in interviews that they cannot turn to alternative marketplaces, regardless of how much Amazon may increase their costs of doing business or how badly they are treated. David Barnett, the CEO and Founder of PopSockets, a former third-party seller and current Amazon supplier, testified about Amazon's coercive tactics at one of the Subcommittee's hearings:

> I suspect that Amazon is accustomed to behaving this way because most brands cannot afford to leave Amazon. They evidently have no choice but to endure tactics that would be rejected out of hand in any ordinary relationship whereby the two parties enter into the relationship by preference rather than necessity.[1573]

Sellers feel forced to be on Amazon because that is where the buyers are.[1574] At the Subcommittee's sixth hearing, Representative Lucy McBath (D-GA) noted that the evidence the Subcommittee collected is at odds with how Amazon describes its relationship with third-party sellers. She asked Mr. Bezos:

> [Y]ou referred to third party sellers today as "Amazon's partners" and that your success depends on their success. But, over the past year, we've heard a completely different story. As part of this investigation, we've interviewed many small businesses, and they use the words like "bullying," "fear," and "panic" to describe their relationship with Amazon. . . . . You said that sellers have many other attractive options to reach customers, but that's not at all what we found in our investigation . . . . If Amazon

[1574] Submission from Source 11, to H. Comm. on the Judiciary, 5 (Oct. 14, 2019) (on file with Comm.).

didn't have monopoly power over these sellers, do you think they would choose to stay in a relationship that is characterized by bullying, fear, and panic?"[1575]

Mr. Bezos responded that "there are a lot of options" for sellers, and that "[t]here are more and more every day."[1576] This claim is inconsistent with the Subcommittee's investigative record. In a submission to the Committee, the Online Merchants Guild, a trade association for small and medium-sized online sellers, said that its members who try to diversify sales across multiple platforms often report that they are unable to generate many sales outside of Amazon.[1577]

An important limit on a seller's ability to switch from selling on Amazon to selling on its own site or a competing platform is that Amazon generally forbids sellers from contacting their customers.[1578] The packaging and even the order confirmation email for third-party sales feature the Amazon brand prominently and do not reference the seller. A typical Amazon customer is unaware of the source of the sale.[1579] According to the Online Merchants Guild, "Many Amazon sellers use websites such as Shopify to try and establish their own eCommerce presence, but without the ability to market to their supposed core customer base, their Amazon customers, it's pretty futile."[1580]

Subcommittee staff heard from several market participants that Amazon also has significant market power over suppliers. For example, third-party sellers told Subcommittee staff that Amazon frequently ignores manufacturer policies that bind sellers.[1581] For example, brand manufacturers may establish minimum advertised pricing guidelines (MAP) to prevent online retailers from freeriding off brick-and-mortar stores' investments in product display or expertise—such as how to fit a running shoe. Amazon's leverage over suppliers gives it the ability to "break" minimum advertised pricing

---

1575 CEO Hearing Transcript at 88–89 (question of Rep. Lucy McBath (D-GA), Member, Subcomm. On Antitrust, Commercial and Admin. Law of the H. Comm. on the Judiciary).

1576 *Id.* at 91 (statement of Jeff Bezos, CEO, Amazon.com, Inc.).

1577 Submission from Online Merchants Guild, to H. Comm. on the Judiciary, 4 (Oct. 23, 2019) (on file with Comm.) ("Members who sell across multiple platforms often report the amount of revenue generated outside of Amazon including their own eCommerce site, is insignificant, with over 90% of their sales being generated on the platform."); *see also* Submission from Top Shelf Brands, to H. Comm. on the Judiciary, 60–61 (Oct. 26, 2019) (explaining that it has "no viable alternatives" to Amazon, where 98% of its transactions have taken place on Amazon's platform, eBay accounts for 1% of its income, and Walmart accounts for less than 1%).

1578 *Selling Polices and Seller Code of Conduct*, AMAZON SELLER CENTRAL, https://sellercentral.amazon.com/gp/help/external/G1801?language=en_US&ref=efph_G1801_cont_200386250 (last visited Sept. 28, 2020); *see also* Submission from Source 100, to H. Comm. on the Judiciary (Sept. 26, 2020) (raising concerns that Amazon permits itself to contact customers about negative reviews for Amazon branded products, while third-party sellers are largely barred from customer engagement).

1579 Submission from Online Merchants Guild, to H. Comm. on the Judiciary, 4 (Oct. 23, 2019) (on file with Comm.); *see also* Submission from Source 11, to H. Comm. on the Judiciary, 3 (Oct. 14, 2019) (on file with Comm.) (explaining that "[w]henever an order is shipped through [Fulfillment by Amazon], even if the purchase is made through another marketplace, it is likely to arrive in an Amazon-branded box, creating confusion" for customers).

1581 *See, e.g.*, Phone Interview with Source 84 (Mar. 4, 2020).

rules and undercut competing sellers on price. In contrast, third-party sellers must abide by the rules. As a former third-party seller explained, "Given Amazon's immense clout, we believe that suppliers have no realistic threat to stop selling on Amazon in response to Amazon 'breaking' MAP."[1582] Amazon's internal documents suggest that it does not fear any consequences for failing to comply with most vendor policies.[1583]

Another way that Amazon leverages its market power is to force certain brand manufacturers that would prefer to be third-party sellers into being wholesalers. A discussion among Amazon executives suggests that certain brands may only be allowed to have a wholesale relationship with Amazon even if the brand would prefer to be a third-party seller. In 2016, Sebastian Gunningham, then senior vice president of Amazon Marketplace, commented on a list of proposed seller tenets, "I would add that there are x,000 suppliers around the world that do not get this choice... I am talking about the apple, nikes and p&g, etc... We don't want to open that door, relationship has to be reseller."[1584] Consistent with this stance, Popsockets CEO and Founder David Barnett testified that Amazon attempted to force him into maintaining a wholesale relationship with Amazon Retail despite his preference to be a third-party seller or make sales on the marketplace through an authorized distributor.[1585] A former Amazon employee confirmed that it was not uncommon for Amazon to use its brand standards policy to shut down a brand's third-party seller account and force brands into an exclusive wholesaler relationship.[1586]

Amazon also enjoys significant market power over online consumers. Amazon uses Prime and its other membership programs to lock consumers into the Amazon ecosystem. According to an internal analysis, Amazon was willing to pay a credit card company a significant sum in 2013 for signing up new Prime members under the assumption that each new member would contribute $527 to Amazon's gross merchandise sales and $46 of gross profit.[1587] Amazon estimated that the deal had a five-year net present value of $17 million, assuming that it delivered 100,000 paid Prime members.[1588]

[1582] Submission from Source 48, to H. Comm. on the Judiciary, 8 (Nov. 8, 2019) (on file with Comm.).

[1583] *See, e.g.*, Production of Amazon, to H. Comm. on the Judiciary, AMAZON-HJC-00151722 (Feb. 9, 2009) (on file with Comm.) ("[P]lease audit that we are price matching . . . any diapers.com pricing. If this puts us in the soup with P&G on their pampers map price, so be it."); AMAZON-HJC-00206714 (Mar. 8, 2018) ("Why did Walmart break MAP and we didn't?").

[1584] Production of Amazon, to H. Comm. on the Judiciary, AMAZON-HJC-00190108 (June 6, 2016) (on file with Comm.).

[1588] *Id.*

Once Prime members pay the upfront annual membership fee, they are likely to concentrate their online purchases with Amazon.[1589] According to a recent survey, Prime members spend an average of $1,400 annually on Amazon, versus $600 for non-members.[1590] As one market participant observed, "Prime members will continue to use Amazon and not switch to competing platforms, despite higher prices and lower-quality items on Amazon compared to other marketplaces, and despite recent increases in the price of a Prime membership."[1591]

Other retailers are unable to match Amazon on its ability to provide free and fast delivery for such a large volume and inventory of products. Even Walmart, with its extensive national distribution network, does not come close to matching Amazon on this measure.[1592] Amazon currently offers Prime members free, next-day delivery on over 10 million items anywhere in the continental United States.[1593] Walmart, by contrast, has only about 200,000 products eligible for two-day shipping in select markets.[1594]

Amazon's market power is durable and unlikely to erode in the foreseeable future. There are several factors that make successful entry or expansion by a challenger to Amazon unlikely. Barriers to entry include: (1) network effects, which make it difficult for another marketplace to achieve a comparable number of buyers and sellers; (2) switching costs associated with consumers shopping outside of the Amazon ecosystem; and (3) the steep costs of building a logistics network comparable in size and scope to Amazon's massive international footprint in fulfillment and delivery. Amazon's internal documents recognize that entry into online commerce "require[s] significant incremental investments in brand development, inventory, and marketing/customer acquisition."[1595] Further,

[1595] Production of Amazon, to H. Comm. on the Judiciary, AMAZON-HJC-00154659 (Nov. 23, 2010) (on file with Comm.).

Amazon expanded its market power by avoiding taxes, extracting state subsidies, and engaging in anticompetitive conduct—tactics that have given the company an unfair advantage over actual and potential competitors.

As the COVID-19 pandemic pushes more American shoppers online, Amazon's market power has grown. Evidence shows that Amazon is willing to use its increased market power in e-commerce during this crisis to exert pressure on suppliers and favor its own first-party products over those sold by third-party sellers. Amazon initially responded to the sudden surge in sales by refusing to accept or deliver non-essential supplies from its third-party sellers—a stance that would seem reasonable except that Amazon continued to ship its own non-essential products while restricting third-party sellers' ability to use alternative distribution channels to continue selling through Prime.[1596] As for suppliers, Subcommittee staff heard concerns that the platform used its power as a large buyer to pressure suppliers into prioritizing Amazon over other retail customers such as independent grocers.[1597] Meanwhile, numerous reports suggest that Amazon is in talks to convert real estate in vacated malls into additional Amazon distribution centers, further highlighting how it will continue to amass further scale even as its brick-and-mortar counterparts crater.[1598]

b. Merger Activity

Amazon's acquisition strategy has primarily focused on purchasing its competitors and companies that operate in adjacent markets, providing access to additional valuable customer data. This strategy has effectively protected and expanded Amazon's market power in e-commerce and helped Amazon extend that power to other markets.

Over the past two decades, Amazon has acquired at least 100 companies.[1599] It has been particularly aggressive over the past few years, making deals that are bigger and more ambitious

relative to its historical approach.[1600] In 2017, the company made its largest acquisition to date by purchasing Whole Foods for $13.7 billion.[1601] Amazon's other large purchases include Ring, which it bought for $1.2 billion in 2018; PillPack, which it bought for $1 billion in 2018; and Zappos, which it bought for $1.2 billion in 2009.[1602] Over the years, Amazon has acquired an assortment of highly recognizable companies, including IMDB.com, which it bought in 1998; Audible, which it bought in 2008; Goodreads, which it bought in 2013; and Twitch, which it bought in 2014.[1603]

Amazon's acquisition strategy has led to fewer choices for consumers in terms of differentiated online retail channels, as well as reduced competitive pressure in terms of price and quality. Additionally, Amazon's expansion into a diverse array of business lines—from brick-and-mortar supermarkets to home security—has reinforced its significant stockpile of consumer data. With more data about online and offline consumer behavior, Amazon's acquisitions set in motion a self-reinforcing cycle, creating an ever-widening gap between the platform and its competitors. As one former Amazon employee told Subcommittee staff, "Amazon is first and foremost a data company, they just happen to use it to sell stuff."[1604]

Over its history, Amazon has acquired a number of its rivals.[1605] A decade ago, Amazon acquired two of its direct competitors: Zappos and Quidsi.[1606] Documents reviewed by Subcommittee staff show that Amazon viewed both online retailers as competitive threats prior to acquiring them.

Amazon's 2009 acquisition of Zappos, an online shoe-retailer, marked the company's first $1 billion-plus purchase.[1607] Acquiring Zappos provided Amazon with two important advantages. First, it

enabled Amazon to add significant selection to its category of shoes and other fashion-related items at a time when expanding its selection was critical to the company's success.[1608] The added selection included access to "hold-out" brands, which had previously refused to sell on Amazon.com or Amazon's other online retail store Endless.com.[1609] Second, Zappos' unique approach to customer service, marked by "a deeply felt connection with customers," added an emotional and psychological element to Amazon's relationship with consumers.[1610] An Amazon internal planning document from 2008 referred to Zappos as one of Endless's "primary competitors," and notes that "Zappos offers the largest selection of brands and styles and carries all of our top holdouts including Nike, Merrell, Keen, Cole Haan and Michael Kors."[1611]

About a year later, Amazon acquired Quidsi, the parent company of Diapers.com and Soap.com, for about $540 million.[1612] Prior to buying it, Amazon identified Diapers.com as its "largest and fastest growing competitor in the on-line diaper and baby care space,"[1613] and its "#1 short term competitor."[1614] Amazon's internal documents said that Diapers.com "keep[s] the pressure on pricing on us" and provided extremely high customer service levels, which—prior to the merger—had forced Amazon to up its game.[1615] Amazon executives took swift and predatory action in response to this competitive threat. As Representative Mary Gay Scanlon (D-PA) summarized at the Subcommittee's sixth hearing, Amazon's internal documents "show that Amazon employees began strategizing about ways to weaken this company, and, in 2010, Amazon hatched a plot to go after Diapers.com and take it out."[1616] Specifically, Amazon's documents show that the firm entered into an aggressive price war, in which Amazon was willing to bleed over $200 million in losses on diapers in one month.[1617] Addressing Mr. Bezos, Representative Scanlon added, "Your own documents make clear that the price

war against Diapers.com worked, and within a few months it was struggling, and so then Amazon bought it."[1618]

In 2017, Amazon shut down Diapers.com, citing profitability issues, though some industry experts questioned the legitimacy of this rationale.[1619] In shutting down the company, Amazon eliminated a differentiated online retailer that consumers loved[1620]—reducing the number of online options for consumers in the diaper and baby care markets. Further, it eliminated a potential competitor in other verticals such as household goods, toys, and pets.[1621]

More recently, Amazon acquired Whole Foods, a strategic move to acquire both a competitor,[1622] and a new source of customer data.[1623] Amazon purchased Whole Foods at around $13.7 billion, more than 10 times the cost of its second-most expensive acquisition.[1624] In addition to bolstering its position in the grocery market, Amazon's purchase of Whole Foods expanded its touchpoints with Prime members and gave it access to a unique set of customer information.[1625] Specifically, the deal enabled Amazon to monitor and compile data on how the same person shops

[1625] Production of Amazon, to H. Comm. on the Judiciary, AMAZON-HJC-00172090 (June 22, 2017) (on file with Comm.) ("[A] survey said about 45% of WFM customers are Prime; and about 20% of Prime members shop at [Whole Foods Market]."); Production of Amazon, to H. Comm. on the Judiciary, AMAZON-HJC-00173652 (June 23, 2017) (on file with Comm.) ("Based on our survey results, we estimate that approximately 46% of Prime members have shopped at a [Whole Foods] store in the last four weeks.").

both online and in person, data that is particularly useful for targeted advertising and promotional campaigns.[1626]

While the deal was under review by the FTC, then-Ranking Member Cicilline raised concerns that "the proposed acquisition w[ould] result in additional consolidation in the retail sector, erode American jobs through increased automation, and threaten local communities through diminished economic opportunity for hardworking Americans."[1627] Amazon's acquisition of Whole Foods has added to the platform's market power in retail by increasing its buyer power over suppliers,[1628] adding to the platform's capabilities in online grocery, and expanding the company's brick-and-mortar retail footprint. In addition, it appears that concerns about diminished economic opportunities may have been well-founded as Amazon reportedly plans to implement cashier-less technology across all of its Whole Foods stores.[1629]

In recent years, Amazon has also made several significant acquisitions of home security companies, further expanding its reach and visibility into Americans' homes. An Amazon executive described the company's in-home strategy by noting, "Two senses matter – eyes and ears."[1630] In 2017, Amazon paid $90 million to acquire Blink, a home security camera company whose technology and energy-efficient chips could be used by Amazon in its Echo speakers and other products.[1631] In 2018, Amazon spent $1.2 billion to acquire Ring, a home-security system spanning cameras, doorbells, and floodlights.[1632] Ring's "eyes and ears" add significant value to Amazon's smart home, allowing customers to virtually interact with Amazon delivery personnel and instruct them on where to drop off Amazon packages.[1633] Amazon's significant investments in the Internet of Things ecosystem and its strategy, centered on Amazon's voice assistant, Alexa, are discussed in other parts of this Report.

1633 *Id.*

Other notable acquisitions include Kiva Systems in 2012, which provided Amazon with a robotics company that accelerated its ability to streamline picking, packing, and shipping e-commerce products;[1634] and PillPack in 2018, which equips Amazon with an online pharmacy and marks its entry into the pharmaceutical market.[1635]

Amazon's acquisition of Kiva gave it power over an important input for competitors. When Amazon bought the robotics company, Kiva was supplying technology to a large number of retailers, including Gap, Staples, and Walgreens.[1636] Many of these customers had invested a sunk cost of $4 million to $6 million per warehouse in order to make use of Kiva's technologies.[1637] Kiva had promised to keep shipping its technology to non-Amazon customers—regardless of whether they competed with Amazon—but in 2015, Amazon rebranded the company as Amazon Robotics and announced it would stop servicing other firms.[1638] Amazon stated that retailers seeking to use Kiva's robots would need to use Amazon Services to fulfill orders with Amazon's technology in Amazon's warehouses.[1639]

Documents Subcommittee staff reviewed relating to the PillPack deal, meanwhile, give insight into how Amazon views some acquisitions as opportunities to collect additional customer data and to cross-sell across its different business lines. One Amazon executive summarized a potential upside of the PillPack deal, asking, "Is there a cross-selling opportunity with amazon.com based on known maladies from prescriptions? Or is this prohibited by privacy law? My understanding is there is a number of different ways we could cross-sell customers in both directions (Rx<>non-Rx)."[1640] Though it is unclear whether and the extent to which Amazon implemented this strategy, the exchange reveals how Amazon assesses potential acquisitions and the cross-business opportunities they create, suggesting that the firm views its vast operations in a highly integrated manner.

[1640] Production of Amazon, to H. Comm. on the Judiciary, AMAZON-HJC-00172665 (May 23, 2018) (on file with Comm.).

The FTC investigated several of these transactions, including Amazon's acquisition of Quidsi, the parent company of Diapers.com,[1641] and Whole Foods.[1642] The agency declined, however, to challenge any of them as a violation of antitrust law despite: (1) strong evidence, in some cases, of direct head-to-head competition on price and quality between the merging firms; and (2) evidence that many of these mergers would enable Amazon to expand or entrench its market power, particularly in e-commerce. For most, if not all, of the acquisitions discussed in this Report, the FTC had advance notice of the deals but did not attempt to block any of them.

In addition to eliminating competitive threats, Amazon's acquisition strategy has expanded and protected the company's dominance. The company's significant expansion into new markets, paired with Amazon's wealth of data from its retail business, has fueled the platform's increasing market power. Amazon Associate General Counsel Nate Sutton testified at the Subcommittee's hearing last July that "Amazon is proud to be a company of builders and we have built our company from within, not through acquisitions."[1643] But the evidence examined during the investigation demonstrates that Amazon's acquisitions—including acquisitions of its direct competitors—have been key to Amazon's attainment, maintenance, and expansion of market power.

c. Conduct

i. Treatment of Third-Party Sellers

1) Bullying

While Amazon has referred to third-party sellers on its Marketplace as "partners," and "customers,"[1644] numerous small and medium-sized businesses told the Subcommittee that Amazon routinely bullies and mistreats them. The Online Merchants Guild, a trade association representing the interests of sellers engaged in online commerce, stated that they "have seen Amazon use their position of strength to take advantage of sellers."[1645]

Underlying Amazon's public-facing rhetoric is the reality that it views many of the sellers on its platform as competitors. In its internal documents, Amazon refers to third-party sellers as "internal

competitors."[1646] At the Subcommittee's sixth hearing, Subcommittee Chairman Cicilline asked Mr. Jeff Bezos about Amazon's apparent doublespeak.[1647] In response, Mr. Bezos conceded, "[I]t wouldn't surprise me. In some ways, we are competing."[1648]

Over the course of the investigation, the Subcommittee heard from numerous sellers who described abusive tactics or mistreatment by Amazon in a variety of circumstances. For example, at the Subcommittee's fifth hearing, CEO and Founder of PopSockets David Barnett testified about Amazon's bullying tactics, which he said were enabled by "the asymmetry in power between Amazon and its partners."[1649] He stated that after the two companies decided on a minimum price at which Amazon would sell PopSockets, Amazon sold the products for a lower price and then demanded that PopSockets pay for the lost margin.[1650] As a result, PopSockets decided to end its relationship with Amazon Retail.[1651] When PopSockets communicated this intent to Amazon, its response was, "No, you are not leaving the relationship."[1652] PopSockets did sever its relationship with Amazon Retail for a period of time, but reestablished it about a year later.[1653] Mr. Barnett estimates that in 2019 his company incurred losses of $10 million in revenue from when he stopped selling to Amazon Retail and Amazon blocked one of his authorized distributors from selling on the marketplace.[1654]

Subcommittee staff learned about numerous other instances of Amazon employing strong-arm tactics in negotiations. A company that conducts business with multiple divisions of Amazon described how the platform leveraged its dominance in e-commerce to force acceptance of certain terms and conditions during negotiations over a different part of its business.[1655] According to this company, Amazon knows the power they have as a retailer. In the midst of negotiations, the platform repeatedly referenced its power to destock the company's products on Amazon.com as a "bargaining chip to force terms" unrelated to retail distribution on the company.[1656] The company added, "Amazon know[s] they

have a lot of power [in retail e-commerce] and they are not afraid to use it to get terms they want in other markets."[1657]

Book publishers described a similar asymmetric power dynamic with Amazon. According to one publisher, "Amazon has used retaliation . . . to coerce publishers to accept contractual terms that impose substantial penalties for promoting competition" with Amazon's rivals.[1658] The publisher added that the platform's retaliatory conduct shows "Amazon's ability and willingness to leverage its market power to prevent publishers from working effectively with rival e-book retailers and, thereby, maintain and enhance its dominance in e-book distribution."[1659] Amazon's retaliatory tactics against publishers include removing the "buy" button, which blocks a customer's ability to purchase a publisher's current titles;[1660] and removing the "pre-order" button, which eliminates the ability for a consumer to pre-order a publishers' forthcoming titles.[1661] Another form of retaliation that Amazon reportedly engaged in was showing publishers' titles as out of stock or with delayed shipping times.[1662] According to credible reports, Amazon used these tactics in its public battle with Hachette Book Group in 2014 over e-book pricing,[1663] and has used them or threatened to use them in more recent negotiations.[1664] Publishers, authors, and booksellers have "significant fear" because of Amazon's dominance.[1665]

Amazon can treat sellers in this manner because it knows that sellers have no other realistic alternatives to the platform. As Mr. Barnett noted in his testimony:

> When there is bullying by an extremely successful company with all these partners that continue to do business with it, one has to ask how is it that such a successful business maintains partnerships with so many companies while bullying them. It is because of the power asymmetry . . . that companies tolerate this.[1666]

[1665] Interview with Ass'n of Am. Publishers, Authors Guild & Am. Booksellers Ass'n (Aug. 26, 2020).

[1666] Competitors Hearing at 23 (statement of David Barnett, CEO & Founder, Popsockets LLC).

A recent complaint filed against Amazon described the situation as follows, "From the third-party retailers' perspective, Amazon Marketplace is like Hotel California, a lovely place to start or expand an online retail business, but check out from Amazon Marketplace and you can quickly find your business in bankruptcy."[1667] Additional comments from sellers that Subcommittee staff interviewed include, "We're stuck. We don't have a choice but to sell through Amazon,"[1668] and, referring to Amazon, "They've never been a great partner, but you have to work with them."[1669]

As Stacy Mitchell, Co-Director of the Institute for Local Self-Reliance, noted during the Subcommittee's hearing on Innovation and Entrepreneurship, "Among the most egregious examples of Amazon's arbitrary treatment of sellers are its abrupt suspensions of their accounts, frequently made without explanation."[1670] Once Amazon suspends a seller's account or delists its products, the business is left with largely ineffective remedies as they watch their sales disappear. Sellers shared with Subcommittee staff that communications to Amazon's Seller Support Central generally prompt automated, unhelpful responses, which may be entirely unrelated to the specific case, question, or concern raised by the seller.[1671]

The founder of an infant product sold on Amazon told Subcommittee staff that after her products were mistakenly delisted, "[i]t would take weeks of repeated calls—at least 10 or 15 contacts with Seller Support—before somebody inside would determine that it was a mistake and error," and take action to fix the problem.[1672] She stated that this happened at least six times, and that in each instance her listings would be down for two to three weeks at a time.[1673] Describing how Amazon's mistakes can threaten a new business's survival, this small-business owner said:

> When you're a new company and Amazon suddenly delists you, it creates fear in the customer. "Where did it go? Is there something wrong with the product? What happened?" If a customer searched and it's no longer there, they're unlikely to ever come back and buy it . . . You've probably lost that customer for good.[1674]

[1674] *Id.*

In another example, a third-party bookseller told Subcommittee staff that Amazon delisted 99% of his business's inventory in September 2019.[1675] The bookseller requested that Amazon return its products, which were stored in Amazon's warehouses.[1676] As of July 2020, Amazon had only returned a small fraction of the bookseller's inventory and continued to charge him storage fees.[1677] Amazon blocked the bookseller both from selling its products on its marketplace and retrieving its inventory, precluding the seller from trying to recover some of his losses by making sales through another, albeit lesser, channel. At the Subcommittee's sixth hearing, Representative Lucy McBath (D-GA) presented the bookseller's story to Mr. Bezos, who responded that this treatment is "not the systematic approach that [Amazon] take[s]."[1678] However, evidence Subcommittee staff collected through extensive seller interviews shows that Amazon's poor treatment of sellers is far from an isolated incident—a fact supported both by public posts on Amazon's Seller Central forum,[1679] as well as pleas for help routinely sent directly to Mr. Bezos.[1680]

Because of the severe financial repercussions associated with suspension or delisting, many Amazon third-party sellers live in fear of the company.[1681] For sellers, Amazon functions as a "quasi-state," and many "[s]ellers are more worried about a case being opened on Amazon than in actual court."[1682] This is because Amazon's internal dispute resolution system is characterized by uncertainty, unresponsiveness, and opaque decision-making processes.

[1682] Josh Dzieza, *Prime and Punishment: Dirty Dealing in the $175 Billion Amazon Marketplace*, THE VERGE (Dec. 19, 2018), https://www.theverge.com/2018/12/19/18140799/amazon-marketplace-scams-seller-court-appeal-reinstatement.

Additionally, the sellers interviewed by Subcommittee staff generally indicated that Amazon's customer service and treatment towards them have declined significantly in recent years. One business owner, who has been selling on Amazon for over a decade, told Subcommittee staff that in the past, a seller could get meaningful assistance by talking to an Amazon representative over the phone.[1683] He said, "I used to think that Amazon was a partner," but, now, "I don't think they care about the third party seller . . . . They treat us as a commodity."[1684] Internal Amazon documents suggest that the company's hyper-focus on a cost-cutting strategy to adopt automated processes for nearly everything—which Amazon refers to as "HOTW" or "Hands off the wheel"[1685]—combined with the platform's monopoly power over sellers may be to blame for Amazon's atrocious levels of customer service for sellers.

Amazon has recently monetized the degradation of its seller services, rolling out a program where sellers can pay an extra fee for a dedicated account representative. Sellers are supposed to pay for representatives to help them solve the very problems that Amazon created in the first place. Many sellers say, however, that even with paid Amazon account managers they are often unable to get their issues resolved. One seller told Subcommittee staff, "It [i]s a problem that an algorithm can make a decision that just shuts off my income stream and there's nothing I can do to get it back . . . . The only thing I can do to get it back is pay $6,000 a month for a dedicated rep and even then, it doesn't always work."[1686]

The last resort for sellers facing these circumstances is the "Jeff Bomb," or "Jeff Letter," in which a seller sends an email to Mr. Bezos to plead their case.[1687] As the Online Merchants Guild explained in its submission, "a 'Jeff Letter' is almost like a Writ of Certiorari within Amazon's internal kangaroo court system."[1688] But by the time this point is reached, "a seller could be locked out of their account, or denied funds, for weeks, losing hundreds of thousands of dollars even if the mistake was

Amazon's."[1689] Because of the large volume of sellers who reach this point of last resort, sending a "Jeff Letter" is not a realistic avenue for most sellers to get their issues addressed.

2) Forced Arbitration

All of Amazon's third-party sellers and most of its vendors are subject to a pre-dispute, binding ("forced") arbitration clause,[1690] requiring them to sign away the right to their day in court if a dispute with Amazon arises. Subcommittee staff heard from sellers who said that if it were not for Amazon's market power over them, they would not agree to this term.[1691] As noted by the Online Merchants Guild, "Through arbitration, Amazon knows it holds all the cards, and in many ways has the final say whenever there is a dispute."[1692] As a result, sellers rarely initiate arbitration actions against Amazon. Between 2014 and 2019, even as the number of Amazon sellers continued to grow by hundreds of thousands per year, only 163 sellers and 16 vendors initiated arbitration proceedings.[1693] Because sellers are generally aware that the process is unfair and unlikely to result in a meaningful remedy, they have little incentive to bring an action.

As extensive scholarship has shown, forced arbitration often fails to provide a legitimate forum for resolving disputes and instead usually serves to insulate those engaging in wrongdoing from liability.[1694] The case of Amazon sellers is no different. In practice, arbitration functions as a way for Amazon to keep disputes within its control, with the scales tipped heavily in its favor. As such, Amazon can withhold payments from sellers, suspend their accounts without cause, and engage in other abusive behavior without facing any legal consequences for its actions.[1695]

3) Seller Fee Increases

Amazon's treatment of sellers indicates that it sees them as a source of profit, rather than
"Amazon's treatment of sellers indicates that it sees them as a source of profit, rather than

[1695] *See* Submission from Online Merchants Guild, to H. Comm. on the Judiciary, 3 (Oct. 29, 2019) (on file with Comm.).

"partners."[1696] Individuals and small businesses who depend on access to the platform to make sales report that Amazon has raised seller fees significantly over the past decade. Over the past five years, a recent Institute for Local Self-Reliance report estimates that Amazon added an extra 11% to its cut of third-party sales.[1697] The platform now takes an average of 30% of each sale compared to 19% in 2015.[1698] In 2018, third-party sellers paid Amazon $39.7 billion in fees, which totaled about 25% of Amazon's $160 billion in Gross Merchandise Volume.[1699] This amount includes commissions, fulfillment and shipping fees, and other third-party seller services, but does not include revenue from the advertising fees for third-party sellers,[1700] which are often substantial.[1701] An internal Amazon document suggests the company can increase fees to third-party sellers without concern for them switching to another marketplace. The document notes that the amount of "seller attrition as a result of [2018] fee increases" for its Fulfillment by Amazon program was "[n]othing significant."[1702]

Amazon's pattern of exploiting sellers, enabled by its market dominance, raises serious competition concerns. For many sellers, there is no viable alternative to Amazon, and a significant number of sellers rely on its marketplace for their entire livelihood.[1703]

4) Appropriation of Third-Party Seller Data

One of the widely reported ways in which Amazon treats third-party sellers unfairly centers on Amazon's asymmetric access to and use of third-party seller data.[1704] During the investigation, the Subcommittee heard repeated concerns that Amazon leverages its access to third-party sellers' data to

1704 Innovation and Entrepreneurship Hearing at 5 (statement of Stacy Mitchell, Co-Dir., Inst. for Local Self-Reliance) ("Amazon's [gatekeeper power] allows it to maintain a God-like view of the transactions of rival businesses and customers, and use this data to move into new markets with a built-in advantage.").

identify and replicate popular and profitable products from among the hundreds of millions of listings on its marketplace.[1705] Armed with this information, it appears that Amazon would: (1) copy the product to create a competing private-label product[1706]; or (2) identify and source the product directly from the manufacturer to free ride off the seller's efforts, and then cut that seller out of the equation.[1707]

Amazon claims that it has no incentive to abuse sellers' trust because third-party sales make up nearly 60% of its sales, and that Amazon's first-party sales are relatively small.[1708] Amazon has similarly pointed out that third-party listings far outnumber Amazon's first-party listings.[1709] In a recent shareholder letter, CEO Jeff Bezos wrote, "Third-party sellers are kicking our first-party butt. Badly."[1710] In response to a question from the Subcommittee, however, Amazon admitted that by percentage of sales—a more telling measure—Amazon's first-party sales are significant and growing in a number of categories. For example, in books, Amazon owns 74% of sales, whereas third-party sellers only account for 26% of sales.[1711] At the category level, it does not appear that third-party sellers are kicking Amazon's first-party butt. Amazon may, in fact, be positioned to overtake its third-party sellers in several categories as its first-party business continues to grow.

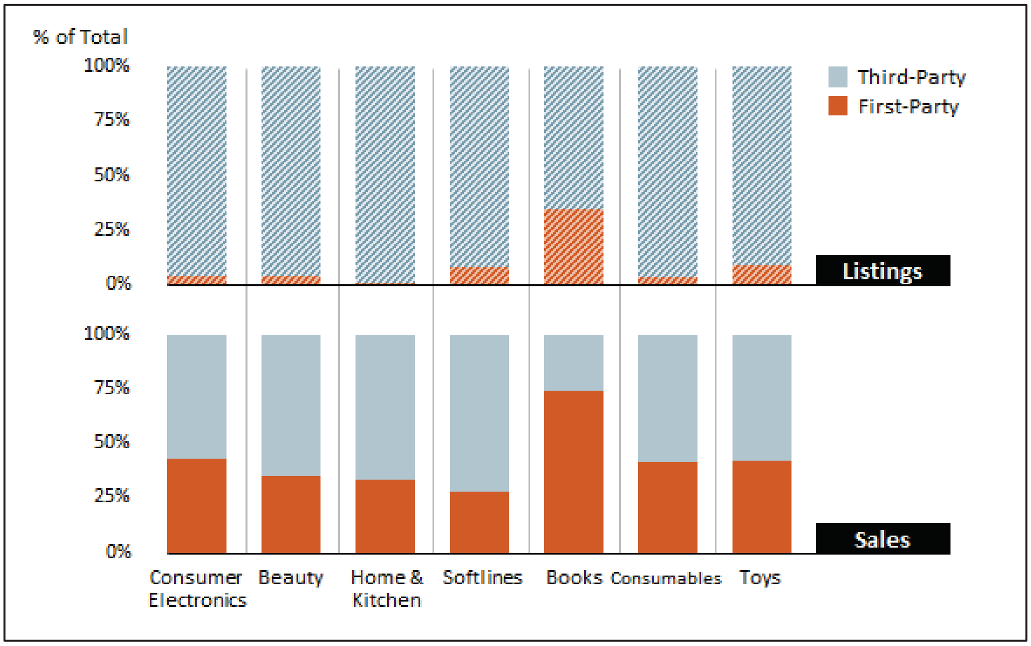
Third-Party vs. First-Part Listings and Sales on Amazon[1712]



Amazon recognizes that it competes against many of its third-party sellers.[1713] In response to concerns about its unfair use of third-party seller data, Amazon points to its Seller Data Protection Policy, which it instituted in 2014.[1714] According to the company:

> Amazon recognizes that third-party sellers are our customers too, and their trust is critical to Amazon's success. In an effort to further this partnership, Amazon decided years ago to take additional voluntary steps to protect seller data by instituting its voluntarily-adopted Seller Data Protection Policy, which prohibits Amazon Retail teams from using non-public seller-specific data to compete against third-party sellers.[1715]

Following up on public reporting and information collected during the investigation suggesting that Amazon might be abusing its access to third-party sellers' data, Representative Pramila Jayapal (D-WA) asked Amazon lawyer Nate Sutton about this precise issue at a Subcommittee hearing in July 2019. Sutton testified: "We do not use [third-party sellers'] individual data when we're making decisions to launch private brands."[1716]

[1716] Innovation and Entrepreneurship Hearing Transcript at 51 (statement of Nate Sutton, Assoc. Gen. Counsel, Competition, Amazon.com, Inc.).

Since the July 2019 hearing, public reporting has made clear that, contrary to its own internal policy and testimony before Congress, Amazon routinely appropriates seller data to benefit its own private-label and retail businesses. After the hearing, according to a July 2019 report, a former employee who worked in product management told *The Capitol Forum*, "I used to pull sellers' data to look at what the best products were when I was there … That was my job."[1717] In September 2019, employees reported to *Yahoo Finance* that access to data is a "free-for-all" and that Amazon Retail and Marketplace teams "share the same access to the data warehouse, which makes it possible for the retail team to use the data from marketplace sellers to develop private labels."[1718]

Earlier this year, in a groundbreaking article, the *Wall Street Journal* reported that executives in Amazon's private-label division "had access to data containing proprietary information that they used to research bestselling items they might want to compete against, including on individual sellers on Amazon's website."[1719] In one case, Amazon employees reportedly used non-public sales data about a third-party seller of car-trunk organizers named Fortem to develop an Amazon private-label version of the very same product.[1720]

In light of the April 2020 report from the *Wall Street Journal*, the Committee requested that Jeff Bezos testify before Congress to address the possibility that Amazon's lawyer had misled Congress.[1721] Despite significant public reporting on the issue and references to it in Amazon's internal documents, Mr. Bezos claimed to be unaware of these practices. According to Mr. Bezos, "Amazon first learned about the alleged violations of Amazon's voluntarily adopted Seller Data Protection Policy recently reported in the *Wall Street Journal* from the *Wall Street Journal*."[1722] When Representative Pramila Jayapal (D-WA) again asked in July 2020 about whether Amazon uses third-party seller data to benefit its private-label products, Bezos could only respond: "I can't answer that

Comm. on the Judiciary, to Jeff Bezos, CEO, Amazon.com, Inc. (May 1, 2020) (on file with Subcomm.).

[1722] CEO Hearing at 1 (response to Questions for the Record of Jeff Bezos, CEO, Amazon.com, Inc.).

question yes or no . . . we have a policy against using seller-specific data to aid our private-label business, but I can't guarantee you that that policy has never been violated."[1723]

Representative Ken Buck (R-CO) similarly raised this issue with Mr. Bezos, stating, "I'm concerned that you've used Amazon's dominant market position to unfairly harm competition. We've heard from a number of companies that Amazon uses proprietary data from third-party companies to launch its own private-label products."[1724] Later in the hearing, Representative Kelly Armstrong (R-ND) described this as an "important issue," and asked whether "Amazon is conducting an internal investigation into the use of third-party data," to which Mr. Bezos answered in the affirmative. Mr. Bezos agreed to inform the Subcommittee of the outcome of that investigation.

In October 2020, approximately six months after Amazon said that it had initiated the investigation,[1725] the company informed the Committee that it had completed it.[1726] According to Amazon's Vice President of Public Policy, Brian Huseman, "Amazon's records of past data queries related to the two products cited in the *Wall Street Journal* report show that a single former employee pulled and analyzed only aggregate data for both products in compliance with the Seller Data Protection Policy."[1727] The results of this limited investigation do not alter the views of Subcommittee staff on Amazon's use of third-party seller data as set forth in this Report.

Subcommittee staff uncovered evidence in interviews with former Amazon employees, as well as current and former sellers, that is consistent with the public reporting about Amazon's misuse of seller data.[1728] In a submission to the Subcommittee, a former employee said:

> In 2010, I started working on the Amazon marketplace team … It was widely known that many (10+) of my peers were running very successful [third-party] accounts, where they were pulling private data on Amazon seller activity, so they could figure out

[1728] *See* Submission from Nat'l Ass'n of Wholesaler-Distributors, to H. Comm. on the Judiciary (July 22, 2020) (on file with Comm.) (describing a member's experience in which Amazon allowed a distributor to sell a product for about a year, "then went out and replicated the product and began selling their own branded product, terminating the distributor . . . Amazon became the winner and the distributor was left empty handed").

market opportunity, etc. Totally not legitimate, but no one monitored or seemed to care.[1729]

Referring to accessibility of third-party seller data, the same individual told Subcommittee staff, "It's a candy shop, everyone can have access to anything they want," and added, "There's a rule, but there's nobody enforcing or spot-checking. They just say, don't help yourself to the data … it was 'wink wink,' don't access."[1730]

Subcommittee staff interviewed a third-party seller who described how Amazon uses a request for proof of authenticity to collect proprietary information about a seller's business. According to the seller, Amazon will submit a product authenticity claim to sellers, forcing the retailer to submit their original sales receipts as proof that the items are authentic.[1731] Although a seller is supposed to be able to black out price information, sometimes the platform will reject a submission on the basis that is an "altered document."[1732] With insight into the seller's costs and supplier, combined with its knowledge of the seller's retail price among a virtually unfathomable amount of other data, it appears that Amazon Retail can easily replicate the seller's listing to offer a competing product.

A former third-party seller and retired U.S. Marine told Subcommittee staff about several instances over his seventeen years as a seller when Amazon leveraged his work, undercut him on price, and eventually drove him out of business. In each instance, he had to change his business model after Amazon took over the Buy Box for his listings, "killing" his sales.[1733] On at least two different occasions, his company did all the legwork to create a new, top-selling product or product line, as well as creating the product listings, only to have Amazon copy the idea and offer a competing product. Amazon used different tactics each time, but the result was always the same: Amazon profited from his work and made it impossible for him to fairly compete.[1734]

As part of his last attempt to sell on Amazon, his business created its own line of table game products with a unique design and color palette. Once these products became top sellers, Amazon again swooped in to reap the rewards of his work. Amazon copied his designs, down to the color palette, and started selling their competing products at unsustainable prices. Ultimately, he exited his seller business, gave up on trying to bring new products to consumers, and founded a consulting agency for Amazon sellers.[1735]

In addition to its private-label business, Amazon also uses third-party seller data to benefit its Amazon Retail business, where the company functions more like a retailer. At the Subcommittee's sixth hearing, Chairman David N. Cicilline (D-RI) asked Mr. Bezos about this conduct, recounting the story that a former third-party seller shared with Subcommittee staff:

> During this investigation, we have heard so many heartbreaking stories of small businesses who sunk significant time and resources into building a business and selling on Amazon, only to have Amazon poach their best-selling items and drive them out of business.
>
> So I want to talk to you about one company that really stood out from the rest. I want you to pay close attention to how they described your partnership, Mr. Bezos. We heard from a small apparel company that makes and sells what they call "useful apparel" for people who work on their feet and with their hands, like construction workers and firefighters.
>
> This particular business discovered and started selling a unique item that had never been a top seller for the brand. They were making about $60,000 a year on just this one item. One day, they woke up and found that Amazon had started listing the exact same product, causing their sales to go to zero overnight. Amazon had undercut their price, setting it below what the manufacturer would generally allow it to be sold so that, even if they wanted to, they couldn't match the price.[1736]

Amazon has tried to draw a meaningful distinction between individual and aggregate data, but this is largely beside the point when it comes to the concerns that Subcommittee members have about the platform's conduct and its effect on competition. Amazon says it only uses "aggregate" seller data across multiple sellers, not "individual" data about any specific seller.[1737] Importantly, though, it chooses how those terms are defined and uses various methods to deem seller data as aggregate rather than individual. According to the *Wall Street Journal* report, because Fortem accounted for 99.95% of total sales in the car-trunk organizer product category, not 100%, Amazon considered that data aggregate rather than individual.[1738] And at the Subcommittee's hearing in July 2020, Bezos confirmed that Amazon indeed allows the use of aggregate data to inform private-label brands when there are

AR_003571

only two or three sellers of a product.[1739] Separately, if there is only one seller of an item, and Amazon is selling returned or damaged versions of that item through its Amazon Warehouse Deals program, that data is considered aggregate.[1740]

An Amazon "Frequently Asked Questions" (FAQ) document from 2014 suggests that Amazon was aware that the Seller Data Protection Policy had significant loopholes. For example, the document indicates that even seller-specific data can be used for "strategic business decision at the category level or above."[1741] The answer to an FAQ also makes clear that the line between "aggregated" data and "Seller-specific" data is fuzzy: "As a general rule, if information isn't directly tied or easily attributed to a specific Seller, it can be considered aggregated and non-Seller-specific." As to how aggregated information attributed to a small group of Sellers should be treated, the guidance is also ambiguous: "This is a high judgment area. If Seller-specific information could be easily derived from aggregated information, it should be treated as Seller-specific."[1742]

In addition to collecting data relating to sales, Amazon may also be able to reverse engineer third-party sellers' cost structures through the tools that it offers sellers to track profits, costs, ad spend, and other expenses, as well as fulfillment services through Fulfillment by Amazon (FBA). An internal document suggests that Amazon may use its FBA service as an avenue to identify popular third-party seller items and gather competitively sensitive information about them.[1743] FBA provides another avenue for Amazon to access competing sellers' third-party data.

The documents and information that Subcommittee staff reviewed suggest that instances of Amazon's data misappropriation go beyond what is in the public domain. Furthermore, Subcommittee staff rejects Amazon's contention that Amazon's use of third-party seller data is no different from a traditional brick-and-mortar retailer's use of data. Subcommittee staff also does not believe that the marketplace-derived data the platform uses to inform Amazon Retail's product pipeline, among other decisions, is equally available to all Amazon Marketplace sellers.

On many fronts, Amazon makes inconsistent arguments depending on the forum and issue in support of its attempts to escape liability. In the context of lawsuits regarding liability for counterfeits

and unsafe products sold on its site, Amazon insists it is a marketplace and not a retailer.[1744] By contrast, in his testimony before the Subcommittee, Mr. Bezos referred to Amazon as a "store" and a "retailer."[1745] Similarly, when Nate Sutton testified before the Subcommittee, he stated, "Amazon is one of the leading retailers."[1746] In response to price gouging allegations, Amazon switches back to the position that it is just a marketplace. As Public Citizen observed in a recent report titled *Prime Gouging*:

> Amazon is trying to have the best of both worlds by enabling third-party sellers to exploit the crisis (and benefiting from facilitating those sales), but also seeking to immunize itself from responsibility for directly engaging in price gouging by shifting the focus on to the unscrupulous actions of third-party sellers, not only in the eye of the public but also in the eye of the law.[1747]

Amazon identified a few types of non-public seller data that it has access to, but which are supposed to be protected by its Seller Data Protection Policy.[1748] It is obvious from this small glimpse into the data Amazon has at its disposal that the type and scope of data the platform can access is very different from the information available to traditional brick-and-mortar stores. Physical stores have much less detailed information about the competing products they offer for sale alongside their private-label items. Physical stores also have far less information about customers' shopping habits and preferences.[1749]

5) <u>Self-Preferencing</u>

By virtue of its role as an intermediary in the marketplace, Amazon can give itself favorable treatment relative to competing sellers. It has done so through its control over the Buy Box, as well as by granting itself access to data and tools that are off-limits for third-party sellers. Most recently, there have been reports that Amazon has given preferential treatment to its own non-essential products over competitors' non-essential products during the pandemic.

[1749] *See* Stigler Report at 45 ("Traditional brick-and-mortar stores and online platforms differ greatly in their advertising and personalization capabilities.").

a) Critical Inputs

Amazon has control over critical inputs for competing sellers and other types of competitors—including consumer data, fulfillment and delivery services, and advertising and other marketing tools—that give it the ability to advantage itself over rivals. During the investigation, Subcommittee staff conducted numerous interviews with market participants that, along with credible public reporting and Amazon's documents, confirm that Amazon employed this business strategy as early as 2009 and continues to do so today.

b) Access to Market Data

Amazon has access to data that gives it greater insight into consumer behavior and preferences than competing sellers on its platform. A former Amazon employee that Subcommittee staff interviewed summarized the significance of this information asymmetry:

> It's important to understand that Amazon has access to every piece of data on what products each customer has searched and purchased [or] not purchased. . . . With information about what customers have searched, Amazon is able to create customized marketing [and] targeting of products for the individual customer. "Is Amazon using a particular [third-party] seller's data here? No," but it is using all of the aggregate site data to develop a highly targeted marketing plan for each customer. Should Amazon choose to use that targeting information to focus [on] its own products, it can, while [third-party] sellers don't have access to similar data.[1750]

Although Amazon provides its sellers with access to some helpful data and tools—which is a key differentiator from other marketplaces with no or limited seller tools—there is a large amount of data that is off-limits, only available at a largely prohibitive cost, or unhelpful because it is outdated or inaccurate. One paid service that Amazon offered sellers was called Amazon Retail Analytics Premium. Sellers who paid extra to participate in this program could access some, but not all, of the data Amazon collected on marketplace activity. But the program was expensive: vendors reportedly had to pay a minimum of $30,000 to get access to this database.[1751]

Another example of this asymmetric access to data is evident from an Amazon internal email discussion. The discussion began with a consultant alerting Amazon employees about a problem with its Marketplace Web Services APIs that caused it to report information to sellers that is "disconnected

[1750] Submission from Source 91, to H. Comm. on the Judiciary (Sept. 22, 2020) (on file with Comm.).

[1751] Robyn Johnson, *Amazon Just Made the $30k Amazon Retail Analytics Premium Data Free*, SEARCH ENGINE J. (Feb. 26, 2020), https://www.searchenginejournal.com/amazon-retail-analytics-premium-data-free/350692.

from the reality and often misleading."[1752] According to the representative, "This is a huge issue and causes sellers losses and inconvenience."[1753] In response, an Amazon employee said that there was not a problem with the API functionality; rather, the Pricing APIs just do not provide sellers with information at the level of granularity requested. Further, she explained that this is "a feature request for adding location aware information to the Pricing APIs," which is "currently below the line for 2018 for the pricing team."[1754]

c) Marketing Tools

One tool that Amazon Retail uses to benefit its own business is Amazon Vine, a review-generating program.[1755] In interviews with market participants, many sellers said that good reviews are critical for a product to be successful online.[1756] Accordingly, sellers aim to obtain as many positive reviews as possible early in a product's life cycle. At one time, it was permissible for Amazon sellers to provide incentives such as free samples to reviewers. However, in 2016, it was widely reported that some sellers were generating fake reviews.[1757] In response to these reports, Amazon announced that it would ban incentivized reviews except for those obtained through its own incentivized review program, Amazon Vine.[1758] As a result, sellers lost access to this program, regardless of whether they were engaged in bad conduct or not.

For many years, including after the incentivized-reviews ban, the Amazon Vine program was not available to third-party sellers, while Amazon continued to enjoy the program's ability to "minimize marketing costs associated with generating awareness early in a product's lifecycle," among other benefits.[1759] An Amazon internal document describes other advantages of the program as,

1759 Production of Amazon, to H. Comm. on the Judiciary, AMAZON-HJC-00146732 (Dec. 14, 2017) (on file with Comm.); Spencer Soper, *Amazon Doles out Freebies to Juice Sales of Its Own Brands*, BLOOMBERG NEWS (Oct. 16, 2018), https://www.bloomberg.com/news/articles/2018-10-16/amazon-doles-out-freebies-to-juice-sales-of-its-own-brands.

"[d]rive conversion and sales with more insightful reviews on detail pages," and "can contribute to higher order counts and sales."[1760]

By both banning incentivized reviews and excluding third-party sellers from the Amazon Vine program, Amazon allocated to itself a significant marketing advantage over the other businesses with which it competes on its platform.

Amazon's dual position as both operator and seller on its online marketplace also provides it with the ability to disadvantage competitors that seek to sell or advertise on its platform. One way that Amazon does this is by limiting certain rivals' ability to buy Amazon.com search advertising—ads that present products at the top of the search results when consumers enter specific search terms or a product name. Although "search advertising is a lucrative part of the company's business," Amazon "won't let some of its own large competitors buy sponsored-product ads tied to searches for Amazon's own devices."[1761] The *Wall Street Journal* reported this month that Roku, Inc. "can't even buy [] Amazon ads tied to its own products."[1762] Consistent with this report, a competitor of Amazon that manufacturers voice-enabled devices told Subcommittee staff that Amazon prohibited it from buying ads on Amazon.com.[1763] The competitor expressed concerns about the harm this could cause consumers, who may be confused or deceived when they receive ads promoting Amazon products even when they specifically search for a competitor's product on Amazon.com.[1764]

The Subcommittee's investigation also uncovered internal documents showing that Amazon executives have long understood the competitive advantage Amazon wields due to the company's control over search advertising on Amazon.com. In an internal email describing an ad block against Groupon and other "deal site ecommerce competitors,"[1765] an Amazon executive wrote that "Groupon is blocked + let's keep a clear line on this. No deal site ecommerce competitors allowed to advertise on amazon.x sites."[1766]

Similarly, an email discussion in 2009 among high-level Amazon executives discussed the possibility of implementing an ad block against Diapers.com, saying:

[1766] *Id.*

> Do we really think it is ok that Diapers.com flipped from selling on the platform to being a large scale user of Product Ads totally unscrrutinized [sic]? I don't. . . . We're under no obligation to allow them to advertise on our site. I'd argue we should block them from buying Product Ads immediately or at minimum price those ads so they truly reflect the opportunity cost of a lost diaper buyer (or to reflect the true value of a new customer to such a competitor.).[1767]

The executive suggests that Amazon should maintain a "watch list" of strategic competitors and set up "[a]n automatic trigger when a merchant on [the] watch list . . . attempts to launch a significant quantity of product ads-with escalated approval required to allow their ads to launch."[1768] The *Wall Street Journal* report, based on discussions with Amazon employees, confirms that Amazon ultimately implemented a plan of this type. According to the report, "Tier 1 Competitors" are blocked from buying certain ads and employees are allegedly instructed to "mark any discussion of this practice . . . with 'privileged and confidential' to evade regulators."[1769]

In March 2020, Amazon announced that it would begin temporarily delaying shipments of all non-essential products from its warehouses, regardless of whether they were sold by Amazon or by competing third-party sellers.[1770] The company claimed it was doing so to better serve customers in need while also helping to ensure the safety of warehouse workers. The effect of this change was to block third-party sellers of items that Amazon designated "non-essential" from shipping new inventory using fulfillment by Amazon.

Amazon reportedly excepted itself from this policy and continued to ship non-essential items sold by Amazon Retail from its warehouses. According to a survey of Amazon workers conducted by Change to Win between April 29 and May 9, 2020, workers reported that Amazon had "continued to ship non-essential items such as hammocks, fish tanks, sex toys, and pool floaties."[1771] More than two-thirds of fulfillment center workers reported that 50% or more of the items they handled during this period were non-essential. Based on the survey results, Change to Win concluded that "Amazon has continued to place workers in danger of contracting COVID-19 in order to ship non-essential goods."[1772] A number of market participants that Subcommittee staff interviewed also indicated that

Amazon prioritized shipping its own items over those sold by third-party sellers.[1773] Amazon confirmed that it did give preferential treatment to its own products for a period of time, but claimed it was "unintentional."[1774]

6) Tying and Bundling – Fulfillment by Amazon and Advertising

a) Fulfillment by Amazon

There is a strong link between Amazon Marketplace and Fulfillment by Amazon (FBA), Amazon's paid logistics service. Amazon uses its dominance in each of these markets to strengthen and reinforce its position in the other.

Amazon's FBA program combines warehousing, packing, and shipping services, and most importantly, access to Prime customers.[1775] For a seller's products to get the Prime badge, which is essential to making sales on the platform, a seller must either qualify for Amazon's Seller Fulfilled Prime (SFP) program or use Amazon's FBA service. On August 18, 2020, Amazon informed sellers of changes to Seller Fulfilled Prime which render it an entirely impractical option for most sellers.[1776] Even before this change, only a very small percentage of sellers could meet the onerous eligibility requirements for Seller Fulfilled Prime.[1777] This means FBA is functionally the only way for sellers to get the Prime badge for their product listings.[1778] A document setting forth draft Q&A before a 2018 earnings call for Amazon Chief Financial Officer Brian Olsavsky explained the connection between Prime and FBA: "Prime and FBA reinforce each other – they are inextricably linked. FBA adds Prime eligible selection. Prime member growth and purchasing habits attract sellers to FBA."[1779]

[1773] *See, e.g.*, Submission from Source 91, to H. Comm. on the Judiciary (Sept. 16, 2020) ("When we looked at Amazon private-label products during April/early May, they were almost all available for immediate Prime delivery, while comparable national brands were not able to get the same shipment times. Definitely preference was given to many Amazon private-label products during times of "essential"/"non-essential" classification."); Interview with Source 152 (Sept. 18, 2020).

[1774] CEO Hearing at 8 (response to Questions for the Record of Jeff Bezos, CEO, Amazon.com, Inc.) ("After instituting these changes, Amazon became aware that shipments of certain Amazon devices that did not fall into the priority categories had been inadvertently included in the list of products with faster delivery promises. This was unintentional.").

[1777] *See, e.g.*, Interview with Jason Boyce, Founder & CEO, Avenue7Media, LLC (Sept. 15, 2020) ("It used to be possible, but hard, to be a Seller Fulfilled Prime seller. There were only 200 sellers that were able to meet the requirements. What's changing recently is that they used to allow you to have the Prime badge in certain regions, but now they say you need the Prime badge nationally, i.e., you need to have multiple warehouses across the country plus ship on Saturdays, etc.").

[1778] Regan McPhee, *How to Sell on Amazon Prime in 2020*, JUNGLESCOUT (May 27, 2020), https://www.junglescout.com/blog/how-to-sell-on-amazon-prime/.

[1779] Production of Amazon, to H. Comm. on the Judiciary, AMAZON-HJC-00186643 (July 23, 2018) (on file with Comm.).

Due to a lack of alternatives, third-party sellers have no choice but to purchase fulfillment services from Amazon. More than 73% of all Marketplace sellers worldwide reportedly rely on FBA services.[1780] Numerous third-party sellers told the Subcommittee that they feel they have no choice but to pay for FBA to maintain a favorable search result position, to reach Amazon's more than 112 million Prime members, and to win the Buy Box—through which the vast majority of Amazon sales are made.[1781] A recent consumer survey indicated that 75% of Amazon Prime customers specifically search for products flagged as Prime-eligible.[1782] As a result, as the Online Merchant's Guild told Subcommittee staff, many sellers will "say that without Prime you are dead."[1783]

In response to concerns about Amazon tying a seller's ability to make sales on its platform to participation in FBA, Amazon has offered contradictory statements. In the Subcommittee's second hearing, Representative Lucy McBath (D-GA) asked Amazon's Associate General Counsel Nate Sutton whether Amazon "privileged vendors who use Amazon Fulfillment Services over those who chose not to."[1784] Mr. Sutton asserted that Amazon "do[es] not favor . . . products that use FBA over others."[1785] He also indicated that Fulfillment by Amazon is not a factor in Amazon's ranking algorithm.[1786]

At the Subcommittee's sixth hearing, Representative Mary Gay Scanlon (D-PA) asked Mr. Bezos about whether there is a connection between a seller's use of FBA and its ability to win the Buy Box.[1787] In response, Mr. Bezos said, "I'm not sure if it's direct, but, indirectly, I think the Buy Box does favor products that can be shipped with Prime."[1788] Given that FBA is effectively the only way for sellers to get a Prime badge, this indicates that Amazon does favor sellers who use FBA over those who do not for both its search rankings and the Buy Box. Amazon claims that it favors sellers who use FBA because it is in the best interest of consumers and that it "does not consider profitability as part of the Featured Merchant Algorithm."[1789] Documents reviewed by Subcommittee staff, however, suggest

that Amazon has used profitability—also referred to internally as "contribution profit" or "CP"—as a factor in awarding the Buy Box.[1790]

Furthermore, Amazon's own documents show that it has considered FBA participation for purposes of determining the Buy Box winner.[1791] An Amazon document that sets forth pricing rules for a pilot program appears to favor third-party sellers that use FBA over those who do not for awarding the Buy Box.

Chance – please sign off (or provide fdbk) before I send to Doug.
Jason
Doug,
You had asked me to help you understand the 'size of the issue' with regards to diverted product as well as clarification on pricing rules/matching for the image competitor simulation in the Healthcare category. Some current data (from February):

1. The top 25 negative CP ASINs in Health & Beauty (all Image ASINs) accounted for $265k in negative CP, 46k units and $1.6M in product revenue.
2. The diverted product ASINs (8 of the top 25) accounted for $109k in negative CP (41% of ttl), 14k units (31% of ttl) and $366k (21% of ttl) in product revenue.
3. Babycare products accounted for 14 of the top 25 ASINs (13 diaper and 1 wipe ASIN) and the remaining 3 ASINs are vendor or operational cost issues that are being addressed.
4. The image competitor pilot in Healthcare will address 6 of the 8 ASINs referenced in #2 (it will not address Align and Alli – both in Nutrition & Wellness)

We do not plan any manipulation to pricing rules in the Healthcare category other than the setting of number of image ASINs to zero.
Use cases (for Pricing Rules): using Prilosec as the example (CP neutral = $27)

Ref #	Use Case	Amazon Landed Cost	Comp Box Price	Comp Shipping Cost	Comp Landed Price	Amazon Match Price	Non-Prime (1% pad to FBA, 2% pad to 3P)	Prime (5% pad)
1	Walmart (Image Competitor)	$27.00	$28.00	$0.97	$28.97	$28.00	Amzn wins buy box	Amzn wins buy box
2	DAB Nutrition (3P) + FBA	$27.00	$26.50	$0.00	$26.50	$27.00	3P wins buy box	Amzn wins buy box
3	DAB Nutrition (3P) + no FBA	$27.00	$26.50	$0.00	$26.50	$27.00	Amzn wins buy box	Amzn wins buy box
4	AlltheTimeWholesale + no FBA	$27.00	$22.00	$4.50	$26.50	$27.00	Amzn wins buy box	Amzn wins buy box

The primary change coming is that we will now lose the buy box if 3P merchants continue to price below CP neutral (we will stop at CP neutral unless matching to an image competitor). As long as Prilosec is priced below $27 landed price (excluding buffers), we will lose the buy box. Currently, the lowest landed is under $20.
Estimated impact (based on simulation completed by the Pricing team) is a 6% negative impact on Healthcare category growth and a $.74/unit positive impact on CP. Using OP2 as the base, this would translate to ($750k) in revenue loss and ($775k) gain in CP. We will begin the pilot in April and will measure results on a weekly basis (with highlights in the pre-WBR as appropriate).
If you have any further questions, please let me know.
Jason

One third-party seller provided the Subcommittee with anecdotal evidence that Amazon favors sellers who participate in Amazon's fulfillment program over sellers who do not. The seller set up an experiment where he sold the same product, one self-fulfilled and the other fulfilled through FBA, and ran different test cases.[1793] The seller found that "Even when the consumer price of the self-fulfilled

[1790] Production of Amazon, to H. Comm. on the Judiciary, AMAZON-HJC-00141750 (Mar. 25, 2010) (on file with Comm.).

[1793] Submission from Source 43, to H. Comm. on the Judiciary, 29 (Oct. 26, 2019) (on file with Comm.).

order was reduced and sold for a lower price (7% lower) than the FBA offer, the FBA still 'won' the 'Buy Box.'"[1794] The seller indicated that, without this favorable treatment for FBA, they would not choose to use FBA, as they found Amazon's fulfillment service was often slower and less reliable than self-fulfillment.[1795]

Although Jeff Bezos told the Subcommittee that Fulfillment by Amazon "is probably the greatest invention that we ever created for sellers," and that "it's working for sellers," information that Subcommittee staff reviewed suggests that it has significant shortfalls.[1796] One third-party seller told Subcommittee staff, "We use both FBA and self-fulfillment, all of our negative comments are on items shipped through FBA."[1797] According to another seller that uses FBA, at one point, Amazon decided to change the packaging on her products from cardboard boxes to padded envelopes, causing damage to her products in transit. When the damaged items started arriving at her customers' homes in a damaged state, this caused a surge of negative reviews and requests for returns. When she asked Amazon to remove these bad reviews, which were caused by FBA's shipping methods, Amazon refused.[1798]

A competing online marketplace described how Amazon effectively forcing sellers into its FBA program makes it more difficult to compete with Amazon for sellers, stating, "[T]hrough anticompetitive strategies and practices by Amazon, many . . . sellers are being pulled into Amazon's tied marketplace-and-ecommerce-fulfilment ecosystem in a manner that makes them not only less independent but directly dependent on Amazon."[1799] It further explained that because of Amazon's dominance in online commerce, "Even sellers who sell on other marketplaces are pushed into FBA, because it is the only practicable way to obtain sales on the Amazon marketplace.[1800] In addition to the Subcommittee's investigation, antitrust enforcement agencies are currently investigating Amazon for tying these two services together.[1801]

b) Advertising

Consistent with public reporting,[1802] evidence that Subcommittee staff reviewed suggests that Amazon may require sellers to purchase their advertising services as a condition of making sales on the platform. Because 44% of consumers tend to only look through the first two search pages when shopping on Amazon, a seller is practically invisible if it does not show up on one of the first two pages.[1803] Amazon's Sponsored Products and Sponsored Brand tools allow sellers to ensure they are prioritized in search results for specific key terms. A 2020 survey of large brands found that at least 73% used Amazon's advertising services, with 65% spending at least $40,000 a month on advertising on the site.[1804] In just one year, the number of brands with this monthly advertising spend increased by 33%.[1805]A recent report issued by the Institute for Local Self-Reliance explained:

> Sellers that decline to advertise risk losing their place in Amazon's organic search results, no matter how many glowing customer reviews they have. That's because the Amazon algorithm that delivers the search results favors products with more sales. As more orders are driven by ads, sellers than don't advertise lose out on those sales and, as their share of sales declines, they also slip in the search rankings, further reducing their sales in a negative cycle.[1806]

Similarly, the Online Merchants Guild told the Subcommittee in a submission, "[i]t is now common belief in the Amazon seller community that the only way to sell on Amazon is through Amazon's Pay-Per-Click ('PPC') offering." The submission describes the situation as "pay-to-play," adding that "[Pay-Per-Click advertising] has become a major point of frustration for many sellers, with many sellers left feeling as if they are paying a mandatory fee, and have even described [Pay-Per-Click] as a way for Amazon to increase their seller fees without looking like they are increasing their seller fees."[1807]

At the same time that advertising services have become "less of an option and more of a requirement for sellers to compete" on the platform, Amazon's ads have also become more

[1806] STACY MITCHELL, RON KNOX & ZACH FREED, INST. OF LOCAL SELF-RELIANCE, REPORT: AMAZON'S MONOPOLY TOLLBOOTH 9 (2020), https://ilsr.org/amazons_tollbooth/.

[1807] Submission from Online Merchants Guild, to H. Comm. on the Judiciary, 8 (Oct. 23, 2019) (on file with Comm.); *see also* Interview with Jason Boyce, Founder & CEO, Avenue7Media, LLC (Sept. 15, 2020) ("Pay-Per-Click is now mandatory.").

expensive.[1808] The ads' costs are determined by reverse auction—businesses bid on keywords that customers may use to search for a given product. In just a year, "the cost-per-click for sponsored ads increased by about 15% on average," and for some, by as much as 127%.[1809] A former third-party seller told Subcommittee staff that this harms both sellers and consumers, adding that "the good old days before [Pay-Per-Click], products would rise on the merits."[1810] Similarly, the Online Merchants Guild said, "[i]n the past, the belief was more reviews would create a trending product."[1811]

In response to concerns about tying, Amazon claims that it provides non-discriminatory access to the Buy Box and that participation in fulfillment by Amazon and its pay-per-click advertising program is voluntary.[1812] Amazon's revenue from these sources is increasing, however, and sellers continue to raise concerns that increased fees for compulsory fulfillment and advertising services are squeezing their business.

7) Strategic Platform Management and Mismanagement

During the investigation, the Subcommittee also heard concerns that Amazon engages in strategic mismanagement of its platform by: (1) allowing the proliferation of counterfeit and unsafe goods; (2) using its ability to control the flow of counterfeits as leverage; and (3) putting in place ineffective counterfeit prevention tools that result in the suspension of a large number of innocent sellers.[1813]

As Amazon's dominance in e-commerce has grown, so has the proliferation of dangerous and counterfeit products on its marketplace.[1814] A 2019 *Wall Street Journal* investigation found that

[1812] *See, e.g.*, CEO Hearing Transcript at 134 (statement of Jeff Bezos, CEO, Amazon.com, Inc.) ("I think what you're referring to is the fact that we offer an advertising service basically for third party sellers to drive additional promotion to their products. That is a voluntary program. Some sellers use it. Some don't.").

[1813] During the investigation, the Committee also heard concerns about Amazon using "brand gating" to block competitors from selling certain products on its platform. *See, e.g.*, Submission from Source 5, to H. Comm. on the Judiciary (Sept. 15, 2020) (on file with Comm.) (raising concerns about "brand gating," which allows Amazon, on its own, or in concert with "a trademark owner/manufacturer/seller, who is registered on the Brand Registry, to block other third party sellers from selling a particular brand, unless certain conditions are met"); Source 100, to H. Comm. on the Judiciary (Jan. 10, 2020) (on file with Comm.) (raising concerns that Amazon "gates" a brand when it decides that it wants to source items directly from the manufacturer and limit competition from third-party sellers and stating, "[w]e have lost literally millions of dollars on [inventory from] brands that Amazon has gated, purchases directly from manufacturers and we are no longer able to sell on Amazon").

[1814] Alexandra Berzon, Shane Shifflett & Justin Scheck, *Amazon Has Ceded Control of Its Site. The Result: Thousands of Banned, Unsafe or Mislabeled Products*, WALL ST. J. (Aug. 23, 2019), https://www.wsj.com/articles/amazon-has-ceded-control-of-its-site-the-result-thousands-of-banned-unsafe-or-mislabeled-products-11566564990.

Amazon had active listings for over 4,000 items "that have been declared unsafe by federal agencies [and] are deceptively labeled or are banned by federal regulators."[1815] In the worst cases, these products have even caused bodily injury or even death to unsuspecting consumers.[1816] As recently as September 2020, CNN released a report describing multiple instances in which Amazon's own private-label products, such as a phone charging cable, have caught fire while in use by consumers.[1817]

The spread of counterfeit products also has serious consequences for vendors and brand manufacturers who rely on consumer trust and their reputation to maintain successful businesses. Amazon's marketplace platform is designed in a way that makes it difficult for consumers to identify counterfeit products. As the Retail Industry Leaders Association (RILA) noted in a submission to the Subcommittee, "Where a platform both obfuscates the origin or source and provides fulfillment services, a seller of counterfeits is harder for consumers to uncover because the item appears to have the backing of the platform."[1818]

Although it claims to take its counterfeit problem seriously, Amazon's business model incentivizes it to do less, not more. Because Amazon's profits increase with the number of sales on the platform, the company has an incentive to turn a blind eye to counterfeit products that contribute to its increased sales volume. Regardless of the source, more sales generally result in more profits for Amazon because it typically "profits twice from a sale through purchase and fulfillment[,] and potentially three times through advertising."[1819]

For example, Subcommittee staff uncovered evidence during the investigation that Amazon has used its ability to police counterfeits more or less aggressively as leverage in contract negotiations with brands who attempt to resist Amazon pressure to sell on its platform—referred to internally at Amazon as "holdouts."[1820] This recently occurred when it agreed to increase efforts to crack down on counterfeit Apple products as part of Apple agreeing to establish a wholesale relationship with Amazon Retail.[1821] Documents received by the Subcommittee suggest that Apple was dissatisfied with Amazon's anti-counterfeiting program and sought the following as a condition of selling Apple

products wholesale to Amazon: "Amazon must proactively monitor platform for counterfeits/knockoffs and cooperate with Apple to remove and prevent them."[1822]

At the Subcommittee's field hearing in Colorado, PopSockets founder David Barnett testified that "Amazon was aware that large quantities" of counterfeit PopSockets products were selling on its platform, but that Amazon allowed the problem to continue until PopSockets agreed to spend nearly two million dollars on Amazon marketing services.[1823] Mr. Barnett further testified that Amazon was not just facilitating the sale of counterfeit PopSockets products, but that Amazon itself was engaged in selling knockoffs. Representative Ken Buck (R-CO) and Representative Henry C. "Hank" Johnson, Jr. (D-GA) confronted Mr. Bezos on Amazon's behavior towards PopSockets at the Subcommittee's sixth hearing. Mr. Bezos responded, "if those are the facts and if someone somewhere inside Amazon said, you know, 'Buy X dollars in ads, and then we'll help you with your counterfeit problem,' that is unacceptable. And I will look into that, and we'll get back to your office with that." To date, however, Amazon has not followed up with the Subcommittee to provide additional information.

In response to criticism and negative publicity about the proliferation of counterfeit products on its platform, Amazon announced several initiatives to combat fake products.[1824] During the Subcommittee's sixth hearing, Mr. Bezos testified that Amazon "invest[s] hundreds of millions of dollars in systems" that police counterfeits.[1825] However, Amazon's approach appears to be ineffective, resulting in suspensions of many innocent, third-party sellers, with devastating effects on some sellers' businesses.[1826]

For example, Subcommittee staff interviewed a former Amazon employee and current consultant for Amazon sellers who described recent unfair changes in Amazon's treatment of sellers suspected of being counterfeiters. He said that, in the past, Amazon would only suspend accounts and withhold funds from third-party sellers it confirmed were selling counterfeit goods.[1827] However, increasingly, "Amazon rejects invoices or fails to verify suppliers without any justification or basis as to why . . . and they are using that as a reason to hold funds indefinitely."[1828]

One third-party seller told the Subcommittee that Amazon blocked some of her listings, citing a number of her products as "inauthentic."[1829] The seller provided evidence to Amazon that, not only were her vendor's products authentic, but Amazon actively sold the same products, sourced from the same vendor, through its first-party sales.[1830] Despite elevating the issue to Amazon executives in July 2020, this issue has still not been resolved as of September 2020.[1831]

ii. Most-Favored-Nation and Price Parity Provisions

Amazon also uses its dominant position in e-commerce as leverage with other businesses to require most-favored-nation (MFN) clauses or similar price parity provisions to guarantee that it will always receive the best prices and most favorable terms. While these clauses are not inherently anticompetitive, Amazon has a history of using MFN clauses to ensure that none of its suppliers or third-party sellers can collaborate with an existing or potential competitor to make lower-priced or innovative product offerings available to consumers.

The anticompetitive effects of Amazon's use of MFN clauses are particularly pronounced in the book market. According to a book publisher, Amazon used its market power in print and e-book sales to force a price MFN on it and other book publishers.[1832] As the publisher explained, the result has been that "publishers are completely handcuffed from stimulating platform competition because Amazon's price MFN causes publishers to incur significant financial penalties if they offer Amazon's rivals better pricing."[1833] Another publisher told the Subcommittee that "Amazon always has and still does require MFNs."[1834] According to this publisher, the MFN provisions prevent publishers from partnering with any of Amazon's competitors and reinforces Amazon's "stranglehold" and "control" over book distribution.[1835] Although Amazon has changed the name and specific mechanisms over the years, it appears that the company continues to impose contract provisions that effectively function as MFNs on book publishers.

In a joint letter to Subcommittee Chairman Cicilline following the Subcommittee's sixth hearing, a group of organizations representing authors, publishers, and booksellers wrote that Amazon's use of MFNs has "stifle[d] the emergence and growth of competitive alternatives in the

[1835] *Id.*

book distribution marketplace."[1836] When Amazon entered the e-book market through its release of the Kindle and Kindle Store in 2007, it unseated incumbent booksellers in market position by offering steep discounts on best-selling books.[1837] Over a decade later, Amazon's dominance in e-books and its anticompetitive application of price parity clauses to its business relationships in this market "eliminate[s] the ability of rivals or new entrants to gain any meaningful competitive advantage relative to Amazon."[1838] Essentially, Amazon disrupted this market, dominated it, and now wields its immense power to effectively guarantee that no competitor could possibly do the same.

Amazon also aggressively enforces price parity rules on Amazon marketplace's third-party sellers. It imposed MFN provisions on U.S. sellers until 2019. In response to antitrust scrutiny, the platform replaced those provisions with a "Fair Pricing Policy," which has the same effect of blocking sellers from offering lower prices to consumers on other retail sites.[1839] To enforce the policy, Amazon uses "computer software to regularly scan listings on competitors' websites, and pressuring their sellers to change their price if their Amazon price is substantially higher."[1840] A violation, or even a perceived violation, of the policy can lead to suspension of a seller's account, with dire consequences for the seller. A former third-party seller explained that Amazon uses "Buy Box Suppression," where Amazon will remove a seller's ability to win the Buy Box, as a way to penalize sellers that offer products at a lower price on competing sites.[1841]

One of Amazon's competitors told the Subcommittee that "as Amazon raises the costs to sellers, and requires that Amazon have the lowest prices available, for a seller to be able to make significant sales on its marketplace, these sellers will raise the price on competitor sites to match Amazon's price."[1842] Amazon's "Fair Price Policy," which has been described as a "thinly-veiled MFN

("Amazon prohibiting sellers from offering lower prices on other online retail platforms clearly hurts consumers if the only way for restriction," is likely anticompetitive with respect to blocking competition from other marketplaces, and does not result in lower prices for consumers as Amazon has claimed.[1843]

iii. Predatory Pricing

As part of its business strategy, Amazon has historically placed a higher premium on long-term growth at the expense of short-term profitability. As noted earlier in this Report, Amazon did not post its first full-year profit until 2003—a decade after the company was founded.[1844] Consistent with this trend, Amazon has adopted a predatory-pricing strategy across multiple business lines at various stages in the company's history.[1845]

Because of the nature of its marketplace business, Amazon's below-cost prices on products and services tend to lock customers into Amazon's full marketplace ecosystem. As a former Amazon employee told the Subcommittee, "[A]bove all else, Amazon's goal is to keep the customer shopping on Amazon."[1846] Once a customer is locked in, they are less likely to change their behavior even when Amazon's pricing is not competitive.

1) Prime

The most prominent example of Amazon's use of strategic losses to lock customers into the platform's ecosystem is its popular membership program, Amazon Prime. As of August 2020, a Prime membership costs $119 per year, up from its original $79 at its launch in February 2005 and $99 from March 2014 to April 2018. An Amazon executive wrote in 2013, in reference to pricing Prime, "the better course is to let the existing Prime program grow . . . and then raise prices later assuming a lower elasticity in future years,"[1847] once customers are locked in.

An Amazon internal document describes the rationale behind Amazon Prime and its other membership programs: "Membership programs are created with a long-term, company-wide perspective with the goal of increasing loyalty and cross-category shopping behavior. The programs do

---

sellers to regain their listing on Amazon is to raise their prices on other platforms or remove their listings all together, therefore limiting competition.").

1843 Submission from Int'l Bhd. Of Teamsters, Commc'n Workers of Am., United Food & Commercial Workers Int'l Union, Service Employees Int'l Union & Change to Win, to H. Comm. on the Judiciary, 4 (March 10, 2020) (on file with Comm.).

not optimize for short-term gain or profitability in a single category."[1848] Another internal Amazon document describes these membership programs as, "[d]oubl[ing] down on 'Big Moats,'" aiming to create an impenetrable barrier around its dominant position.[1849]

Despite Amazon Prime's popularity and wide membership base, it is a loss-leader for the company. Many industry analysts have estimated Amazon's Prime losses over the years, finding that it is unprofitable, and that Amazon is willing to spend significant amounts of money to prop up the program.[1850] In 2016, a Forrester Research analysis estimated that Prime costs Amazon $1 billion per year.[1851] In 2019, J.P. Morgan estimated that, though priced at $119, a Prime subscription is valued at about $860, up 10% from its estimated value in 2018.[1852] A Prime membership also includes access to Prime Video, its library of digital video content, and Amazon Music, its music streaming service.

The Artists Rights Alliance, an advocacy group for the digital rights of music creators, raised concerns that Amazon's inclusion of a streaming music services in its Prime program poses a severe risk of "driv[ing] down royalties in an uncompetitive way."[1853]According to its submission:

> Amazon's ongoing efforts to launch a streaming music service as part of its Prime family of products should be carefully scrutinized . . . . [W]e are concerned about the dangers of predatory/sub-market pricing in a service that Amazon operates as a "loss leader." In general, creators need an economy that more accurately sees and values their work; not one with cut-rate prices that entangles music even more deeply in a web of soulless data collection and 'content distribution' operations.[1854]

Although Amazon Prime is a loss leader for the company, it is one of Amazon's most effective drivers of growth. Amazon Prime members account for 65% of Amazon shoppers as of Q4 2019.[1855]

[1855] Fareeha Ali, *Amazon Prime Has 112 Million Members in the U.S.*, DIG. COMMERCE 360 (Jan. 24, 2020) https://www.digitalcommerce360.com/article/amazon-prime-membership/.

While the average Amazon customer spends about $600 per year on Amazon.com, Prime members reportedly spend more than double that—an average of $1400 per year.[1856]

In 2010, Amazon started its Amazon Mom program, now called Amazon Family, another membership service that offers discounts on diapers and other items associated with parenthood.[1857] At the outset, Amazon was willing to lose money to ensure the success of this program. A 2010 document outlining the lead-up to the official launch of Amazon Mom included a plan to discount diapers and wipes at a rate that would "put [their] product below cost."[1858] And selling diapers was not the goal of this program—instead Amazon recognized that "a long-lasting, sticky relationship" with Amazon Mom members was the source of its true value.[1859] Additionally, an internal presentation observed that "[e]arly results from our Amazon Mom program" showed that "[n]ew Amazon customers, whose first purchase included diapers, spend over three times as much ($292 vs. $91) during their first year as the average new Amazon customer."[1860]

Some of Amazon's rivals view this dynamic as harmful to competition, saying that Amazon is "[u]nderpricing Prime to consumers to build a huge and highly targetable share of ecommerce demand."[1861] Once consumers have paid the yearly fee for Prime, they are incentivized to use it as much as possible to maximize return on their investment, "whereas they might otherwise multisource."[1862]

2) Diapers.com

The Amazon Mom program served another important function and had a central role in one of Amazon's early applications of its predatory-pricing strategy. In 2009, Bezos and other Amazon executives noticed and began discussing the rise of Diapers.com, a competitor in the baby and personal-care product markets.[1863] What followed was a year-long price war, ending in Amazon's eventual acquisition of Quidsi, the parent company of Diapers.com.

[1863] Production of Amazon, to H. Comm. on the Judiciary, AMAZON-HJC-00151723 (Feb. 9, 2009) (on file with Comm.).

At the Subcommittee's hearing, Mr. Bezos testified that Amazon was always a price follower in its war with Diapers.com.[1864] However, Amazon's "'plan to win' against [D]iapers.com" explicitly included price-leading on diapers.[1865] Recognizing that Diapers.com was the company's "#1 short term competitor," Amazon executives decided that going after them required a "need to match pricing . . . no matter what the cost."[1866] Amazon internal documents indicate that Amazon was willing to lose $200 million in one month alone on products in the relevant competitive categories.[1867] Offering 30% cash back on diapers and a free year's worth of Prime membership to Amazon Mom members, an Amazon executive predicted in November 2010 that it would seriously wound Quidsi, stating, "[T]hey expect to lose lots of money over the nxt [sic] few yrs [sic]-this will make it worse."[1868] Quidsi explicitly identified "Predatory Pricing" as a "Near-Term Risk" in a 2009 presentation.[1869] In November 2010, Amazon acquired its self-described "largest and fastest growing competitor in the on-line diaper and baby care space."[1870]

3) "Can't Realize Any Profit"

Once Amazon succeeds in trapping enough customers in its "flywheel" to secure dominant position across varied markets, it can then raise prices or remove incentives or allowances for Marketplace sellers to sell products at favorable prices for consumers. One example of the latter is Amazon's treatment of "CRAP," a term coined internally which refers to products on which Amazon "Can't Realize Any Profit."[1871] CRAP products are low-priced items that are heavy and expensive to ship—often consumables, like packs of bottled water.[1872]

These items were integral to Amazon's pursuit of dominance in the e-commerce market. But once Amazon began to switch its focus from pure growth to profitability, it reversed course on these products, engaging in an ongoing "CRAP-Out Process," by which Amazon attempts to make CRAP profitable through a variety of methods, such as raising delivery fees or requiring vendors to repackage products.[1873] This increases costs for sellers and brands, who have no choice but to acquiesce to the

[1873] Production of Amazon, to H. Comm. on the Judiciary, AMAZON-HJC-00167484 (on file with Comm.) ("How to deal with CRAP.").

changed shipping and packaging rules given their dependence on Amazon for e-commerce sales. Amazon executives acknowledged that CRAP was an element of its plan for growth, noting in a strategy session that, "We want to ensure that if despite all our efforts to improve our cost structure, we lose money on an ASIN [Amazon Standard Identification Number] it is for the long term strategic growth of Amazon."[1874]

Amazon documents provided in response to the Committee's requests show the extent to which Amazon was committed to below-cost pricing. A 2010 review of its baby formula business identified Amazon's "most frequently matched internal competitor" as ABCBabyFormula, which "typically [ ] price[d] 15-20% below [Amazon's] cost."[1875] Identifying this company as the most significant influence on Amazon's baby formula profit loss, the document notes of ABCBabyFormula that "[m]anufacturers do not sell to them directly and believe they are sourcing black market stolen goods."[1876] Amazon frequently price-matched, at significantly below-cost, a competitor that it had reason to believe was sourcing baby formula from illegal and potentially dangerous sources—indicating the lengths to which Amazon was willing to go to ensure product selection and, in turn, growth.

4) Amazon Devices

Finally, Amazon sells its own branded hardware devices on its Marketplace and has often priced those devices below cost in an attempt to corner the market for those devices and adjacent markets. In Amazon's effort to "own the smart home," for example, Amazon sometimes prices its Echo Speaker below-cost. Market estimates suggest that Amazon's Echo Dot third generation materials cost is $37.68,[1877] while the company listed it at $22 during its 2019 Prime Day.[1878] Other market research of Amazon products found that Amazon Echo products are on sale as often as they are at full price.[1879] Illustrating how low prices may not always be in consumers' best interest, Patrick Spence, the CEO of Sonos, testified before the Subcommittee that these pricing habits "hamstring[] those companies that have better products that cannot be sold at a loss."[1880] At the Subcommittee's

hearing, Representative Jamie Raskin (D-MD) raised this concern with Mr. Bezos.[1881] In response, Mr. Bezos responded that the Amazon Echo is "often on promotion, and sometimes when it's on promotion it may be below cost."[1882]

3. Fulfillment and Delivery

a. Market Power

As Amazon's e-commerce business has grown, it has also developed a significant logistics business surrounding fulfillment and delivery of third-party orders with its Fulfillment by Amazon (FBA) program. More than 73% of all Amazon Marketplace sellers reportedly rely on this program to fulfill their orders.[1883] Because of this, a trade association that represents third-party sellers refers to Amazon's fulfillment operation "as the railroad of [e-commerce]."[1884] In addition to its fulfillment operation, Amazon is also one of the largest shippers in the world. The company provides global shipping services for its own products and independent sellers that sell on Amazon.com, as well as other e-commerce sites.[1885]

Amazon's ground shipping infrastructure consists of "trucks, trailers, intermodal containers, and delivery vehicles."[1886] Its truck fleet consists of more than 10,000 trailers.[1887] It also has its own freight airline, Amazon Air, with about 50 leased aircraft,[1888] and plans to expand its fleet to 70 by 2021.[1889] Amazon has also built hundreds of package sorting and delivery centers across the United

[1886] Innovation and Entrepreneurship Hearing at 19 (response to Questions for the Record of Nate Sutton, Assoc. Gen. Counsel, Competition, Amazon.com, Inc.).

[1887] Press Release, Amazon, Continued Growth for Amazon's Air Network (June 28, 2019), https://press.aboutamazon.com/news-releases/news-release-details/continued-growth-amazons-air-network-expand-prime-fast-free.

[1888] Innovation and Entrepreneurship Hearing at 19 (response to Questions for the Record of Nate Sutton, Assoc. Gen. Counsel, Competition, Amazon.com, Inc.).

[1889] Press Release, Amazon, Continued Growth for Amazon's Air Network (June 28, 2019), https://press.aboutamazon.com/news-releases/news-release-details/continued-growth-amazons-air-network-expand-prime-fast-free.

States and has established its own network of contracted delivery providers exclusively dedicated to delivering packages for Amazon.[1890]

In recent years, the size and scope of Amazon's delivery services network have grown significantly. When Amazon first launched Fulfillment by Amazon, it stored products and packed orders in its warehouses, but relied on other carriers to handle shipping and delivery. Today, Amazon ships a growing number of products itself. In 2019, "Amazon delivered about half of its own packages, up from 15 percent just two years before."[1891] Amazon has also lessened its use of large delivery companies during this time, using "800 small, independent contractors [which] are now responsible for around 48 percent of Amazon's last mile deliveries."[1892] These smaller providers are economically-dependent on Amazon, and "many are in fact reliant on Amazon for 100 percent of their business."[1893]

Parcel volume handled by Amazon's delivery service now rivals the top carriers, including UPS, FedEx, and the U.S. Postal Service. "In 2019, Amazon delivered 2.5 billion parcels, or about one-fifth of all e-commerce deliveries,"[1894] and anticipates growth. In a July 2020 investor call, Amazon CFO Brian Olsavsky stated that Amazon "expect[s] a meaningfully higher year-over-year square footage growth of approximately 50%," which includes "strong growth in new fulfillment center space as well as sort centers and delivery stations."[1895]

An analysis by Morgan Stanley concluded that Amazon will overtake UPS and FedEx in market share for delivery by 2022. Amazon has already surpassed the U.S. Postal Service, which has been downsized dramatically under its current leadership.[1896] Last year, the U.S. Postal Service had a decrease in parcel volume for the first time in nearly a decade.[1897]

b. Monopsony Power

Amazon exercises monopsony power in labor markets directly and indirectly. As one of the largest employers in America, Amazon exercises direct power over hundreds of thousands of workers across the United States.[1898] Amazon employees make up 22% of the U.S. labor market in warehousing and storage, excluding seasonal workers.[1899] There has been a growing amount of public reporting in recent years regarding Amazon's treatment of warehouse employees, including strenuous working conditions, unforgiving packing and sorting quotas, and unfair firings.[1900] Amazon warehouses also have a tendency to depress wages when they enter a local labor market. For example, since Amazon opened a warehouse in Lexington County, South Carolina in 2011, the county has seen average annual wages for warehouse workers fall more than 30%, from $47,000 to $32,000 annually.[1901]

Indirectly, Amazon has wage-setting power through its ability to set route fees and other fixed costs for independent contractors in localities in which it dominates the delivery labor market. These entities are dependent on Amazon for a large majority—or even 100%—of their delivery business.[1902] As a result, they have little choice but to "submit to Amazon's prices and other terms."[1903] Amazon's dominance also enables it to compel logistics employees to quit their jobs and instead act as independent contractors, removing employment protections. A group of labor unions stated in their submission to the Subcommittee, "By virtue of its size and power as a buyer of delivery services, Amazon can impose monopolistic restraints on the treatment of workers within its supply chain while, at the same time, avoiding legal responsibility for their fair treatment."[1904]

Despite the loss of jobs and economic activity in the wake of the COVID-19 pandemic, Amazon's monopsony power has likely increased. In response to higher demand for goods and

services, Amazon hired 175,000 temporary workers in March and April of 2020, making 125,000 of those jobs permanent in May 2020.[1905]

4. Alexa's Internet of Things Ecosystem

a. Overview

Amazon has significant investments in the Internet of Things ecosystem, centering its strategy around Amazon's voice assistant, Alexa. In 2014, Amazon launched the Alexa-enabled Echo smart speaker.[1906] Since then, Amazon has built the largest ecosystem of devices and applications connected to the Internet of Things,[1907] creating a broad portfolio of services, development tools, and devices for its Alexa platform. Amazon's research and development team, Lab126, leads the development of Amazon's Internet of Things hardware expansion, including the development of Amazon Echo and Fire TV.[1908] These devices represent a "critical touchpoint that generates insights into user behavior, which can then be used to deepen the relationship with consumers and expose them to new products through personalized recommendations."[1909] Amazon encourages consumers to use Alexa through its Echo smart speakers and other Alexa compatible devices, ranging from smart microwaves to its Echo Frames.[1910]

In 2015, Amazon launched a kit for independent developers to access Alexa in the cloud and create new Alexa apps, which Amazon refers to as "skills."[1911] Two years later, in an effort to expand its ecosystem of devices, Amazon launched Alexa Voice Service. This suite of services allows manufacturers of hardware with microphones and speakers to receive and respond to Alexa voice

commands, making the device "Alexa-enabled,"[1912] or "Alexa built-in."[1913] Additionally, Amazon oversees Works with Alexa, an Alexa-compatible device certification program for devices that receive commands through an Alexa-enabled device, such as a smart speaker.[1914] Amazon does not charge third-party device manufacturers for access to its integration services, which promotes rapid adoption of Alexa in a larger number of devices, which, in turn, drives greater adoption by consumers.[1915]

These programs indicate that Amazon is focused on expanding Alexa's reach rather than short-term profitability, consistent with the early stages of its marketplace strategy. Amazon CFO Brian Olsavsky confirmed this in an earnings call in July 2019, saying that the company's "emphasis is around expanding the reach of Alexa and the usefulness."[1916] He added that at the time, Alexa had "over 45,000 skills" and was in "over 13,000 smart home devices from 2,500 unique brands."[1917]

Lastly, Amazon's Alexa ecosystem is a major source of consumer data; it tracks if the home owner's lights are off and the events on their calendar.[1918] Amazon is also building a series of devices that allow people to have "Alexa in [their] ears, on [their] eyes, and around [their] fingers."[1919]

b. Market Power

Amazon's Alexa represents one of three emerging voice assistant platforms domestically, along with Google Assistant and Apple's Siri, but has a more expansive collection of integrated devices and voice applications than its competitors.[1920] The Echo collection of smart speakers—the hub of Alexa's ecosystem—captures over 60% of the smart speaker market in the U.S.[1921]

1920 *See infra* Section IV.

1921 Submission from Source 38, to H. Comm. on the Judiciary, 7 (Sept. 1, 2019).

As of September 2019, there were 85,000 Works with Alexa devices available for consumers to purchase.[1922] The current network of Alexa-enabled devices includes companies like Sonos, Hewlett-Packard, and BMW.[1923] The U.S.-based Alexa Skills Store as of January 2020 includes 70,729 skills.[1924] In comparison, as of December 2019, Google's voice application ecosystem had just over 18,826 Google Actions.[1925]

The voice assistant market has strong entry barriers due to the significant investments required to compete in the market. These include investments in artificial intelligence, voice-enabled hardware, and cloud computing infrastructure, which are critical inputs Amazon has been developing for years. Amazon's Alexa Voice Service is also hosted on Amazon Web Services, allowing it to bind products and developers to its cloud platform. [1926] In turn, this relationship gives Amazon a potential head-start on turning its Alexa business partners into customers through the cross-sale of Amazon Web Services and other Amazon products and services down the line.

Voice assistants collect significant amounts of personal data and learn users' preferences over time. For example, when Alexa users add more devices that integrate with Alexa, they often manage the settings for these devices through mobile applications and websites that are tied to their Amazon credentials, thereby creating a robust user profile. [1927] As Amazon continues to expand Alexa's reach, this customization of features allows Amazon to better "understand" its users, which may affect their willingness to retrain a new voice assistant.[1928] In addition to the cost of replacing their devices, this friction—retraining a new voice assistant—may increase costs associated with switching to another voice assistant ecosystem.

c. Merger Activity

Amazon has expanded its voice assistant ecosystem by acquiring artificial intelligence companies to strengthen Alexa's functionality and voice-enabled device manufacturers to expand

Alexa's reach.[1929] In 2011, Amazon acquired Yap, a speech recognition platform.[1930] The next year, in 2012, Amazon acquired Evi, a technology for understanding natural language.[1931] Over the years, Amazon has continued to acquire other businesses engaged in natural language processing, machine learning, and other related technologies in support of its continued efforts to improve Alexa's artificial intelligence functionality.[1932]

One of Amazon's strategic goals for Alexa has been to use its voice assistant to reinforce the company's dominance in e-commerce and strengthen its presence in offline retail. In 2017, Amazon acquired Graphiq, a technology company that collects and organizes details about "products, places, and people to simplify online research."[1933] This acquisition appears to have been part of Amazon's effort to improve Alexa's overall search capabilities, most notably product search, as the technology includes "features to tailor comparisons around individual preferences."[1934]

In 2017, Amazon purchased Blink, followed by Ring in 2018—both to solidify its position in the home security market.[1935] In an internal document, Amazon recognized that security could "feed our flywheels (Prime, Alexa) while being a large, profitable business in its own right."[1936] Prior to these acquisitions Jeff Helbling, Vice President at Amazon, emailed a group of Amazon executives, recapping a discussion on the transactions he had with Mr. Bezos. There, he detailed the twin justification for the acquisitions, saying that "two senses matter—eyes and ears."[1937] Amazon had already locked down "ears" through its continued development of Alexa. Ring and Blink would act as Amazon's "eyes" right outside the home.

Amazon's internal documents show that, in large part, it purchased Ring to capture the company's share of the smart home security market. In December 2017, Mr. Bezos wrote to Dave Limp, the Senior Vice President of Devices & Services, that Amazon was really "buying market

position" by acquiring Ring.[1938] During the Subcommittee's sixth hearing, Representative Jamie Raskin (D-MD) asked Mr. Bezos about this exchange.[1939] Mr. Bezos responded:

> Sir, market position is valuable in almost any business, and it's one of the primary things that one would look at in an acquisition. There are multiple reasons that we might buy a company. Sometimes we're trying to buy some technology or some IP. Sometimes it's a talent acquisition. But the most common case is market position, that the company has traction with customers, they've built a service, maybe they were the first mover. There could be any number of reasons why they have that market position. But that's a very common reason to acquire a company.[1940]

This response suggests that adding Ring's users to the Alexa ecosystem quickly was also important to Amazon's rationale.

A 2017 internal memorandum further explains Amazon's strategy behind these acquisitions. As the memorandum notes, while acquiring each company independently would make Amazon stronger, acquiring both "would put us in a meaningfully better position than we are today (and we would not want to stake our chances in the segment on closing any one opportunity)."[1941] Douglas Booms, the Vice President of Corporate Development at Amazon, sent an email summarizing the thoughts of other senior executives at the company, which included: "I don't know how we can get big fast in that segment without an [sic] acquiring someone."[1942]

The documents and other relevant information reviewed by Subcommittee staff demonstrate that Amazon acquiring Ring and Blink was in part to expand and reinforce its market power for its other business lines. Internally, Amazon executives discussed how home surveillance acquisitions would help them implement unattended package delivery. Similarly, they discussed the idea that the acquisitions would help Amazon develop its Alexa Doorbell application program interface, an AWS service that allows Alexa Skills developers to build apps that respond to a ringing doorbell.[1943] Amazon referred to this strategy as an "integration approach" to "remove impediments to future growth." [1944]

More recently, Amazon purchased Eero, a mesh networking company, for $97 million in 2019.[1945] The purchase was part of Amazon's strategy to offer "frustration-free setup" for smart home devices in the Alexa ecosystem, another move aimed at removing impediments to growing the platform's presence in the home.[1946] "Amazon Wi-fi Simple Setup" scans the user's Eero network during initial set-up of an Alexa-enabled device, applying the user's stored credentials to automatically connect to other smart devices, such as outlets and Fire TV devices.[1947] To achieve this, Eero must continually understand which devices are connected to the network, including the IP addresses of those devices.[1948] This acquisition gives Amazon access to another important input for consumer data.[1949]

d. Conduct

During the Subcommittee's investigation, market participants raised concerns about Amazon's business practices in the smart home market. As these market participants note, Amazon uses Alexa to favor its own goods and services, including AmazonBasics and Prime Music. Amazon has also imposed barriers to entry for other voice-enabled device manufacturers through predatory pricing of Alexa-enabled devices, and through its dominance as a leading distribution channel for smart home devices.

i. Self-Preferencing

Amazon has the largest voice application "store" of third-party skills, as well as first-party services that represent popular voice assistant applications, such as Amazon Music and an e-commerce platform that it can favor over third-party applications.[1950] Amazon favors its services in Alexa by making them defaults for common voice commands. For example, Amazon.com is the default store for

basic voice commands related to shopping. "Alexa, add milk to my cart," adds milk to the user's Amazon shopping cart.[1951]

Besides favoring Amazon services with default voice commands, Alexa also allows Amazon to favor its retail products over products offered by third-party sellers. When users shop via voice command, they are presented with one spoken offer and an option for a follow-up question, which is distinct from an online user interface that shows the additional offers ranked. This increases the importance of being Alexa's featured offer.[1952]

For example, *The New York Times* reported in 2018 that when a user says, "Alexa, buy batteries," Alexa responds with the AmazonBasics option [1953] Similarly, a study conducted by Bain & Company found that for categories in which Amazon offered a private-label product, Alexa recommended those products 17% of the time, despite its private-label goods representing only about 2% of total volume sold.[1954] During the Subcommittee's sixth hearing, Representative Jamie Raskin (D-MD) asked Mr. Bezos "[H]as Alexa ever been trained to favor Amazon products when users shop by voice?"[1955] Mr. Bezos responded that he didn't "know if it's been trained in that way," but "it wouldn't surprise me if Alexa sometimes does promote our own products."[1956]Amazon chooses the products Alexa suggests based on a range of features, including products that "customers frequently purchase based on their past orders" and Amazon's Choice designation.[1957] Amazon's method for determining "Amazon's Choice" is opaque.[1958]

Amazon minimizes concerns about favoring its first-party goods through voice shopping by highlighting how rare it is for people to purchase goods through Alexa.[1959] Reporting suggests, however, that there is an increasing number of queries from users who expect to hear product

information or to complete a transaction while interacting with a voice assistant.[1960] Amazon also justified the fact that third-party sales through Alexa are lower than third-party sales on Amazon.com—42% compared to 58%—by saying that "customers disproportionately use Alexa to order household consumable items (like paper towels or batteries) for which Amazon's offers are particularly competitive."[1961] This demonstrates the problem, however, given that voice shopping is most useful for products in which consumers do not have to do much research or engage in price comparison. Alexa's algorithm, in conjunction with the AmazonBasics business model, provides a convenient avenue for Amazon to favor first-party products.

Although it is technically possible for Alexa users to voice shop at other stores, there is significant friction. Users must first enable the shopping skills for other online retailers, which then requires the user to set up a completely separate billing profile, even though it contains similar information to their Amazon user profile. [1962] Alexa-enabled devices are tied to the user's Amazon account, which populates the user's saved credit card and shipping information for use during general shopping commands. [1963]

ii. Predatory Pricing and Bundling

Amazon uses a predatory pricing strategy to increase its sales of smart home devices by pricing its products below cost.[1964] It is common for Amazon to sell these products in bundles at steep discounts. Several smart home device manufacturers told the Subcommittee that when Amazon sells certain devices in a bundle or at a steep discount, it makes it nearly impossible for companies who specialize in making one piece of voice-assistant enabled hardware to compete on its merits.[1965] Furthermore, as described earlier in this Report, aggressive pricing of smart home devices—specifically "hubs" such as the Echo—has created a significant barrier to entry for companies that want to compete with the leading voice assistant platforms.

[1965] Competitors Hearing at 3–4 (statement of Patrick Spence, CEO, Sonos, Inc.).

iii. Use of Gatekeeper Power

Amazon Marketplace is an important distribution channel for voice-enabled electronics in its Alexa ecosystem. Amazon decides the availability and placement of products on its site. As a result, Amazon can use the threat of delisting a product on its marketplace to ensure that Alexa is enabled on other company's devices or to secure other favorable contractual terms.

In an interview with Subcommittee staff, a seller that sells a significant number of its device on Amazon.com said that during contract negotiations, Amazon repeatedly refers to its power to delist the company's product if Amazon's services are not prominent enough on the device.[1966] In 2017, Amazon also reportedly informed one of its main home security competitors—the Google-owned smart home company Nest—that it would not list any of its recently announced products, including its latest smart thermostat and home security system.[1967] Notwithstanding its own market power, Google's internal communications describe Amazon as having "changed the dynamics," observing that there is a "built in incentive to partner with Alexa, since [Amazon] will pull you from their store if you don't support it."[1968]

Additionally, Amazon controls the prominence of competing voice-enabled devices on its marketplace and promotes its first-party voice-enabled devices on Amazon.com. In an internal memorandum to Amazon executives about the Ring acquisition, Michael Deal, Amazon's Vice President and Associate General Counsel, said that Amazon "can promote Ring's products and subscription plans heavily on our sites as we do with our current [first-party] devices."[1969]

Relatedly, Amazon can also use advertisement placement as leverage during negotiations with other device manufacturers. In interviews with Subcommittee staff and submissions to the Subcommittee, several market participants said that ad placement was used as leverage in negotiations. In one instance, Amazon placed a competing brand's ad beneath the product of the firm it was negotiating with "to influence negotiations."[1970] Additionally, Subcommittee staff heard from a voice-enabled device manufacturer that offers a competitive product to Amazon's first-party devices that it was prohibited from buying ads on Amazon.com.[1971] The competitor expressed concern about the

harm this causes consumers, who may be confused or deceived when they receive ads promoting Amazon products even when they specifically search for a competitor's product on Amazon.com.[1972]

Even Google, which ranks just behind Amazon in online shopping queries, believes it has a disadvantage with Amazon. In an internal email about smart speakers, a Google employee noted that "fighting Amazon with a very-hard-to-differentiate product and a channel disadvantage and a huge economic disadvantage (due to channel mix margin differences) is already like fighting a shark on a surfboard."[1973]

iv. Misuse of Data

Amazon has access to information about consumer use of third-party applications on Alexa-enabled devices and uses its dominant position in the voice assistant market to collect more data from within the Alexa ecosystem.

Amazon has insight into which Alexa skills are invoked by Alexa users and the frequency of usage.[1974] Considering Amazon's use of third-party seller's data in e-commerce and cloud customer's data on Amazon Web Services, Amazon may use the same tactics with other firms' voice application data to determine which voice assistant skills it should invest in.

Additionally, Amazon uses its market power to collect third-party voice application data. According to a July 2020 report by the *Wall Street Journal*, Amazon told Vivint, a manufacturer of smart-home devices that, "it would only allow the company to remain on the Echo if Vivint agreed to give it not only the data from its Vivint function on Echo, but from every Vivint device in those customers' homes at all times."[1975]

Amazon has also faced civil suits related to its storage of voice data. [1976] When Alexa hears a "wake" word— such as "Alexa" or "Echo"—it records the user's voice command, including conversations in the background, and saves a permanent recording of the user's voice to its own servers, as opposed to temporary storage for artificial intelligence training purposes.[1977]

v. Copying Nascent Competitors Technology

The Subcommittee's investigation produced evidence consistent with public reporting that Amazon uses information collected through Alexa Fund investments to inform and improve Amazon's smart home ecosystem. When Amazon invests in a startup, it obtains access to the company's non-public financial information, strategic plans, and other proprietary information.[1978] According to a recent *Wall Street Journal* report, eight months after Alexa Fund invested in Nucleus, Amazon announced the Echo Show, a very similar Alexa-enabled video-chat device.[1979] This report described several other examples, including Vocalife, the inventors of a "speech-detection technology," which filed a lawsuit against Amazon alleging it improperly used proprietary technology.[1980] At the Subcommittee's sixth hearing, Representative Ken Buck (R-CO) said that allegations that Amazon incorporated features demonstrated to it by Vocalife's founders during an investment meeting "are serious, especially because the size and scope of these practices couldn't happen without Amazon's monopolistic control of the marketplace."[1981]

Prior to Amazon's acquisition of Ring, Amazon invested in Ring through the Alexa Fund, and internal emails about meetings during this time demonstrate how Amazon is able to obtain crucial insights into young companies. Amazon was able to learn about Ring's "roadmap, future products, [and] two acquisitions they have done."[1982] While Amazon often denies public reporting that it steals and copies technology from young startups, Amazon's emails suggest that it does replicate some of the startups it meets with or invests in. An email out of Amazon's Lab 126 regarding Ring indicated that Amazon "could easily replicate all of their hardware to be better, [and] operate in a more secure and robust infrastructure, for a LOT less than [the] cost of buying them."[1983] In the same email chain, Amazon employees wondered, "[I]f we move forward with due diligence, then decide not to buy [Ring], could we have legal issues if we go into the market by ourselves as a competitor and materially impact their business?"[1984]

5. Amazon Web Services

a. Overview

Amazon Web Services (AWS) is considered the pioneer of cloud computing and has sustained a first-mover advantage for over a decade.[1985] AWS officially launched in 2006, featuring two of its core IaaS offerings, Simple Storage Service (S3) and Elastic Compute Cloud (EC2).[1986] While Amazon.com was AWS's first customer, in the early 2000s AWS began creating cloud offerings for third-party merchants, who could use AWS to "build online shopping sites on top of Amazon's e-commerce engine."[1987] For AWS, meanwhile, this partnership with third parties gave the company experience in creating well-documented APIs for internal developers.[1988] Over the next few years, AWS rolled out additional programs to expand its network of third-party software vendors and implementation partners, including AWS Marketplace[1989] and the AWS Partnership Network (APN) in 2012.[1990]

Over the last decade, AWS has also secured significant government contracts. Most notably, in 2014, AWS signed a $600 million Commercial Cloud Services (C2S) contract to build the AWS Secret Region, a cloud offering tailored for the U.S. intelligence community.[1991] The deal marked the largest cloud infrastructure contract at the time and signaled the government's shift from investing in on-premise server capacity to cloud services.[1992] Today, AWS boasts work "with over 6,500 government agencies" and states that Amazon has been "among the first to solve government compliance challenges facing cloud computing," while also "consistently help[ing] our customers navigate procurement and policy issues related to adoption of cloud computing."[1993]

AWS contributes immense value to Amazon's overall business. In each quarter since Amazon began publicly reporting its financials for cloud, AWS has accounted for an outsized share of

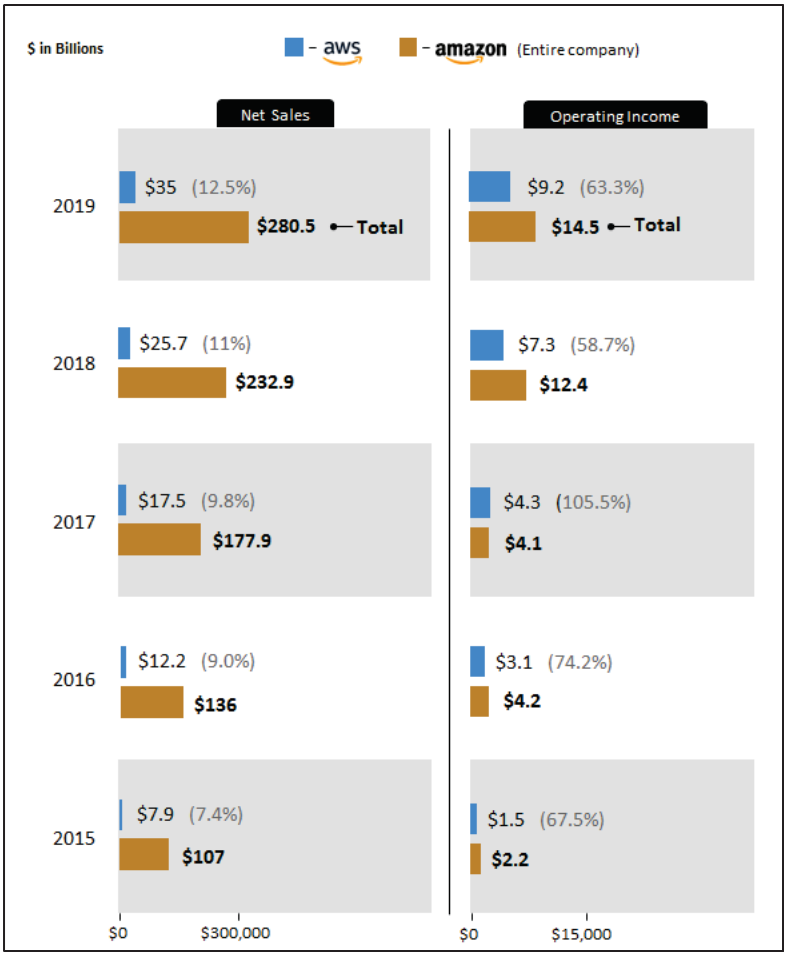
Amazon's operating profits. While AWS contributes to less than 15% of Amazon's annual revenue, it consistently accounts for over 50% of the company's operating income. In 2017, AWS accounted for over 100% of Amazon's operating income, due to losses in the company's international business.[1994] In the first quarter of 2020, AWS accounted for 13.5% of Amazon's total revenues but 77% of its operating income.[1995]

Contributions to Amazon's Revenue and Operating Profit over Time[1996]



Profits earned through its cloud services enable Amazon to invest heavily in expanding its cloud operation, as well as to support its other lines of business. Several market participants expressed concerns to Subcommittee staff that Amazon uses its high and steady profits from AWS to subsidize

1996 Prepared by the Subcomm. based on Amazon.com, Inc., Annual Report (Form 10-K) (2015–2019), https://www.sec.gov/Archives/edgar/data/1018724/000101872419000004/amzn-20181231x10k.htm these other lines of business, including its retail operation.[1997] In an internal document produced in response to the Committee's requests for information, Amazon instructs its employees to rebut this claim by referring to it as a "myth."[1998] However, Amazon failed to produce the financial data that would have enabled Subcommittee staff to make an independent assessment.[1999]

b. Market Power

As discussed earlier in this Report, AWS is the largest provider of cloud computing services, capturing approximately 24% of the U.S. spend in 2018 on cloud computing services, including IaaS, PaaS, and SaaS.[2000] AWS represents close to half of global spending on cloud infrastructure services, with three times the market share of Microsoft, its closest competitor.[2001] Its growth continues to soar. In the first quarter of 2020, AWS crossed $10 billion in quarterly revenue while growing 33% on an annualized basis.[2002]

Amazon has a "lion's share of the government cloud infrastructure market."[2003] Exact data on AWS's share of government cloud expenditure is opaque because most of AWS's public sector revenue comes through subcontracts, which are harder to track, and contracts related to the intelligence community, which are listed as classified spending and are rarely reported. Market participants, however, emphasize that AWS is considered a major player in federal cloud contracts.[2004]

In its submissions to the Subcommittee, Amazon describes itself as a relatively small player representing "less than 1% of IT spending globally and less than 2% in the United States."[2005] Amazon

AR_003609

states that AWS competes with a large array of offerings including on-premise computing.[2006] In other contexts, however, Amazon has highlighted its leading position, describing itself as the "largest cloud software marketplace" and the "only cloud provider with existing classified infrastructure."[2007]

Through a careful review of Amazon's internal documents and other evidence during the investigation, Subcommittee staff found that Amazon has a dominant position in cloud computing. Amazon's dominance in cloud computing traces in part to its first-mover advantage and the high fixed costs and economies of scale associated with this market.[2008] But evidence suggests that Amazon has also taken steps to lock in and extend this dominance in ways that risk harming customers, businesses, and the broader public.

Network effects incentivized Amazon to build out AWS offerings quickly. As with other sectors of the digital economy, the value of Amazon's cloud offerings increases with the number of businesses and customers that use it. Introducing more services and partnership programs draws more customers, attracts more developers and implementation partners, which, in turn, draws additional customers.[2009]

AWS is considered to have the largest collection of cloud offerings. Its AWS Management Console and supporting technologies span many categories, including storage and computing, databases, migration services, and machine learning tools.[2010] Many of these products are based on open-source software or on the technology of companies that Amazon acquired.[2011] In addition to selling cloud offerings directly, AWS also runs a cloud marketplace where third-party vendors can list their products. The AWS Marketplace enjoys over 1,300 vendors as of 2018, and over 9,000 products, functioning as the largest cloud marketplace in the sector.[2012]

The widespread adoption of AWS's developer certification programs, partner networks, and student programs has meant that there are far more engineers familiar with AWS technology than with any other platform.[2013] Several market participants listed the availability of AWS-trained engineers as a

[2013] Interview with Source 736 (June 10, 2020).

reason for selecting AWS over other cloud vendors and as a barrier for switching platforms or attempting to multi-cloud.[2014]

High switching costs reinforce Amazon's dominance in the cloud market.[2015] A cloud-based application company interviewed by Subcommittee staff explained these costs:

> We've looked at other services (Google, Microsoft, Oracle) but we've relied on AWS for so long that we couldn't just flip a switch, and we've run down a lot of engineering problems with AWS . . . There are other providers we could go to, but it would take work. We could also build some functionality internally, but that would also take a lot of work.[2016]

For cloud-based application developers, whose entire product is dependent on AWS, the fears of lock-in are even greater. One marketplace participant said:

> "[A]ny transition of the cloud services currently provided by AWS to another cloud service provider would be difficult to implement and would cause us to incur significant time and expense and could disrupt or degrade our ability to deliver our products and services. Our business relies on the availability of our services for [users] and advertisers.[2017]

Amazon has also taken steps to lock-in its position, including through long-term contracts, volume minimums, and the use of fees to move data to other cloud providers, which are also known as egress fees. In submissions to the Subcommittee, numerous market participants noted that AWS often seeks multi-year contracts during negotiations.[2018] These contracts are also commonplace in companies' investor statements. For example, according to Lyft's 2020 investor filing, they agreed to pay "an aggregate of at least $300 million between January 2019 and December 2021 on AWS services."[2019] According to Slack's investor filling, in 2018 it committed to a five-year contract with minimum annual commitments of $50 million.[2020]

[2020] Slack, Registration Statement (Form S-1) 90 (Apr. 26, 2019), http://d18rn0p25nwr6d.cloudfront.net/CIK-0001764925/b6da15ae-25c5-4447-ba38-c287bf11e624.pdf.

Subcommittee staff also uncovered evidence that Amazon sometimes requires a volume agreement when a large company seeks to negotiate lower prices. In an internal email discussion on this topic, a senior executive at AWS wrote that Amazon has "a private rate card which has a commit level for bandwidth pricing. Rates at or above the private rate card are pre-approved. Anything below that has to be first approved by me and then the price goes to service GM."[2021]

When an Amazon customer chooses to move data to another cloud provider, they are charged an egress fee. Market participants told Subcommittee staff that they view these fees less as a cost for Amazon to transport data and more as friction imposed by Amazon for switching providers, noting that Amazon charges egress fees even when data is staying locally within the same data center.[2022]

The COVID-19 pandemic has underscored the centrality of cloud computing to the functioning of an increasing swath of businesses—highlighting how cloud services have come to resemble critical infrastructure. Reporting by *The Information* in April 2020 discussed how the major cloud providers are facing requests from many customers for financial relief, while the demand for cloud computing has increased.[2023] As this reporting noted, "AWS has been the least willing to offer flexible terms on customer bills, according to numerous customers. That stands in contrast to Microsoft and Google which have shown some flexibility, partners say."[2024]

c. Merger Activity

Amazon has acquired a significant number of cloud computing firms over the past decade. Although a full discussion of this activity is beyond the scope of this Report, Amazon's acquisition activity in the cloud market appears to be part of a broader trend among dominant cloud providers to make serial acquisitions, any one of which may seem insignificant but which collectively serve to solidify and expand their dominance.[2025] In some instances AWS has acquired cloud technologies that previously integrated with multiple clouds, only for AWS to make it an AWS-specific product after acquisition, foreclosing competitors and increasing consumers' switching costs.[2026]

d. Competitive Significance of AWS to Amazon's Other Lines of Business

Amazon's dual role as a dominant provider of cloud infrastructure and as a dominant firm in other markets creates a conflict of interest that Amazon has the incentive and ability to exploit.

Amazon's dominance in cloud computing alongside its integration across an array of businesses—online retail, music and video, and smart home devices—creates a core conflict of interest. Cloud computing customers like Netflix and Target are in the position of competing with Amazon while also relying on AWS. Firms in their position effectively have to choose between switching to one of the alternative cloud infrastructure providers or funding their primary competitor.[2027] One venture capitalist described Amazon as "useful but dangerous" because "it's hard to predict what Amazon wants to get into . . . you can't know."[2028] Similarly, a business-to-business application developer told Subcommittee staff that they felt pressure to switch their entire product to Microsoft Azure because of its client's concerns with Amazon's anticompetitive conduct in the online retail sector.[2029]

Amazon acknowledges that its cloud customers which are also its competitors are wary of using AWS. One internal document had guidance on how to discuss the issue with customers. One FAQ sheet listed, "What do you say to customers who are worried that using AWS services will support Amazon's competitive growth in the retail space?" Amazon's sample answer stated, "How can you afford to not compete with the best possible tools in such a tough market like retail?"[2030]

Subcommittee staff also spoke with market participants that expressed concern about how this conflict of interest shapes Amazon's behavior in its other lines of business. For example, in 2015, Amazon kicked Google Chromecast and Apple TV—direct competitors with the Amazon Fire Stick and Fire TV cube—out of its retail store.[2031] AWS is also positioned to use customer and seller data from one line of business to inform decisions in other lines of business, analogous to its conduct in Amazon Retail. At least one market participant who spoke with Subcommittee staff had evidence that AWS engaged in this cross-business data sharing.[2032] In another internal document with guidance for staff on "AWS Competitive Messaging," employees were advised to offer the following response:

[2027] Christina Farr & Ari Levy, *Target Is Plotting a Big Move Away From AWS As Amazon Takes Over Retail*, CNBC (Aug. 29, 2017), https://www.cnbc.com/2017/08/29/target-is-moving-away-from-aws-after-amazon-bought-whole-foods.html); *See also Netflix on AWS,* AMAZON WEB SERVICE, https://aws.amazon.com/solutions/case-studies/netflix/ (last visited Sept. 30, 2020).

[2032] Interview with Source 126 (June 29, 2020).

> Q. Walmart is warning its suppliers that they don't want them to be running on AWS because they don't want Amazon.com, a competitor of Walmart's, to have access to their data. How are you addressing that?
>
> A: Even though Amazon's consumer business has no access to any customer data in AWS, I can understand why Walmart would be paranoid in making sure that their data is private. So, I think it's a pretty reasonable expectation for them to ask their suppliers to encrypt that data in AWS.[2033]

Engineers and market participants have also raised concerns that AWS employees may have access to Amazon's Key Management Services (KMS), which customers can use to store encryption keys.[2034] If an employee were able to access a customer's encryption keys, they could potentially see the contents of a customer's application, including proprietary code, business transactions, and data on their users. In response to questions from the Subcommittee, Amazon said that the company's "policies prohibit employees from accessing and reading customer keys in KMS. KMS is designed such that customer keys in the service cannot be retrieved in plain text (unencrypted) form by anybody, including AWS employees."[2035] Even if AWS employees can never access the content of their customers applications, AWS tracks a host of commercially sensitive metrics, including any changes in demand for storage and compute services, the components of their application's architecture, the requests to a specific database per second, database size, and the types of requests.[2036] One industry expert told Subcommittee staff:

> They don't need to see the encrypted content of a movie to see that there are a ton of requests to particular data. If Netflix announced five new movies this weekend and there's a ton of data to five new objects. So, you don't need all the information to know what's happening.[2037]

Finally, AWS provides Amazon with unparalleled insights into the trajectory of startups using its services, information that it can use to guide acquisitions and replicate promising technology. Data that AWS collects on cloud computing customers can provide unique business intelligence, information that investors, other firms, and entrepreneurs lack.

[2037] Interview with Source 146 (May 28, 2020).

A report from 2011 published in *Reuters,* profiling the AWS Start-up Challenge, describes cases where AWS has used insights gleaned from its cloud computing service to inform its venture capital investment decisions.[2038] Adam Selipsky, then Vice President of AWS, told *Reuters*, "AWS has great relationships with many young companies and there have been cases where we've been able to help with investment opportunities."[2039] Today, one way Amazon leverages AWS is through relationships with startups. The AWS Activate program provides startups with free credits, technical support, and training.[2040]

Subcommittee staff interviewed a startup and beneficiary of AWS Activate that had engaged in partnership conversations with Amazon. During these discussions, the startup shared information about how its product was built with AWS. Within a few years, the startup learned that Amazon had introduced a replica product. This company said that Amazon "had so many incentives. Rate cuts, and free services. Not having a lot of resources, it's hard to turn that down. But fast forward, we basically helped them build their offering that they copied from us."[2041]

As part of its investigation, the Subcommittee asked Amazon whether it uses or has ever used AWS usage patterns or data to inform its investment decisions. Amazon responded:

> AWS uses data on individual customers' use of AWS to provide or improve the AWS services and grow the business relationship with that customer. This data may inform AWS's decisions about how AWS invests in infrastructure, such as data centers, edge networks, hardware, and related software solutions in order improve the customer experience.[2042]

Amazon's response leaves unclear whether it would view it appropriate to use a firm's AWS data to develop products competing with that firm, so long as Amazon could identify some benefit to the broader "customer experience."

Prior to 2017, Amazon also required that AWS customers agree "not to assert any intellectual property claim against any AWS service used by that customer."[2043] Amazon removed that condition from the AWS online customer agreement on June 28, 2017.[2044]

In addition to creating a significant information advantage for Amazon, AWS may also reinforce its market power in other ways. Because startups often rely heavily on AWS, Amazon is a natural choice when pursuing a sale or seeking investment. In an internal email produced to the Subcommittee, Peter Krawiec, Amazon's Vice President of Worldwide Corporate Development, recapped a meeting with a recently acquired company, noting that the company was, "[s]uper excited about Amazon and relieved that Walmart will not be the buyer. Engineering team thrilled that they won't have to unplug from AWS under a Walmart world."[2045]

e. Conduct

The leading position AWS enjoys in the market traces in part to its first-mover advantage, network effects, and steep investments that the company made in building out the physical infrastructure on which cloud resides. However, AWS has also engaged in a series of business practices designed to maintain its market dominance at the expense of choice and innovation. Through a combination of self-preferencing, misappropriation, and degradation of interoperability, Amazon has sought to eliminate cross-platform products with Amazon-only products. Amazon's conduct has already led several open-source projects to become more closed, a move driven by a need for protection from Amazon's misappropriation. If unchecked, Amazon's tactics over the long-term risk solidifying lock-in and diminishing the incentive to invest. Because cloud is the core infrastructure on which the digital economy runs, ensuring its openness and competitiveness is paramount.

i. Misappropriation of Data

As described earlier in this Report, cloud platform vendors compete by expanding their first-party cloud offerings, such as those offered through the AWS Management Console.[2046] Market participants note that one way AWS has expanded its offerings is by creating proprietary versions of products that have been developed under open-source licenses.[2047]

Open-source licenses allow software to be freely used, modified, and shared.[2048] Open-source software can run on any infrastructure, local machine, server room, or on the cloud, reducing lock-in to a specific hardware vendor.[2049] Companies based on open-source software bring in revenue by selling

additional features under proprietary licenses or services.[2050] In recent years, open-source development has been a leading model for software development, attracting significant venture capital investment.[2051]

Market participants note that the rise of cloud computing services has led to a shift in the way open-source software is delivered and used. Many open-source software companies allowed engineers to download free versions of their software from their website, often without collecting any personal data about their users. As engineers outgrew the functionality of the free version, they would purchase more powerful versions.[2052] As cloud computing grew in popularity, open-source software vendors began offering versions of their software on the AWS Marketplace, where application developers could easily integrate the software. Market participants explain that AWS was able to use the data collected on their customers, including usage metrics, to learn which third-party software was performing well and ultimately to create their own proprietary version offered as a managed service. Creating a "knock-off" version of software was particularly easy when the product was using an open-source license, which provides more visibility to the underlying code.[2053]

In interviews with Subcommittee staff, market participants repeatedly said that AWS relied on innovations from open-source software communities to gain dominance. A venture capitalist told Subcommittee staff that "open-source is critical for AWS getting market power. They're standing on the shoulders of giants and they're not paying the giants."[2054] A long-time cloud vendor likewise said that "Amazon never built a database, never built cloud services, never built any of their AWS offerings. They took open source and offered it out on cloud. At the time that was innovative."[2055]

AWS has developed many of its offerings using this practice and has created products that are only accessible as first-party offerings through the AWS Management Console.[2056] An example frequently cited by market participants is Amazon Elasticsearch Service (AESS), a tool for searching and analyzing data, and a first-party product listed on the AWS Management Console.[2057] According to public reporting and interviews with market participants, this product is a copy of Elastic's,

Elasticsearch open-source product that was available for purchase on the AWS Marketplace.[2058] According to public reporting, within a year of introducing the product, Amazon was generating more money from its replica of Elasticsearch than Elasticsearch itself was generating. One key advantage that Amazon's "knock-off" had was that Amazon had given it superior placement in AWS Management Console.[2059] Additionally, as described in the *Elasticsearch vs Amazon* case, AWS can name their open-source "knock-off" products in a way that can mislead customers into believing that the "knock-off" product is sponsored by the open-source software vendor.[2060]

The Subcommittee's investigation uncovered evidence relating to numerous instances in which Amazon has offered proprietary managed services based on knock-offs of open-source code. One open-source market participant interviewed by Subcommittee staff said that because of this conduct, the benefits of open source "weren't accruing to [the] open-source community. People were feeling, we develop all this work and then some large company comes and monetizes that."[2061] MongoDB, a document-based database, has similarly commented that "once an open source project becomes interesting, it is too easy for large cloud vendors to capture all the value but contribute nothing back to the community."[2062]

When the Subcommittee inquired about this practice, Amazon responded, that "Projects where AWS has developed distributions on top of OSS [open-source software], like Open Distro for Elasticsearch and Amazon Corretto, add to, not supplant, the set of capabilities provided by the upstream open-source projects… it allows them to move between deploying OSS themselves and using managed services for open-source."[2063] Market participants told Subcommittee staff, however, that in the instances when AWS creates a "knock-off" version of an open-source software by adding "additional developments," those additional developments often only work with AWS infrastructure and are no-longer cross-platform—heightening the risk of lock-in.[2064] As one third-party explains, "So, the earlier benefits of open-source go out the window as Amazon takes over each of these product areas."[2065]

For example, while MongoDB is an open-source document-based database project, Amazon offers a proprietary product called Amazon DocumentDB. According to AWS, DocumentDB

implements the open-source MongoDB API and is designed to "emulate the responses that a MongoDB client expects from a MongoDB server."[2066] When a cloud customer chooses to build an application using DocumentDB they are tied to AWS's infrastructure. If they ever wanted to switch to another provider they would have to extensively re-engineer their product in another software, whereas, had they built their application using MongoDB—on AWS or any other cloud provider's infrastructure—their applications could move to other platforms.[2067]

ii. Harms to Innovation

Amazon's practice of offering managed service versions of open-source software has prompted open-source software companies to make defensive changes, such as closing off advanced features and changing their open-source license to be less permissive.[2068] One open-source vendor that recently started offering premium closed-sourced features said they were "paranoid" in light of Amazon cloning Elastic's features, noting that if this had happened to them they "would not have a business."[2069] Amazon's conduct has also reduced the availability of features in open-source software. Confluent,[2070] Redis Labs,[2071] and CochroachDB,[2072] along with several other open-source software vendors, have made similar license and business model changes, reducing the level of access to their software.[2073]

Market participants believe these changes significantly undermine innovation. Several noted that more closed-off licenses will result in fewer free, open-source features available to startups building prototypes and research labs that cannot afford access to paid features.[2074] Subcommittee staff also spoke with cloud computing customers in the public sector who worry about the changes and ambiguity in open-source licenses. One cloud computing customer told Subcommittee staff that three

pieces of open-source software that they use underwent license changes in the last year and that, due to strict "open source only" policies, they are "now stuck using older versions of the software [from] before the license change which requires additional work to improve the code base, implement the same functionality in-house or switch to a competitive product."[2075]

iii. Self-Preferencing

According to market participants, once a product—based on open source or otherwise—is available in the AWS Management Console, it becomes an easier choice for existing AWS customers relative to purchasing a managed service from a third-party vendor or self-managing open-source software. In an interview with Subcommittee staff, one startup said they purchased software services through the AWS Management Console as opposed to identical or nearly identical software from a third-party vendor because they were a small company and "instead of us managing everything, it was hit a button . . . they are all in one, it was easier."[2076] As with all cloud services offered through the AWS Management Console, customers benefit from a single sign-on with billing information already in place.[2077]

Market participants also note that Amazon makes certain functionality available to its first-party products that it doesn't make available to the companies managing the original version of the open-source software.[2078] For example, AWS services can run inside Amazon's Virtual Private Could (Amazon VPC) offering, which allows users to provision an "isolated section of the AWS Cloud," but third-party services cannot do so.[2079]

While Amazon failed to provide the Subcommittee with financial data identifying what AWS makes in revenue from individual cloud offerings, many marketplace participants believe that AWS makes more from managed versions of open-source software than the third-party vendors and managers of the software. In 2019, *The New York Times* reported that the Chief Executive of MariaDB, an open-source relational database company, estimated that "Amazon made five times more revenue from running MariaDB software than his company generated from all of its businesses."[2080] Market participants suggest this multiple of difference in income is likely for other AWS products based on open-source projects.[2081]

D. Apple

1. Overview

Apple was incorporated in 1977 and is headquartered in Cupertino, California.[2082] Apple was an early pioneer in designing and marketing mass-produced personal computers.[2083] Today, the company "designs, manufacturers, and markets smartphones, personal computers, tablets, wearables, and accessories, and sells a variety of related services."[2084] Apple's hardware products include the iPhone, iPad, Mac, Apple TV, and AirPods; its Services business segment includes the App Store, iCloud, AppleCare, Apple Arcade, Apple Music, Apple TV+, and other services and software applications.[2085] Apple tightly integrates its services and software applications with its products to ensure a seamless experience for consumers.[2086]

[2082] Apple Inc., Annual Report (Form 10-K) 1 (Sept. 28, 2019), https://s2.q4cdn.com/470004039/files/doc_financials/2019/ar/_10-K-2019-(As-Filed).pdf.

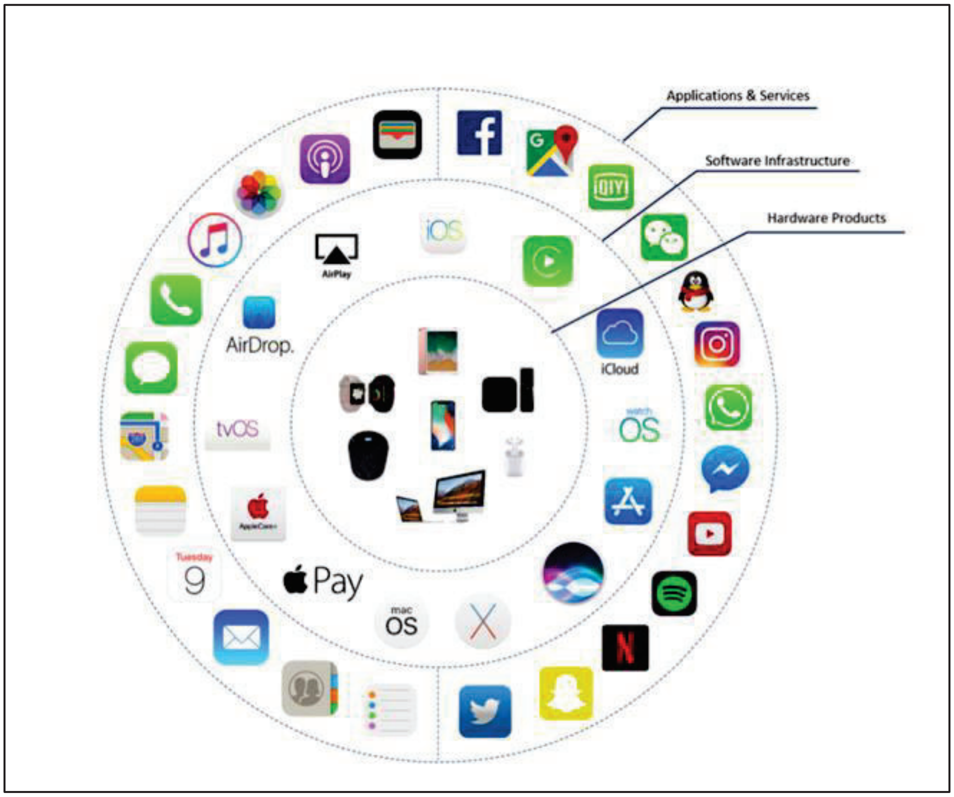
Apple's Ecosystem: Hardware, Software Infrastructure, Apple & Third-Party Apps[2087]



Apple reports financial information for two business categories: Products and Services.[2088] For Fiscal Year 2019, Apple reported total revenue of approximately $260 billion, down 2% from 2018, but up nearly 13.5% from 2017.[2089] Apple's margins totaled 37.8%, with profits of $98.3 billion.[2090] As of September 2020, Apple is the most valuable public company in the world and, in August 2020, became the first publicly traded U.S. firm to be valued at $2 trillion.[2091] Apple's stock rose by 60% in the first 8 months of 2020.[2092]

Apple is the leading smartphone vendor in the U.S., accounting for approximately 45% of the domestic market,[2093] with more than 100 million iPhone users nationwide.[2094] Apple's iOS is also one of two dominant mobile operating systems—the other operating system, Android, is discussed elsewhere in this Report. iOS runs on more than half of U.S. smartphones and tablets.[2095] Globally, Apple accounts for less than 20% of the smartphone market, and roughly 25% of smartphones and tablets run on iOS worldwide.[2096] In 2018, Apple sold its 2 billionth iOS device and is projected to sell its 2 billionth iPhone by 2021.[2097]

Apple also owns and operates the App Store for iOS devices. Launched in 2008, Apple highlights that the App Store allows app developers to reach consumers in 155 countries, and that more than 27 million app developers have published millions of apps in the App Store. Apple credits the App Store with creating 1.5 million jobs in the United States and more than $120 billion in worldwide revenue for app developers.[2098] According to Apple, the App Store ecosystem, including direct sales of apps, sales of goods and services inside of apps, and in-app advertising, facilitated more than $138 billion in economic activity in the U.S. last year.[2099]

[2099] Letter from Kyle Andeer, Vice Pres., Corp. Law and Chief Compliance Officer, Apple Inc., to Hon. Jerrold Nader, Chairman, H. Comm. on the Judiciary, Hon. Jim Jordan, Ranking Member, H. Comm. on the Judiciary, Hon. David N. Cicilline, Chairman, Subcomm. on Antitrust, Commercial and Admin. Law of the H. Comm. on the Judiciary & Hon. F.

In addition to the Subcommittee's investigation of Apple's market power and conduct, federal antitrust authorities are investigating the company for potential violations of the U.S. antitrust laws. In June 2019, *The New York Times* and the *Wall Street Journal* reported that the Justice Department had opened investigations into potential violations of the antitrust laws by Apple.[2100] Apple is also under investigation by multiple international competition authorities for antitrust violations and anticompetitive practices,[2101] in addition to facing private antitrust lawsuits in the U.S.[2102]

Previously, the Justice Department and Attorneys General of 33 states sued Apple for orchestrating a conspiracy to fix prices in the eBooks market in 2012.[2103] Apple was found to have violated state and federal antitrust laws and was forced to pay $450 million.[2104] In 2010, Apple settled an antitrust complaint with the Department of Justice that it conspired with several other technology

companies to eliminate competition in hiring for employees.[2105] It later entered into a $415 million joint settlement agreement in a class-action lawsuit by affected employees.[2106]

2. iOS and the App Store

a. Market Power

Apple has significant and durable market power in the market for mobile operating systems and mobile app stores, both of which are highly concentrated.[2107] Apple's iOS mobile operating system is one of two dominant mobile operating systems, along with Google's Android, in the U.S. and globally.[2108] Apple installs iOS on all Apple mobile devices and does not license iOS to other mobile device manufacturers. More than half of mobile devices in the U.S. run on iOS or iPadOS, an iOS derivation for tablets introduced in 2019.[2109] Apple's market power is durable due to high switching costs, ecosystem lock-in, and brand loyalty. It is unlikely that there will be successful market entry to contest the dominance of iOS and Android.

As a result, Apple's control over iOS provides it with gatekeeper power over software distribution on iOS devices. Consequently, it has a dominant position in the mobile app store market and monopoly power over distribution of software applications on iOS devices.[2110]

[2107] *See* Stigler Report at 78 ("[T]he evidence thus far does suggest that current digital platforms face very little threat of entry. … [T]he key players in this industry remained the same over the last two technology waves, staying dominant through the shift to mobile and the rise of AI. In the past, dominant businesses found it difficult to navigate innovation or disruption waves. By contrast, Facebook, Google, Amazon, Apple, and even Microsoft were able to ride these waves without significant impact on market share or profit margins. This indirect evidence corroborates the argument that these companies are facing few competitive threats.").

[2110] *See infra* Section IV.

Apple's App Store is the only method to distribute software applications on iOS devices.[2111] It does not permit installation of alternative app stores on iOS devices, nor does it permit apps to be sideloaded. As discussed earlier in this Report, consumers have a strong preference for native apps to web apps,[2112] and Apple has acknowledged key differences between them. Developers have explained that Apple actively undermines the open web's progress on iOS "to push developers toward building native apps on iOS rather than using web technologies."[2113] As a result, Apple's position as the sole app store on iOS devices is unassailable. Apple fully controls how software can be installed on iOS devices, and CEO Tim Cook has explained that the company has no plan to permit an alternative app store.[2114] The former director of the app review team for the App Store observed that Apple is "not subject to any meaningful competitive constraint from alternative distribution channels."[2115]

In response to these concerns, Apple has not produced any evidence that the App Store is not the sole means of distributing apps on iOS devices and that it does not exert monopoly power over app distribution. Apple says it does not create—nor is it aware of third-party data—that tracks market share in the app distribution market.[2116] Apple claims the App Store competes in a larger software distribution market that includes other mobile app stores as well as the open internet, personal computers, gaming consoles, smart TVs, and online and brick-and-mortar retail stores.[2117] While consumers can access software and developers can distribute software through those platforms, none of those platforms permit consumers to access apps on an iOS device or developers to distribute apps to iOS devices.

Apple's monopoly power over software distribution on iOS devices appears to allow it to generate supranormal profits from the App Store and its Services business. Apple CEO Tim Cook set a goal in 2017 to rapidly double the size of the Services business by the end of 2020.[2118] Apple met this goal by July 2020, six months ahead of schedule.[2119] The Services business accounted for nearly 18%

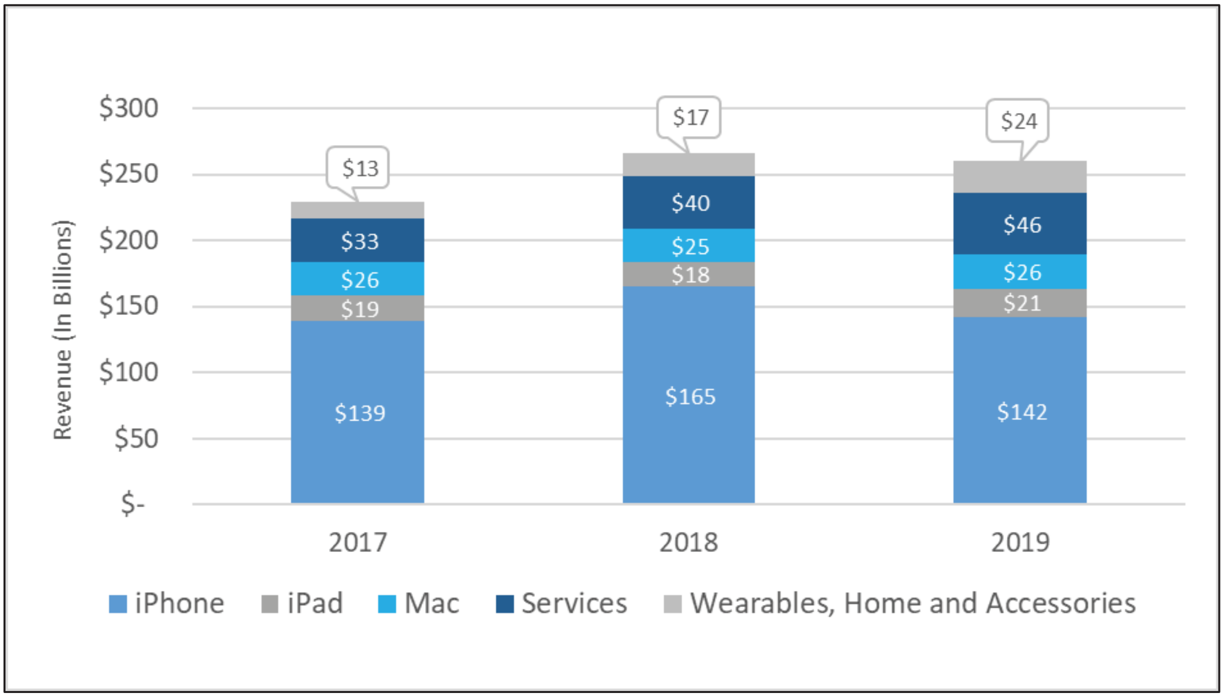
of total revenue in Fiscal Year 2019, about $46.2 billion. Services grew faster than Products in recent years, increasing by more than 41% since 2017.[2120] The Services category is also Apple's highest margin business at 63.7% in Fiscal Year 2019 and 67.2% for the quarter ending in June 2020.[2121]

Annual Revenue by Segment[2122]



Industry observers credit Apple's successful focus on growing the Services business with its rising valuation and future long-term.[2123] Apple has attributed the growth of Services as a driver of the firm's profits from sales and an important factor supporting Apple's overall margins as hardware sales

slowed or declined.[2124] The company has consistently credited the App Store, licensing sales, and AppleCare for the success of Services.[2125]

b. Merger Activity

In 2019, Apple CEO Tim Cook told CNBC that Apple buys a new company every 2 to 3 weeks, focusing on acquiring "talent and intellectual property."[2126] In July 2020, Mr. Cook explained that Apple's "approach on acquisitions has been to buy companies where we have challenges, and IP, and then make them a feature of the phone."[2127] An Apple submission to the Subcommittee explains that it:

> [H]as not embarked on a strategy of acquiring nascent competitors in service of its growth and market position. Instead, Apple's acquisitions generally are meant to complement its product business by accelerating innovation and building out new features and technologies for Apple's hardware and software offerings.[2128]

In 2020, Apple continued acquiring small firms, including artificial intelligence and virtual reality startups, an enterprise software maker, a contactless payment startup, and a weather application,

among others.[2129] One of Apple's largest transactions occurred in 2019 when it paid $1 billion to acquire Intel's smartphone modem business.[2130]

Apple has also recently acquired software companies to create a foundation from which it could launch new apps. For example, after purchasing the digital magazine subscription service Texture in 2018, Apple integrated most of Texture's functionality into its own Apple News+ service, which debuted the following year.[2131] Similarly, one of Apple's largest purchases to date—its $3 billion acquisition of Beats Electronics in 2014—was instrumental to the 2015 launch of Apple Music.[2132] Apple sought to grow Apple Music quickly after its introduction. Apple pre-installed the service on iPhones and made it the only music service accessible through Siri, Apple's virtual assistant. Apple also offered Apple Music with a free month trial period and made it available on Android devices. The strategy saw Apple gain 10 million paying subscribers within six months.[2133] Apple supplemented its music services business in 2018 by acquiring the music recognition app Shazam, and most recently, by acquiring podcast app Scout FM in 2020.[2134]

It is common for Apple to integrate apps it purchases into its own pre-existing apps or into the iOS mobile operating system. Examples of this include the 2014 acquisition of Swell, a podcast app, and the 2013 acquisition of HopStop, a transit navigation app.[2135]

Apple has followed a similar strategy for integrating the Dark Sky weather app. Apple shut down Dark Sky's Android app in August 2020 and plans to integrate the app's features with the iPhone's Weather widget on iOS 14.[2136] In addition to its app, Dark Sky supplied data to independent weather apps, like Carrot, Weather Line, and Partly Sunny. As a result of Apple's takeover of Dark Sky, independent weather apps will lose access to the inexpensive, hyper-local weather data that Dark Sky supplied, leading some weather apps to shut down and others to rely on higher-priced suppliers for forecast data.[2137]

c. Conduct

i. Commissions and In-App Purchases

The Committee sought information regarding Apple's policy of collecting commissions from apps sold through the App Store and purchases made in iOS apps. Apple charges a 30% commission on paid apps—those that charge a fee for users to download—downloaded from the App Store. It also takes a 30% fee for in-app purchases (IAP) of "digital goods and services."[2138] For app subscriptions, Apple charges a 30% commission for the first year and a 15% commission for subsequent years.[2139] Apps are not permitted to communicate with iOS users that the app may be available for purchase at a lower price outside the App Store, provide links outside of the app that may lead users to find alternative subscription and payment methods, or offer their own payment processing mechanism in the app to avoid using Apple's IAP.[2140] Apps that violate Apple's policies can be removed from the App Store, losing access to the only means of distributing apps to consumers with iOS devices.[2141]

Apple describes its policies as standard industry practice and says that other app stores charge the same fees.[2142] In 2020, Apple funded a study that concluded that other software distribution platforms run by Google, Amazon, Samsung, Microsoft, and others charge identical or similar commissions on software downloads and transactions, and that commissions are common in other digital markets.[2143] Apple also highlighted that its commissions are lower than the cost of software distribution by brick-and-mortar retailers, which dominated the marketplace prior to the introduction of the App Store.[2144] The Apple-commissioned study explained Apple funds the App Store through a $99 annual fee it charges to developers and $299 for developers building enterprise apps, as well as the commission and fees collected on apps and in-app purchases.[2145]

Apple also noted that 84% of all apps distributed through the App Store pay no commissions or fees.[2146] Apple does not take a commission on purchases from apps like Uber or Etsy that sell "physical goods or services that will be consumed outside the app."[2147] Apple also makes some exceptions to its rules and may change or update its rules.[2148] For example, Apple has an exception for "Reader" apps such as Netflix and Kindle that permit users to access content purchased outside the

app, but do not allow for in-app subscriptions or purchases.[2149] Apple also makes exceptions for "third-party premium video apps" that integrate with Apple TV and other Apple services.[2150] Mr. Cook explained, "[t]oday, there are over 130 apps that participate in this program," and "[t]he reduced 15% commission is available to all developers offering premium video content on the same terms as Amazon Prime Video, with the same qualification criteria."[2151] Amazon Prime Video, Altice One, and Canal+ have been publicly confirmed as participants.[2152]

During the investigation, the Subcommittee received evidence from app developers regarding Apple's commissions and fees for IAPs. ProtonMail, a secure email provider, explained that Apple's justification of its 30% commission overlooks the dynamics of the marketplace for distributing software to consumers with iOS devices—conflating practices that may be unremarkable in competitive markets but abusive in monopoly markets.[2153]

For example, personal computer (PC) users can install software from app stores run by Microsoft, Google, Amazon, and others or download software directly from the software developer's website and bypass app stores altogether. Similarly, Apple's Mac App Store is one of many options for Mac users to download software. While Samsung is a global leader in smartphones, the Samsung Galaxy Store is one of several app stores available on Samsung's mobile devices. Google's Play Store dominates app distribution on Android devices and is the most apt comparison to the App Store, but Google permits some competition via sideloading and alternative app stores.[2154]

In contrast, Apple owns the iOS operating system as well as the only means to distribute software on iOS devices. Using its role as an operating system provider, Apple prohibits alternatives to the App Store and charges fees and commissions for some categories of apps to reach customers. It responds to attempts to circumvent its fees and commissions with removal from the App Store.[2155] Because of this policy, developers have no other option than to play by Apple's rules to reach customers who own iOS devices. Owners of iOS devices have no alternative means to install apps on

their phones. Apple notes that its 30% commission has remained static for most apps for more than a decade.[2156] A group of developers that filed a lawsuit against Apple challenging this policy argue that the persistence of Apple's 30% rate over time, "despite the inevitable accrual of experience and economies of scale," indicates there is insufficient competition.[2157] Additionally, as previously noted, there is little likelihood for new market entry in the mobile operating system or mobile app store markets to compel Apple to lower its rates.[2158]

Industry observers have also challenged Apple's implicit claim that the iPhone was the start of the online software distribution market. For example, Mac and iOS developer Brent Simmons remarked that "when the App Store was created, developers were selling and distributing apps over the web, and it worked wonderfully," noting that he began distributing software over the internet in the 1990s.[2159] Software designer and technology writer John Gruber agreed, explaining that in the mid-1990s there was "a thriving market for software sold directly over a thing called 'The Internet,'" and that Apple's omission of the fact that "direct downloads and sales over the web" pre-dated the iPhone by more than a decade "is flat-out dishonest."[2160]

Many developers have stressed that, because Apple dictates that the App Store is the only way to install software on iOS devices and requires apps offering "digital goods and services" to implement the IAP mechanism, Apple has illegally tied IAP to the App Store.[2161] Consumers with iOS devices account for a disproportionately high amount of spending on apps—spending twice as much as Android users.[2162] Further, iOS users seldom switch to Android.[2163] Thus, developers cannot abandon

As a result, developers say that Apple abuses control over its valuable user base by prohibiting alternative payment processing options to compete with Apple's IAP mechanism.

Developers further argue that Apple's 30% commission from IAP is a "payment processing" fee and not a distribution fee.[2164] In a submission to the Committee, Match Group said, "Apple distorts competition in payment processing by making access to its App Store conditional on the use of IAP for in-app purchases, thus excluding alternative payment processors. IAP eventually becomes the vessel through which Apple extracts its extraordinary commissions."[2165] Two app developers that offer services that compete with Apple explained that IAP is a payment processing fee and not a distribution fee. Both pointed out that Apple does not charge apps for distribution, evidenced by the fact Apple admits distributing most apps for free. Instead, Apple generates revenue by adding a 30% processing fee on transactions in the App Store and using IAP.[2166] Apple's Developer Program website explains that Apple does charge for distribution—it requires enrollment in the Apple Developer Program and payment of a $99 fee to distribute apps on the App Store.[2167]

Apple responded that its "commission is not a payment processing fee" and that it "reflects the value of the App Store as a channel for the distribution of developers' apps and the cost of many services" it incurs to maintain the App Store.[2168] It said that "[t]he commission also enables Apple to

realize a return on its investment in the App Store and in Apple's intellectual property, and to fund future App Store innovation."[2169] Similarly, a study commissioned by Apple in 2020 explained that the annual fees paid by developers, commissions, and charges for in-app purchases fund investments in the App Store ecosystem, such as app review, developer tools, marketing, search functionality, application program interfaces, and software development kits.[2170] Apple has also argued that its App Store Developer Guidelines—including its requirement to use Apple's in-app purchase mechanism—is "designed to keep the store safe for our users."[2171]

Apple's rationale for its commissions and fees has evolved over time. Its recent explanations of the basis for its 30% commission differs significantly from its explanation of its fee and revenue expectations in the early years of the App Store. Prior to the App Store's debut in 2008, then-Apple CEO Steve Jobs explained, "We don't intend to make any money off the App Store . . . . We're basically giving all the money to the developers and the 30 percent that pays for running the store, that'll be great."[2172] In 2011, Apple's Chief Financial Officer Peter Oppenheimer explained to Apple's shareholders that Apple runs the App Store "just a little over break even."[2173]

Apple's financial reports indicate that the App Store is faring far better than the modest business Apple originally contemplated. According to a 2019 market analysis, Apple's net revenue from the App Store is projected to be $17.4 billion for Fiscal Year 2020.[2174] CNBC estimated the App Store had total sales of nearly $50 billion in 2019, generating "about $15 billion in revenue for Apple."

With $50 billion in annual sales, CNBC explained, "the App Store alone would be no. 64 on the Fortune 500, ahead of Cisco and behind Morgan Stanley."[2175] An analytics firm concluded that Apple likely made $15.5 billion from the App Store in 2018, and estimated $18.8 billion for 2022. *Bloomberg* reported that analysts forecasting Apple's third-quarter 2020 performance predicted growth from Services "up 15% from a year earlier," and that growth would largely be attributable to the App Store and licensing, not new services.[2176] In addition to Apple's commissions and fees for IAP, App Store revenue also includes $2.67 billion Apple would make through the $99 annual fee paid by Apple's 27 million iOS developers.[2177] Apple also reportedly made $9 billion in 2018 and $12 billion in 2019 to set Google as the default search engine on the Safari browser.[2178] Revenue from setting Google as Safari's default search engine is attributed to Apple's Services business, which is the business unit that includes the App Store.[2179]

In an interview with Subcommittee staff, Phillip Shoemaker, Apple's former Senior Director of App Store Review, estimated that Apple's costs for running the App Store are less than $100 million. Other analysts estimate that the App Store has significantly higher profits. A gaming developer explained that the fees it pays Apple's add up to millions of dollars—or even tens or hundreds of millions of dollars for some developers—far in excess of the developer's estimate of Apple's costs of reviewing and hosting those apps.[2180] Although only estimates, these figures indicate that as the mobile app economy has grown, Apple's monopoly power over app distribution on iPhones permits the App Store to generate supra-normal profits. These profits are derived by extracting rents from developers, who either pass on price increases to consumers or reduce investments in innovative new services. Apple's ban on rival app stores and alternative payment processing locks out competition, boosting Apple's profits from a captured ecosystem of developers and consumers.[2181]

[2180] Interview with Source 143 (Aug. 27, 2020).

[2181] Dr. Carl Shapiro of the University of California, Berkeley—the former top economist for the Justice Department's Antitrust Division during the Obama Administration—has noted that persistently high corporate profits that are not eroded by competitive forces over time are an indicator of market power. It also suggests the rise of incumbency rents, or the earning of excess profits "by firms whose positions are protected by high barriers to entry." Carl Shapiro, *Antitrust in a*

To address this concern without compromising the security or quality of the App Store, some developers argue in favor of allowing third-party payment processors like PayPal, Square, and Stripe to compete in the App Store. They explain that the most likely competitors are already trusted and widely used for e-commerce transactions.[2182] David Heinemeier Hansson, Cofounder and CTO of Basecamp, testified at the Subcommittee's fifth hearing that Apple's market power allows it to keep fees "exorbitantly high."[2183] By comparison, he noted that other markets, such as credit card processes, are "only able to sustain a 2 percent fee for merchants. Apple, along with Google, has been able to charge an outrageous 30 percent for years on end."[2184] Several other firms observed that Apple's control over app distribution allows it to extract high fees on a minority of apps, and that competition for processing payments would drive prices down. For example, developers explain that payment processing typically costs less than 5% of the transaction value.[2185] Before the App Store, one developer reportedly explained that "[w]e typically paid about 5%—not 30%—to a payment processor," and it "worked just as well for small developers as for large."[2186]

Other developers have noted that alternative payment processing providers charge significantly lower rates than Apple's fee for IAP. Match Group estimates that Apple's expenses related to payment processing "justify charging no more than 3.65% of revenue."[2187] Some app developers would prefer to implement in-house payment processing. In August 2020, Epic Games introduced a direct payment option in its Fortnite app, allowing gamers to elect to use Apple's IAP or pay Epic directly. Epic's payment processing option that charged consumers 10%—a 20% discount from purchases using IAP.[2188] In response, Apple disabled updates for Fortnite for violating the App Store Guidelines.[2189]

Developers have also detailed that Apple attempts to lock in its fees by preventing apps from communicating with customers about alternatives. Under the App Store Guidelines, apps may not provide any information "that direct[s] customers to purchasing mechanisms other than in-app purchase."[2190] They also cannot communicate with iOS app customers about purchasing methods other than IAP.[2191]

In an interview with Subcommittee staff, one developer that offers a "freemium" app—a popular business model where the app is available for free but users can purchase upgrades—recalled that it sent an email to customers with iOS devices with information about how to upgrade to a paid subscription, including a link to the service's website where customers could upgrade their subscription. Apple responded by threatening to remove the app from the App Store and blocked its updates, including security patches.[2192] A game developer described Apple's rules as reaching outside the App Store itself to police the communications that an app can have with its own customers, including communications intended to improve customer experience and offer discounts.[2193]

In his questions for the record for the Subcommittee's second hearing, Representative W. Gregory Steube (R-FL) asked Apple about banning communications to customers by app providers. Apple responded that its restrictions on communications between apps and customers are to ensure Apple can collect commissions and "prevent free-riding."[2194] Apple explained that it restricts developers from using the iOS ecosystem to "direct customers they have acquired through Apple to purchase content elsewhere for the purpose of avoiding Apple's rightful commission."[2195] The company described its policy as a prohibition "on developers promoting, via the App Store, transactions outside the App Store," and said Apple's policies were no different than most other retailers.[2196]

In June 2020, the European Commission announced that it had opened a formal antitrust investigation of Apple's App Store rules and conduct, including "the mandatory use of Apple's own

proprietary in-app purchase system and restrictions on the availability of developers to inform iPhone and iPad users of alternative cheaper purchasing possibilities outside of apps."[2197]

As Apple has emphasized growing its Services business, app developers and technology writers have observed Apple is increasingly insistent that apps implement IAP—cutting Apple in on revenue from more developers—and threatening apps that do not comply with expulsion from the App Store.[2198] In June 2020, HEY, an email app developed by Basecamp, was approved by the App Store and then abruptly told it would have to implement Apple in-app purchasing or face removal from the platform.[2199] While HEY's app updates were eventually allowed, Apple did force it to create a free trial option for iOS customers.[2200] Basecamp Cofounder and CTO David Heinemeier Hansson observed that Apple threatened and abused small app developers for years, and that the conflict with HEY amounted to a "shakedown."[2201] In August 2020, Apple denied WordPress the ability to update its app unless it implemented IAP, even though the WordPress app does not sell anything. Apple ultimately backed off its demands only after the issue received negative attention on social media.[2202] ProtonMail told the Subcommittee that its privacy-focused email app competes with an Apple's email app, and after being in the App Store for two years, Apple demanded the ProtonMail implement IAP or be removed from the App Store. ProtonMail complied to avoid damage to its business.[2203]

Internal Apple communications reviewed by Subcommittee staff indicate that Apple has leveraged its power over the App Store to require developers to implement IAP or risk being thrown

out of the App Store.[2204] Then-Apple CEO Steve Jobs once explained, "there will be some roadkill because of it. I don't feel guilty" when confronted with developer complaints about Apple's commission and requirement to use IAP.[2205] The Netherlands Authority for Consumers and Markets has noted that some app developers attribute Apple's inconsistent application of its rules to inattention to apps that are infrequently updated, and that Apple likely focuses on requiring IAP for high revenue-generating apps.[2206]

In response to the COVID-19 pandemic, some businesses moved physical events online, often booking through an app and holding the event through a video chat application. Educators have also shifted resources online, including through apps. *The New York Times* reported that Apple demanded a 30% commission from these virtual class offerings. As a result, one company stopped offering virtual classes to users of its iOS app. The *Times* reported that Apple threatened Airbnb that it would remove its app from the App Store if Airbnb did not comply with Apple's demand for a share of its revenues.[2207]

In interviews with Subcommittee staff, multiple app developers confirmed *The New York Times*' reporting.[2208] Airbnb spoke with Subcommittee staff and described conversations with the App Store team in which Apple said it had observed an uptick in the number of apps offering virtual classes in lieu of in-person classes due to the COVID-19 pandemic. As a result, Apple began canvassing the App Store to require app developers implement IAP, entitling Apple to take 30% of in-app sales. Airbnb explained that Apple's commission, plus compliance with Apple's pricing tiers for in-app purchases would ultimately result in a 50-60% price increase for consumers.[2209]

Technology industry observers have reported similar conduct. On June 17, 2020, Ben Thompson, a prominent business analyst, wrote that app developers told him that Apple was demanding 30% commissions from businesses that have had to change their business models from live, in-person events to virtual events as a result of the COVID-19 pandemic. Mr. Thompson quoted one developer who explained that Apple was taking advantage of small businesses in the midst of the ongoing public health crisis.[2210]

At the Subcommittee's sixth hearing, Chairman Jerrold Nadler (D-NY) asked Mr. Cook about the allegations that Apple was canvassing the App Store to extract commissions from businesses that have been forced to change their business model in order to survive during the pandemic. Mr. Cook responded that Apple "would never take advantage" of the pandemic, but justified the conduct, explaining that the app developers were now offering what Apple defined as a "digital service" and Apple was entitled to commissions.[2211] Responding to *The New York Times'* reporting on the matter, Apple defended its conduct, explaining that "[t]o ensure every developer can create and grow a successful business, Apple maintains a clear, consistent set of guidelines that apply equally to everyone."[2212]

App developers affected by these changes said that after Apple's conduct became public it created an exception to its policies until the end of 2020. However, on January 1, 2021, those businesses will be required to implement IAP or remove the ability to book virtual classes in their apps.[2213]

Developers have submitted evidence that Apple's commissions and fees, combined with the lack of competitive alternatives to the App Store and IAP, harm competition and consumers. For instance, Match Group called Apple's fee for IAP "unreasonable," saying that it leads to higher prices for consumers and "an inferior user experience and a reduction of innovation."[2214]

One developer that offers an app that directly competes with Apple told the Subcommittee it was forced to raise prices to pay Apple's commission. As a result, it was less competitive, and fewer iOS users purchased its service. The company said that because apps often have small margins, they cannot absorb Apple's fees, so the price consumers pay for its app is more than 25% higher than it would otherwise be.[2215] Small developers described Apple's 30% cut as "onerous."[2216] Epic Games, which recently filed an antitrust complaint against Apple, has told a federal court that Apple's fees and commissions force developers "to increase the prices they charge in order to pay Apple's app tax. There is no method app developers can use to avoid this tax."[2217] Mac and iOS app developer Brent

2217 Complaint at 3, Epic Games, Inc. v. Apple Inc., 4:20-cv-05640 (N.D. Cal., Aug. 13, 2020), https://cdn2.unrealengine.com/apple-complaint-734589783.pdf.

Simmons explained Apple's fees reduce innovation and lead to fewer apps in the marketplace, observing:

> [T]he more money Apple takes from developers, the fewer resources developers have. When developers have to cut costs, they stop updating apps, skimp on customer support, put off hiring a graphic designer, etc. They decide not to make apps at all that they might have made were it easier to be profitable.[2218]

In Apple's internal documents and communications, the company's senior executives previously acknowledged that the IAP requirement would stifle competition and limit the apps available to Apple's customers. For example, in an email conversation with other senior leaders at Apple about whether to require IAP for e-Book purchases, then-CEO Steve Jobs concluded, "I think this is all pretty simple—iBooks is going to be the only bookstore on iOS devices. We need to hold our heads high. One can read books bought elsewhere, just not buy/rent/subscribe from iOS without paying us, which we acknowledge is prohibitive for many things."[2219]

International competition authorities have also examined the competitive effects of Apple's App Store commissions and fees. The Australian Competition and Consumer Commission (ACCC) observed that Apple's control over app distribution on iOS devices gives it leverage to extract commissions from apps, reducing the revenue that app providers like media businesses can invest in content.[2220] The Netherlands Authority for Consumers and Markets, which completed a comprehensive study of mobile app stores in 2019, noted that developers have increased prices to account for commissions and fees.[2221] The study also remarked that Apple's 30% commission on in-app purchases may distort competition because Apple's requirement to use IAP often applies to apps competing directly against Apple's apps. As a result, app developers with small margins cannot simply absorb the cost of Apple's commission, so they increase their price, which gives Apple's competing service an advantage.[2222] Developers cited in the study "mentioned that it is highly unlikely that it is a coincidence that these digital services that are required to use IAP face competition from Apple's own apps, or possibly will do in the future."[2223]

ii. Pre-Installed Apps, Default Settings, Private App Programming Interfaces (APIs), and Device Functionality

In addition to investigating whether Apple abuses its monopoly power over app distribution to leverage high commissions and fees from app developers, the Subcommittee also examined whether Apple abuses its role as the owner of iOS and the App Store to preference its own apps or harm rivals. The Committee requested information regarding Apple's practice of locking-in Apple's apps as defaults on the iPhone, and Subcommittee Chairman David N. Cicilline (D-RI) requested information from Apple regarding its practice of pre-installing its own apps on the iPhone. Subcommittee Chairman Cicilline also asked whether Apple's policy of reserving certain application programming interfaces (APIs) and access to certain device functionalities for its apps gives Apple's services a competitive advantage.

It is widely understood that consumers usually do not change default options.[2224] This is the case "even if they can freely change them or choose a competitive alternative."[2225] Subcommittee staff reviewed communications between Apple employees that demonstrate an internal understanding that pre-loading apps could be advantageous when competing against third-party apps.[2226]

Apple pre-installs about 40 Apple apps into current iPhone models.[2227] Several of these apps are set as defaults and are "operating system apps" that are "integrated into the phone's core operating system and part of the combined experience of iOS and iPhone."[2228] According to Apple, users can delete most of these pre-installed apps.[2229] Apple does not pre-install any third-party apps, and until the September 2020 release of iOS 14, it did not allow consumers to select third-party web browsers or email apps as defaults.[2230] Apple says that it is making "more than 250,000 APIs available to developers in iOS 14."[2231]

[2224] *See e.g.,* Dig. Competition Expert Panel Report at 36 ("[C]onsumers in digital markets display strong preferences for default options and loyalty to brands they know."); Stigler Report at 8, 41 ("Consumers do not replace the default apps on their phones… and take other actions that may look like poor decisions if those consumers like to choose among options and experience competition.").

AR_003643

The Netherlands Authority for Consumers and Markets report on mobile app stores observed that app providers believe they "have a strong disadvantage" when competing with Apple's apps due to the fact that those services are often pre-installed on iOS devices.[2232] The study also noted that "pre-installation of apps can create a so-called status-quo bias. Consumers are more likely to use the apps that are pre-installed on their smartphones."[2233] Consumers will download apps that compete with pre-installed apps only when there is a noted quality difference, and even then, lower-quality pre-installed apps will still enjoy an advantage over third-party apps.[2234] The European Commission's 2019 report on competition in digital markets explained that privileging access to APIs can provide an advantage to those with greater access over those with more innovative products.[2235] Public Knowledge concluded that Apple's control of iOS and the App store enables it to advantage its own apps and services by pre-installing them on iOS devices, leading consumers to rely on the pre-installed apps rather than looking for alternatives in the App Store.[2236]

Mobile operating system providers develop APIs to permit apps to access a device's features, such as the microphone, camera, or GPS, or other software programs, and determine what information on the device apps can access.[2237] Public APIs for iOS are made available to app developers to ensure apps are integrated with the device and function as intended. These public APIs also control the services that are opened via default when users click a link to open a webpage or an address to open a map application. Private APIs access functionality that is not publicly released. Apple is permitted to use private APIs on iOS devices, but third-party developers are not.[2238]

Apple's public APIs default to Apple's pre-installed applications. As a result, when an iPhone user clicks on a link, the webpage opens in the Safari Browser, a song request opens in Apple Music, and clicking on an address launches Apple Maps.[2239] With some recent exceptions, iPhone users are

unable to change this default setting.[2240] However, they are able to send app-specific links from inside many popular apps. For example, a person can share a link to a song in a third-party music streaming app such that it would open that song in the same app if it is already downloaded on the recipient's smartphone. One app developer has argued, however, that Apple uses its control over iOS to give its own apps and services advantages that are not available to competitors. For example, the developer explained that for years it was barred from integrating with Siri, Apple's intelligent virtual assistant that is built into Apple devices. Although Siri can now integrate with the app, users must explicitly request that Siri launch the third-party app. Otherwise, it will default to launch Apple's service.[2241]

Like setting advantageous defaults and pre-installing its own apps, Apple is also able to preference its own services by reserving access to APIs and certain device functionalities for itself. ACM and technology reporters have both noted that "private APIs have the potential to give Apple apps a competitive advantage," and that "Apple has for a long time favored its own services through APIs."[2242] For example, from the release of iOS 4.3 until iOS 8, "third-party developers had to rely on the UIWebView API to render web pages in iOS apps, while Apple gave its own apps access to a private, faster API," and as a result, "Google's mobile version of Chrome for iOS could not compete with Apple's mobile version of Safari in terms of speed."[2243]

Apple's mobile payments service, Apple Pay, is an example of an in-house app that enjoys an advantage due to its ability to access certain functionalities, such as near-field communication (NFC), on the iPhone that are off-limits to third-party apps. According to Apple, "NFC is an industry-standard, contactless technology" that enables communications between the mobile device and payment terminal.[2244] Apple Pay uses the iPhone's NFC chip to allows users to make contactless payments at retail outlets that use the technology.[2245] However, Apple blocks access for third-party apps. In June 2020, the European Commission opened a formal antitrust investigation into Apple's conduct in the mobile payments market, including "Apple's limitation of access to the Near Field Communication . . . functionality ('tap and go') on iPhones for payments in stores."[2246] In response to questions from

2246 Press Release, Eur. Comm'n, Antitrust: Commission Opens Investigation into Apple Practices Regarding Apple Pay (June 16, 2020) https://ec.europa.eu/commission/presscorner/detail/en/ip_20_1075.

Subcommittee Chairman David N. Cicilline (D-RI) and Representative Kelly Armstrong (D-ND) about Apple's treatment of third-party mobile payment apps and access to the iPhone's NFC chip, Apple said that it limits access to the NFC chip to protect the security of the iPhone and has detailed the differences between Apple's treatment of Apple Pay and third-party mobile payment apps.[2247]

The advantage Apple provides Apple Pay may be heightened during the COVID-19 pandemic. During the pandemic, consumers have accelerated their adoption of contactless payments, with more than half of global consumers preferring contactless payments over cash or traditional credit cards.[2248] In April 2020, MasterCard reported a 40% rise in contactless payments, with the trend expected to continue after the pandemic. MasterCard CEO Ajay Banga explained the trend was driven by shoppers "looking for a quick way to get in and out of stores without exchanging cash, touching terminals, or anything else."[2249]Apple itself has capitalized on the perception that contactless is the safest way to make transactions, marketing Apple Pay as "a safer way to pay that helps you avoid touching buttons or exchanging cash."[2250]

Like Apple Pay, Safari is another pre-installed app that enjoys advantages over rivals. Safari is Apple's default browser on iOS and Mac devices. When someone using an Apple device clicks on a website link, the webpage opens in the Safari browser.[2251] Until the September 2020 release of iOS 14, Apple did not allow consumers to select a third-party web browser as a default.[2252] This was unique to iOS. Other mobile device operating systems allow the user to set a default browser across all applications.[2253]

Apple's policies require alternative browsers apps for iOS (iPhone) to use Apple's WebKit browser engine. As a result, all competing web browser companies must rebuild their product to make it available for iOS users.[2254] Additionally, browser engines are used in other applications that link to web content, such as email applications.[2255] Market participants explained to Subcommittee staff that these guidelines cost significant internal resources and create a hurdle for market entry on iOS. These requirements also make alternative browsers on iOS less technically distinct from Safari, limiting product differentiation.[2256] Further, market participants expressed concern that because Apple mandates the use of WebKit, as opposed to allowing options for developers, WebKit has become slower to innovate and adopt standards.[2257]

At the Subcommittee's second hearing, Chairman David N. Cicilline (D-RI) asked Apple about its policies related to web browser engines. Apple responded, "By requiring use of WebKit, Apple can provide security updates to all our users quickly and accurately, no matter which browser they decide to download from the App Store."[2258] While market participants agree that Apple's WebKit mandates would allow for easier updates to browser apps, there is disagreement about whether WebKit is measurably less secure than other browser engines.[2259]

The Netherlands Authority for Consumers and Markets has noted app providers have limited access to some APIs "that are essential for the functioning of apps. In certain cases, these functionalities are, however, used by Apple for their own apps,"[2260] which may limit competitive alternatives to Apple's products and services.[2261]

In January 2020, Kirsten Daru, Chief Privacy Officer and General Counsel of Tile, offered testimony to Subcommittee about this dynamic.[2262] Tile is a company that makes hardware and software that helps people find lost items. [2263] Ms. Daru testified that for years Tile successfully collaborated with Apple. However, in 2019 reports surfaced that Apple planned a launch a hardware product to compete with Tile.[2264] Ms. Daru said that Apple's 2019 release of iOS 13 harmed Tile's service and user experience while simultaneously introducing a new pre-installed Apple finder app called Find My.[2265] Changes to iOS 13 made it more difficult for Tile's customers to set up the service, requiring several confusing steps to grant Tile permission to track the phone's location.[2266] Meanwhile, Apple's Find My app was pre-installed on iOS devices and activated by default during iOS installation. Users are unable to opt out of Find My's location tracking "unless they go deep into Apple's labyrinthine menu of settings."[2267] Tile's response to the Subcommittee's Questions for the Record included detailed location permission flow comparisons between Tile and Find My.[2268] Tile explained that as a result of Apple's changes to iOS 13, it saw significant decreases in users and a steep drop-off in users enabling the proper settings on iOS devices.[2269]

A group of app developers wrote to Apple CEO Tim Cook in 2019 arguing that Apple's new location notification permission policies will hurt their businesses and accused Apple of acting anticompetitively by was treating its own services differently:

> The developers conclude their email by asserting that Apple's own apps don't have to jump through similar hoops to get access to user location. An Apple app called Find My for tracking the location of other iPhone users, for example, bypasses the locating tracking requests that apps from outside developers must go through, the email reads.

Instead, Find My gains location access through a process that occurs as users install the new operating system.[2270]

The app developers—including Tile, Arity, Life360, Happn, Zenly, Zendrive, and Twenty—explained that this gives Apple products that compete against their apps an advantage. "Apple says Find My and other apps are built into iOS and that it doesn't see a need to make location-tracking requests from users for the apps after they install the operating system."[2271] Apple also differentiates Find My by pointing out that "'Find My' stores user location data *locally* on the user's iPhone, and Apple only transmits the location upon the user's request."[2272]

In response to the Subcommittee's questions after its second hearing, Apple explained that the iOS 13 changes give users more control over background location tracking by apps. Apple also explained that turning on location tracking to Apple's Find My service was "essential" for users, and that the disparate treatment between Find My and Tile was due to the fact that data from Find My remains on the device, while Tile stores data externally.[2273] Additionally, during Apple's June 2020 World Wide Developers Conference, Apple announced that the Find My app would work with third-party finder hardware like Tile's.[2274] However, Apple's service would require companies like Tile to abandon their apps and the ability to differentiate their service from Apple's and other competitors.[2275] Apple's solution would continue to put Tile and other apps and hardware developers offering finder services at a competitive disadvantage.[2276]

iii. App Search Rankings

In response to extensive reporting on the subject, Subcommittee staff has also examined the competitive effects of Apple's search rankings in its App Store. In 2019, the *Wall Street Journal* and *The New York Times* both conducted extensive investigations and reported that Apple appeared to be favoring its apps in the App Store search results.[2277] The *Wall Street Journal* explained that "Apple's mobile apps routinely appear first in search results ahead of competitors in its App Store, a powerful advantage that skirts some of the company's rules on search rankings."[2278] *The New York Times* reported that six years of analysis of App Store search rankings found Apple-owned apps ranked first for at least 700 common search terms. "Some searches produced as many as 14 Apple apps before showing results from rivals," although app developers could pay Apple to place ads at the top of the search results.[2279] Searches for the app titles of competing apps even resulted in Apple's apps ranked first.[2280]

Apple's apps "ranked first in more than 60% of basic searches, such as for 'maps'" and "Apple apps that generate revenue through subscriptions or sales, like Music or Books, showed up first in 95% of searches related to those apps."[2281] *The Wall Street Journal* noted that growing revenue from its apps is core to Apple's strategy of offsetting sluggish hardware sales by increasing revenue from its Services business.[2282]

Rival app developers slipped down the search rankings as Apple introduced new services in their product categories. For example, Spotify had long been the top search result for the query "music," but Apple Music quickly became the top search result shortly after it joined the App Store in June 2016. By the end of 2018, eight of Apple's apps appeared in the first eight search results for "music," and Spotify had fallen to the 23rd result. Similarly, Audiobooks.com was the top-ranked result for "audiobooks" for nearly two years but was overtaken by Apple Books shortly after Apple began marketing for Books. Audiobooks explained to *The Wall Street Journal* that losing the top search ranking to Apple "triggered a 25% decline in Audiobooks.com's daily app downloads."[2283]

Reporting on App Store search revealed that Apple may also advantage its apps by holding them to a different standard when they appear in the App Store search rankings. Apple told *The Wall Street Journal* "it uses 42 factors to determine where apps rank," and that the four most important factors are "downloads, ratings, relevance, and 'user behavior,'" with user behavior the most important factor because it measures how often users select and download an app.[2284] Approximately 40 of Apple's apps come preinstalled on iPhones. These apps do not have reviews and consumers cannot rate them. Mr. Cook explained at the Subcommittee sixth hearing that Apple's "apps that are integrated into the iPhone are not reviewable by users on the App Store."[2285] Apple has also said that its search algorithm works the same for all apps, including its own.[2286]

Despite the fact that Apple's pre-installed apps do not have ratings or reviews—factors that Apple says are most influential in determining app ranking—many of Apple's pre-installed apps "still tend to be ranked first, even when users search for exact titles of other apps."[2287] For example, Apple Books has no reviews or rankings and appears first in a search for "books," while competing apps have tens-of-thousands of customer reviews and ratings of 4.8 or 4.9 stars on Apple's five-star rating system.[2288] A search by Subcommittee staff of terms "music," "news," "TV," and "podcast" returned Apple Music, News, TV, and Podcasts as top-ranked search results, although those apps do not have any reviews or ranking.[2289]

Despite the lack of reviews or rankings, Apple told the *Wall Street Journal* that "the No. 1 position for Books in a 'books' search is reasonable, since it is an exact name match."[2290] Philip Schiller, Apple's Senior Vice President, Worldwide Marketing, who oversees the App Store, and Eddy Cue, Apple's Senior Vice President Internet and Software Services, said "there was nothing underhanded about the algorithm the company had built to display search results in the store,"[2291] and

[2289] Search Results: "music," "news," "TV," "podcast," IOS APP STORE (Sept. 17, 2020).

[2290] Tripp Mickle, *Apple Dominates App Store Search Results, Thwarting Competitors*, WALL ST. J (July 23, 2019), https://www.wsj.com/articles/apple-dominates-app-store-search-results-thwarting-competitors-11563897221.

[2291] Jack Nicas & Keith Collins, *How Apple's Apps Topped Rivals in the App Store it Controls*, N.Y. TIMES (Sept. 9, 2019), https://www.nytimes.com/interactive/2019/09/09/technology/apple-app-store-competition.html.

that Apple's apps tend to rank highly because they are popular and their generic names like Books and Music closely match common search terms.[2292]

It appears that Apple does not apply the same rule to third-party apps. Documents reviewed by Subcommittee staff show that Apple previously punished non-Apple apps that attempted to "cheat" the app store rankings. Apple determined that at least one third-party app had achieved its high search ranking because its name was a generic name that was also a common search term. Apple's employees determined it was cheating to give an app the name of a common search term.

In February 2018, Apple's App Store search team noted that an app named "Photo Editor—Stylo" was the top-ranked result when users searched the App Store for "photo editor."[2293] In an email thread with Philip Schiller, Apple's Senior Vice President, Worldwide Marketing, an Apple employee wrote that "[s]ince the app name matched a broad query term like 'photo editor' the developer was able to game the query with a direct name match."[2294] The Apple employee explained that "[t]he app has been added to the Search Penalty Box for rank demotion," and the action was labeled as complete.[2295] Additional action was slated to disable the initial boost that new apps are given in the app store if the app name is an "exact match to broad queries."[2296] Here, Apple punished an app for the same conduct it said justified Apple's position atop the App Store rankings.

Apple's position as the provider of iOS enables it to designate the App Store as the sole means for app developers to distribute software to iPhone users. Apple's public statements, including testimony by Mr. Cook that Apple's apps "go through the same rules" as more than 1.7 million third-party apps appear to be inconsistent with Apple's actual practices.[2297] In this case, Apple leveraged its control of iOS and the App Store to give its own apps preferential treatment, and applied a different set of rules than third-party apps, punishing them for the very conduct Apple engaged in. Subcommittee staff did not have access to additional evidence from Apple to determine how widespread this practice is within the company.

iv. Competitively Sensitive Information

In addition to investigating allegations Apple engages in self-preferencing in the App Store, the Committee sought information regarding whether Apple exploits third-party developers that rely on

[2292] *Id.*; *see also* Apple, *Apple: Distinctive Products with a Seamless, Integrated User Experience* 23 (July 13, 2020) (on file with Comm.) distribution in the App Store. Developers have alleged that Apple abuses its position as the provider of iOS and operator of the App Store to collect competitively sensitive information about popular apps and then build competing apps or integrate the popular app's functionality into iOS.[2298] The practice is known as "Sherlocking." The antitrust laws do not protect app developers from competition, and platforms should continue to innovate and improve their products and services. However, Sherlocking can be anticompetitive in some instances.[2299]

Some app developers have complained that Apple leverages its control of iOS and the App Store to glean business intelligence that enables it to better compete against third-party apps.[2300] For example, after a stress relief app called Breathe was Sherlocked in 2016, the app's developers said that Apple used third-party developers "as an R&D arm."[2301] *The Washington Post* reported on the phenomenon, explaining:

> Developers have come to accept that, without warning, Apple can make their work obsolete by announcing a new app or feature that uses or incorporates their ideas. Some apps have simply buckled under the pressure, in some cases shutting down. They generally don't sue Apple because of the difficulty and expense in fighting the tech giant—and the consequences they might face from being dependent on the platform.[2302]

At the Subcommittee's fifth hearing, Subcommittee Vice Chairman Joe Neguse (D-CO) asked Ms. Daru of Tile about how Apple used competitively sensitive information it collects as the owner of the iOS ecosystem to compete against third-party apps. She explained that as an operating system provider and App Store operator, Apple knows who Tile's customers are, the types of apps those customers preferred, and the demographics of iOS users that look at Tile's app or search for similar apps—information that would give Apple a competitive advantage against Tile.[2303] Ms. Daru testified

[2303] Competitors Hearing Transcript at 53 (statement of Kirsten Daru, Chief Privacy Officer & Gen. Counsel, Tile, Inc.).

that Apple had harmed Tile's service and user experience while simultaneously introducing a rival app and preparing to launch a rival hardware product.[2304] Blix, developer of email management app BlueMail, has sued Apple in federal court claimed Apple has engaged in Sherlocking and infringed the patents underlying BlueMail:

> Apple frequently takes other companies' innovative features, adds those ideas to Apple's own software products without permission, and then either ejects the original third-party application from the App Store (as it did with Blix's software) or causes the third-party software developer to close its doors entirely.[2305]

In response to the requests for information, Match Group told the Subcommittee that Apple has a history of "closely monitoring the success of apps in the App Store, only to copy the most successful of them and incorporate them in new iPhones" as a pre-installed app.[2306] Phillip Shoemaker, Apple's former Senior Director of App Store Review, similarly told Subcommittee staff that during his time at Apple, an app developer proposed an innovative way to wirelessly sync the iPhone and Mac.[2307] The app did not violate any of Apple's Guidelines, but it was rejected from the App Store nonetheless.[2308] Apple then appropriated the rejected app's feature for its own offerings.[2309]

During the Subcommittee's sixth hearing, Subcommittee Vice Chairman Joe Neguse (D-CO) asked Mr. Cook about Tile's testimony. In particular, he asked if Apple has access to the confidential information of app developers, and whether Apple's Developer Agreement explicitly authorizes Apple to use developers' information to build apps to compete against them.[2310] Mr. Cook's answer was non-responsive regarding allegations of Sherlocking. Instead, he said that Apple does not violate other companies' intellectual property rights.[2311]

[2309] *Id.*

[2310] CEO Hearing Transcript at 177 (question of Rep. Neguse (D-CO), Vice Chairman, Subcomm. on Antitrust, Commercial and Admin. Law of the H. Comm. on the Judiciary).

[2311] *Id.* at 177–78 (statement of Tim Cook, CEO, Apple Inc.) ("[Apple] run[s] the App Store to help developers, not hurt them. We respect innovation. It's what our company was built on. We would never steal somebody's IP.").

In contrast, Apple co-founder and former CEO Steve Jobs once noted that "[w]e have always been shameless about stealing great ideas."[2312] The Apple Developer Agreement, which Apple requires every app developer to agree to, appears to warns developers that in exchange for access to the App Store, Apple is free to build apps that "perform the same or similar functions as, or otherwise compete with" apps in the App Store.[2313] Additionally, "Apple will be free to use any information, suggestions or recommendations you provide to Apple pursuant to this Agreement for any purpose, subject to any applicable patents or copyrights."[2314]

Mr. Cook's statement that Apple's apps play by the same rules as other apps appears contrary to Apple's stated policies. While the Apple Developer Agreement provides Apple the right to replicate third-party apps, Apple's Guidelines direct developers not to "copy another developer's work" and threaten removal of apps and expulsion from the Developer Program for those that do.[2315] Further, the Guidelines instruct developers to "[c]ome up with your own ideas" and admonishes them to not "simply copy the latest popular app on the App Store, or make some minor changes to another app's name or UI and pass it off as your own."[2316] Lastly, Apple differentiates between—rather than conflates or confuses—copycat apps and intellectual property infringement, which are both prohibited in the App Store.[2317]

v. Excluding Rival Apps

During the Subcommittee's sixth hearing, Representatives Val Demings (D-FL) and Lucy McBath (D-GA) asked questions regarding Apple's removal of parental control apps from the App Store in 2018 and 2019. In 2018, Apple announced its Screen Time app, a new feature bundled with iOS 12 that helped iOS users limit the time they and their children spent on the iPhone. Thereafter, Apple began to purge many of the leading rival parental control apps from the App Store. Apple explained the apps were removed because they used a technology called Mobile Device Management (MDM). MDM technology allowed parents to remotely take over their children's phones and block

content. Apple noted that MDM could allow the app developer to access sensitive content on the device.[2318]

According to *The New York Times*, the parental control apps using MDM had been offered in the App Store for years, and hundreds of updates to those apps had been approved by Apple.[2319] As a result, many apps were forced to shut down,[2320] although some were given a reprieve.[2321] Two parental control apps filed a complaint with the European Commission, alleging Apple's App Store policies were anticompetitive. The complaint alleged that Apple purged competitors when it introduced Screen Time, pre-installed Screen Time on iOS 12 and activated it by default, and gave Screen Time access to iOS functionalities it denied to competing third-party apps.[2322]

Subcommittee staff reviewed emails from parents who contacted Apple to complain about the removal of one of the purged parental control apps.[2323] They said that Screen Time was a comparably worse option for consumers—and described it as "more complicated" and "less restrictive" than competitors.[2324] In emails to the company reviewed by Subcommittee staff, parents complained about Apple's monopoly power over app distribution on iOS and claimed that self-interest in promoting

Screen Time motivated Apple's actions.[2325] In response, Apple's Senior Vice President, Worldwide Marketing, Phil Schiller, explained that Screen Time was "designed to help parents manage their children's access to technology."[2326] He added that Apple would "work with developers to offer many great apps on the App Store for these uses, using technologies that are safe and private for us and our children."[2327]

Internally, Apple's Vice President of Marketing Communications, Tor Myhren, stated,"[t]his is quite incriminating. Is it true?" in response to an email with a link to *The New York Times*' reporting.[2328] Apple's communications team asked CEO Tim Cook to approve a "narrative" that Apple's clear-out of Screen Time's rivals was "not about competition, this is about protecting kids [sic] privacy."[2329]

Developers of the purged apps also contacted Apple, outraged that they had been removed from the App Store while other apps that used MDM remained.[2330] One developer explained it had invested more than $200,000 building its parental control app, then another $30,000 to fix the problem Apple identified, only to be told that Apple would no longer support parental control apps in the App Store.[2331]

Although Apple claimed its conduct was motivated to protect privacy and not intended to clear out competitors to Screen Time, Apple reinstated many of the apps the same day that it was reported the Department of Justice was investigating Apple for potential antitrust violations. [2332] Apple's solution to address privacy concerns was to ask the apps to promise not to sell or disclose user data to third parties, which could have been achieved through less restrictive means and without removing those apps from the App Store.[2333]

Developers of parental control apps asked Apple to "release a public API granting developers access to the same functionalities that Apple's native 'Screen Time' uses."[2334] Eventually, Apple did grant some apps access to APIs,[2335] but only after rival app developers were accused of being a risk to children's privacy, removed from the App Store, and forced to incur significant costs.[2336] As one developer noted, Apple's new MDM privacy policies resulted in "really nothing much changing from the developer side as far as the technology goes."[2337]

Here, Apple's monopoly power over app distribution enabled it to exclude rivals to the benefit of Screen Time. Apple could have achieved its claimed objective—protecting user privacy—through less restrictive means, which it ultimately did only after significant outcry from the public and a prolonged period of harm to rivals.[2338] Apple's conduct here is a clear example of Apple's use of privacy as a sword to exclude rivals and a shield to insulate itself from charges of anticompetitive conduct.

Subcommittee staff learned that Apple has engaged in conduct to exclude rivals to benefit Apple's services in other instances. For example, Mr. Shoemaker explained that Apple's senior executives would find pretextual reasons to remove apps from the App Store, particularly when those apps competed with Apple services.[2339]

vi. Opaque Guidelines and Arbitrary Enforcement

At the Subcommittee's sixth hearing, Representative Henry C. "Hank" Johnson, Jr. (D-GA) asked Mr. Cook about how the App Store Developer Guidelines are interpreted and applied to developers in the App Store. Subcommittee Chairman David N. Cicilline (D-RI) requested similar information about the Guidelines as well, including how they have evolved and whether there are "unwritten rules" developers must comply with.

The Guidelines are the rules with which more than 20 million iOS app developers and more than 1.8 million apps in the App Store must comply to reach "hundreds of millions of people around

2339 Interview with Phillip Shoemaker, former Senior Dir., App Store Review, Apple Inc. (Sept. 21, 2020).

the world."[2340] Apple notes that the App Store is "highly curated" and that "every app is reviewed by experts."[2341] The introductory section of the Guidelines warns that Apple can create new rules at any time, and explains "[w]e will reject apps for any content or behavior that we believe is over the line. What line, you ask? Well as a Supreme Court Justice once said, 'I'll know it when I see it.' And we think that you will also know it when you cross it."[2342]

App developers the Subcommittee spoke with expressed frustration with Apple's curation of the App Store. Cofounder and Chief Technology Officer of Basecamp, David Heinemeier Hansson, testified before the Subcommittee and explained:

> It's complete tyranny, and the rules are often interpreted differently by different reviewers because they're intentionally left vague. So we live in constant fear we may have violated these vague rules, and that the next update to our applications will be blocked by Apple. There are countless examples where developers large and small have been denied access to publish their applications without explanation for days or even weeks at a time. It's insufferable.[2343]

One social media platform expressed concern that Apple has absolute discretion about whether to approve apps or accept updates.[2344] Developers are frustrated that Apple's interpretation and enforcement of the Guidelines have changed over time, despite prior precedents and the fact developers rely on understanding the Guidelines to operate their businesses. One developer described Apple's Guidelines as "arbitrarily interpreted," and another party called them "opaque and arbitrary."[2345] Internally, after an app was rejected from the App Store, an Apple employee wrote to the leadership of the App Store that Apple's decision "still isn't obvious to people inside the company that work directly on the App Store."[2346]

In 2017, *Gizmodo* reported that iOS app maker Deucks saw its Finder for AirPods app removed from the App Store. The app used the iPhone's Bluetooth signal to locate lost AirPods, helping its users find a missing earbud and save money by not having to purchase replacements. After the app was reviewed and approved, it disappeared from the App Store. Deucks told Gizmodo that Apple's app

review team "didn't find anything wrong with the app itself, but rather they didn't like the 'concept' of people finding their AirPods and hence [the app] was deemed 'not appropriate for the App Store.'"[2347] At the time, Deucks had several other finder apps, such as Finder for Fitbit and Finder for Jawbone, that remained available in the App Store.[2348]

Developers also say that Apple uses its power over the App Store to change the Guidelines when convenient in ways that benefit Apple. The Guidelines—along with their interpretation and enforcement—all change over time in ways that always appear to benefit Apple.[2349] Spotify noted that "[t]he reality is Apple continues to move the goal posts and change the rules to its advantage and the detriment of developers," and that the company's "selective and capricious enforcement [of its App Store policies] is designed to put companies like [Spotify] at an untenable competitive disadvantage."[2350] ProtonMail explained that it offered a free version of its app in the App Store for years, but then Apple abruptly changed the way it applied its IAP requirement and demanded the app add the ability for consumers to purchase upgraded functionality through the app—giving Apple a 30% cut from those subscriptions. ProtonMail noted that its app competes with an Apple service and that requiring it to implement IAP would increase its customer acquisition costs and make it less competitive, benefitting Apple.[2351] Another third party Subcommittee staff spoke with said that when Apple introduces a new app, developers with rival apps know they may be targeted for a violation of a rule Apple has suddenly decided to interpret or enforce differently.[2352] Another app developer that competes with Apple services noted the Guidelines are constantly shifting, that Apple arbitrarily decides when an app no longer complies with the rules, and those decisions always favor Apple's interests.[2353]

Others have noted that Apple unilaterally determines if, how, and when to apply its Guidelines, and that it also freely makes up "unwritten rules" when convenient.[2354] For example, Apple's

Subcommittee staff reviewed communications between Apple CEO Tim Cook and an executive from Baidu regarding whether Apple would provide Baidu with preferential treatment. At the Subcommittee's sixth hearing, Representative Henry C. "Hank" Johnson, Jr. (D-GA) questioned Mr. Cook about whether Apple differentiates in its treatment of app developers. Representative Johnson also asked if it was true that Apple assigned Baidu two employees to help it navigate the App Store bureaucracy, and whether other app developers receive the same access to Apple personnel. Mr. Cook responded, "we treat every developer the same," and explained the App Store Guidelines "apply evenly to everyone."[2358] He also said, "I don't know about that, sir," in response to Representative Johnson's inquiry about Baidu, adding, "We do a lot of things with developers including looking at their beta test apps regardless of whether they're large or small."[2359]

Communications reviewed by Subcommittee staff show that in 2014 Baidu requested, among other things, that Apple "set up a fast track for the review process for Baidu APPs," along with setting Baidu as the default search and mapping services on "all Apple devices in China."[2360] Mr. Cook solicited feedback from Apple's senior executives regarding these and other requests from Baidu, also noting, "I think we should have someone focus on them as we have done with Facebook. Thoughts?"[2361] Responding to the email thread with Mr. Cook's request that Apple focus on Baidu as it had with Facebook, one executive explained, "Engineering proposal is for extensions to be our path

for integration," and responded to Baidu's app review fast track request, "I believe we put a lot of work into having a fast review process for all apps."[2362]

Within two weeks, Mr. Cook responded to the Baidu executive's requests. "I'd like Apple to have a deeper relationship with Baidu," Cook wrote, noting that "some of" the Baidu executive's requests were "great starts."[2363] In response to the Baidu executive's request for "APP Review Fast Track," Mr. Cook wrote, "We can set up a process where Baidu could send us a beta app for review and this can often speed up the process."[2364] Mr. Cook then noted he had assigned Baidu two employees from App Store chief Phil Schiller's team to "help manage through Apple."[2365]

When asked about these issues in questions submitted for the record following the hearing, Mr. Cook explained his view that "There is no 'fast track' for App Review special to Baidu," that "any developer can request expedited review from App Review by submitting a formal expedite request," and "[t]he beta app review process I referenced in my email has been available to developers since 2009."[2366] Mr. Cook also noted, "The key contacts referenced in my email were focused on other strategic opportunities outlined by Baidu. Neither individual had responsibility for App Store review."[2367]

In a subsequent interview with Phillip Shoemaker, Apple's former Senior Director of App Store Review, Subcommittee staff asked about Apple's treatment of app developers. Mr. Shoemaker responded that Apple "was not being honest" when it claims it treats every developer the same.[2368] Mr. Shoemaker has also written that the App Store rules were often "arbitrary" and "arguable," and that "Apple has struggled with using the App Store as a weapon against competitors."[2369] He has noted that "Apple has complete and unprecedented power over their customers' devices. The decisions they make with regards to third-party apps needs to be above reproach, and currently are not."[2370]

Mr. Shoemaker also admitted that Apple advantages its own apps over third-party apps. In an interview with Subcommittee staff, he described it as inaccurate to say Apple does not favor its own

[2368] Interview with Phillip Shoemaker, former Senior Dir., App Store Review, Apple Inc. (Sept. 21, 2020).

[2369] Phillip Shoemaker, *A Modern Content Store*, MEDIUM (Dec. 12, 2017), https://medium.com/@phillipshoemaker/a-modern-content-store-3344bbe79edc.

[2370] Phillip Shoemaker, *Apple v. Everybody*, MEDIUM (Mar. 29, 2019), https://medium.com/@phillipshoemaker/apple-v-everybody-5903039e3be.

apps over third-party apps.[2371] He has previously noted that apps that compete against Apple's services often have problems getting through the App Store's review process. For example, Apple's gaming service, Apple Arcade, is a type of app that was "consistently disallowed from the store" when offered by third-party developers, but Apple allowed its own app in the store, "even though it violates existing [App Store] guidelines."[2372] Mr. Shoemaker explained to Subcommittee staff that Apple's new Guideline 3.1.2a, related to streaming game services, was likely written to "specifically exclude Google Stadia," describing the decision as "completely arbitrary."[2373] Similar conduct has been commented on by the courts,[2374] as well as international antitrust authorities.[2375]

Apple disputes that its rules are opaque and arbitrarily applied. In response to questions from Representative Henry C. "Hank" Johnson, Jr. (D-GA), Mr. Cook insisted the Guidelines are "open and transparent" and that Apple "treat[s] every developer the same."[2376] In response to Questions for the Record from Subcommittee Chairman David N. Cicilline (D-RI), Mr. Cook reiterated that "[t]he Guidelines provide transparency and act as a practical guide to help developers better understand the app approval process. . . . Apple attempts to apply the Guidelines uniformly to all developers and all types of apps."[2377]

Apple appears to have recently revised some of its App Store policies under the scrutiny of the Subcommittee, the Department of Justice, and global competition authorities. In June 2020, Apple announced new policies for its App Store review that will allow app developers to appeal decisions by app reviewers and even challenge the Guidelines governing the App Store. Apple also announced that app updates with bug fixes would no longer be held up due to a violation of an App Store guideline. Additionally, on September 11, 2020, Apple changed its App Developer Guidelines to address some of the questions which arose from recent controversies described earlier in this Report.[2378]

3. Siri Intelligent Voice Assistant

a. Market Power

Apple describes Siri as "an intelligent assistant that offers a faster, easier way to get things done on Apple devices," helping users to "make calls, send text messages or email, schedule meetings and reminders, make notes, search the Internet, find local businesses, get directions, get answers, find facts, and more just by asking."[2379] Apple integrated Siri into iPhone 4S at its release in October 2011. As of January 2018, Apple said Siri was active on over 500 million devices, making Siri one of the most widely used voice assistants in the world.[2380]

In a production to the Committee, Apple stated that it neither creates market share data for Siri nor tracks third-party market share data for integrated voice assistants.[2381] Market research firm FutureSource Consulting found that as of December 2019, Siri was the leading intelligent virtual assistant with a 35% market share globally.[2382] A third-party supplied the Subcommittee with additional market research showing that, in the first half of 2018, Apple's Siri was built into 42% of virtual assistant-enabled devices sold worldwide.[2383] Apple, Google, Amazon, and Microsoft are the leading providers of intelligent virtual assistants.[2384] Siri's success reflects its integration into the iPhone and other Apple hardware, such as the iPad, Mac, Apple Watch, Apple TV, and HomePod.[2385] Siri is the hub of Apple's ecosystem of smart-home devices. Users can control Apple HomeKit-compatible devices using Siri on an Apple device.[2386]

b. Merger Activity

The startup Siri, Inc launched the Siri app for iOS in February 2010 based on a prototype developed by Adam Cheyer while working at SRI International Research Lab.[2387] Apple acquired the company two months later.[2388] Apple has followed up on its acquisition of Siri with a series of additional acquisitions to strengthen Siri's underlying technology and natural language processing. For example, in 2019, Apple acquired Laserlike, technology to help Siri improve at delivering personalized results for users.[2389] In 2020, Apple acquired Inductiv, an AI technology for correcting data flaws, Xnor.ai, which specializes in low-power, edge-based artificial-intelligence tools needed for smart home devices, and Voysis, to increase Siri's speech recognition accuracy.[2390]

c. Conduct

As with many of Apple's other products and services, Apple has taken a walled garden approach to the intelligent voice assistant market by, among other tactics, limiting interoperability by restricting how digital voice assistants work on Apple devices and how Siri works with non-Apple devices, and by using Siri to guide users to its own products and services.

Apple does not allow competing digital voice assistants to replace Siri as the default on Apple devices. On iOS devices, the user must download the app for a competing digital voice assistant and then either use Siri to access that voice assistant or use that app directly.[2391] Additionally, Apple does not allow third-party device manufacturers to install a speaker that receives Siri commands; only Apple devices can respond to the "Hey Siri" prompt.[2392] While third-party hardware manufacturers can make their products Siri-compatible through the Works with Apple HomeKit, the voice commands needed to

control the smart devices must still be directed to Siri on an Apple device, such as an iPhone or iPad.[2393]

In addition to keeping Siri closely tied to Apple hardware, Apple has used its voice-enabled devices to strengthen consumer engagement with its own services and apps. For example, as of October 2020, by default, requests to Siri to play music open the Apple Music app, requests for directions open the Apple Maps app, and requests for web searches open the Safari app.[2394] To use a competing service through Siri, a user must adjust the device's settings and identify the service in the command to Siri—for example, "Hey Siri, play the National Anthem on Spotify."[2395] For streaming music services, this integration only became possible with the introduction of iOS 13 in 2019.[2396] Previously, even when a user said the name of a third-party streaming service in the voice command, Apple opened an Apple-branded alternative.[2397] In June 2020, Apple announced that it would update its HomePod smart speaker system to support third-party music services.[2398] It remains unclear how seamless the integration will be and if Apple Music will remain the pre-installed default service.[2399]

One app developer that spoke with Subcommittee staff described Siri as a "closed" intelligent virtual assistant that limits the types of voice interactions voice app developers have access to.[2400] The app developer explained that SiriKit, which allows iOS apps to work with Siri, relies on a pre-designed list of basic interactions that third parties can use, such as messaging, calling, or payments. The very limited set of interactions permitted by Apple can make it impossible to launch an app for the third party's services, including those that compete with an Apple service.[2401]

These practices have recently come under scrutiny by antitrust authorities. In March 2019, Spotify filed a complaint against Apple before the European Commission, reportedly alleging, among other things, that Apple is restricting Spotify's access to Siri.[2402] In July 2020, the European Commission's antitrust authority announced that it had opened an inquiry into the use of digital assistants and smart home products by Apple, Google, and Amazon, among other companies.[2403] In her statement accompanying the announcement, Margrethe Vestager, the Commission's Executive Vice President, identified interoperability and self-preferencing as areas of concern.[2404]

VI. RECOMMENDATIONS

As part of its top-to-bottom review of competition in digital markets, the Subcommittee examined whether current laws and enforcement levels are adequate to address the market power concerns identified through this investigation. In pursuit of this goal, on March 13, 2020, the Subcommittee requested submissions from antitrust and competition policy experts. These experts were chosen on a careful, bipartisan basis to ensure the representation of a full range of views. Throughout the investigation, the Subcommittee received additional submissions and written statements from antitrust enforcers and other leading experts, including Margrethe Vestager, the Executive Vice President of the European Commission, and Rod Sims, the Chair of the Australian Competition and Consumer Commission. Most recently, the Subcommittee held an oversight hearing on October 1, 2020 regarding "Proposals to Strengthen the Antitrust Laws and Restore Competition Online," its seventh and final hearing as part of the investigation.

[2404] *Id.*

Subcommittee Chairman David N. Cicilline (D-RI) requested that staff provide Members of the Subcommittee with a series of recommendations, informed by this investigation, on how to strengthen the antitrust laws and restore competition online. As he noted in remarks to the American Antitrust Institute in June 2019:

> No doubt, other branches of government have a key role to play in the development of antitrust law. But Congress—not the courts, agencies, or private companies—enacted the antitrust laws, and Congress ultimately decides what the law should be and whether the law is working for the American people. As such, it is Congress' responsibility to conduct oversight of our antitrust laws and competition system to ensure that they are properly working and to enact changes when they are not. While I do not have any preconceived ideas about what the right answer is, as Chairman of the Antitrust Subcommittee, I intend to carry out that responsibility with the sense of urgency and serious deliberation that it demands.[2405]

In response to this request, Subcommittee staff identified a broad set of reforms for further examination by the Members of the Subcommittee for purposes of crafting legislative and oversight responses to the findings of this Report. These reforms include proposals to: (1) promote fair competition in digital markets; (2) strengthen laws relating to mergers and monopolization; and (3) restore vigorous oversight and enforcement of the antitrust laws.

Subcommittee staff intends for these recommendations to serve as a complement, not a substitute, to strong enforcement of the antitrust laws. This is particularly true for acquisitions by dominant firms that may have substantially lessened competition or tended to create a monopoly in violation of the Clayton Act. In these cases, Subcommittee staff supports as a policy matter the examination of the full range of remedies—including unwinding consummated acquisitions or divesting business lines—to fully restore competition that was harmed as a result of these acquisitions and to prevent future violations of the antitrust laws.[2406]

A. Restoring Competition in the Digital Economy

For more than a century, Congress has addressed the market power of dominant intermediaries using a robust antitrust and antimonopoly toolkit.[2407] The antitrust laws prohibit anticompetitive

mergers and monopolistic conduct in order to promote open markets and prevent undue concentration of economic power. In many critical sectors of the economy—including financial services, telecommunications, and transportation—Congress has also relied on a broad set of policies to create the conditions necessary for fair competition, even when economies of scale may favor concentration.

In a similar vein, the remedies identified in this section seek to restore competition online by addressing harmful business practices as well as certain features of digital markets that tend to tip the market towards concentration.

1. <u>Reduce Conflicts of Interest Thorough Structural Separations and Line of Business Restrictions</u>

In addition to controlling one or multiple key channels of distribution, the dominant firms investigated by the Subcommittee are integrated across lines of business. When operating in adjacent markets, these platforms compete directly with companies that depend on them to access users, giving rise to a conflict of interest. As discussed earlier in this Report, the Subcommittee's investigation uncovered several ways in which Amazon, Apple, Facebook, and Google use their dominance in one or more markets to advantage their other lines of business, reducing dynamism and innovation.

First, the investigation revealed that the dominant platforms have misappropriated the data of third parties that rely on their platforms, effectively collecting information from customers only to weaponize it against them as rivals. For example, the investigation produced documents showing that Google used the Android operating system to closely track usage trends and growth patterns of third-party apps—near-perfect market intelligence that Google can use to gain an edge over those same apps. Facebook used its platform tools to identify and then acquire fast-growing third-party apps, thwarting competitive threats at key moments. A former Amazon employee told the Subcommittee that Amazon has used the data of third-party merchants to inform Amazon's own private label strategy, identifying which third-party products were selling well and then introducing copycat versions. These and other examples detailed in this Report demonstrate a dangerous pattern of predatory conduct that, if left unchecked, risk further concentrating wealth and power.

Some have suggested that there is little difference between the dominant platforms' access to and use of this data and the way that brick-and-mortar retailers track popular products. The Subcommittee's investigation, however, produced evidence that the platforms' access to competitively significant market data is unique. Specifically, the dominant platforms collect real-time data which, given the scale of their user-base, is akin to near-perfect market intelligence. Whereas firms with a choice among business partners might seek to protect their proprietary data, the platforms' market power lets them compel the collection of this data in the first place.

---

preservation of the American competitive economy" and reflecting the legislative policy that "under no circumstances should [laws] foster the growth of monopoly").

Second, dominant platforms can exploit their integration by using their dominance in one market as leverage in negotiations in an unrelated line of business. For example, evidence produced during the investigation showed that Amazon has leveraged its dominance in online commerce as pressure during negotiations with firms in a separate line of business. Market participants that depend on Amazon's retail platform are effectively forced to accept its demands—even in markets where Amazon would otherwise lack the power to set the terms of commerce.

Third, dominant platforms have used their integration to tie products and services in ways that can lock in users and insulate the platform from competition. Google, for example, required that smartphone manufacturers seeking to use Android also pre-install and give default status to certain Google apps—enabling Google to maintain its search monopoly and crowd out opportunities for third-party developers.

And fourth, these firms can use supra-competitive profits from the markets they dominate to subsidize their entry into other markets. Documents uncovered during the Subcommittee's investigation indicate that the dominant platforms have relied on this strategy to capture markets, as startups and non-platform businesses tend to lack the resources and capacity to bleed billions of dollars over multiple years in order to drive out rivals. For dominant platforms, meanwhile, this strategy appears to be a race to capture ecosystems and control interlocking products that funnel data back to the platforms, further reinforcing their dominance.

By using market power in one area to advantage a separate line of business, dominant firms undermine competition on the merits. By functioning as critical intermediaries that are also integrated across lines of business, the dominant platforms face a core conflict of interest. The surveillance data they collect through their intermediary role, meanwhile, lets them exploit that conflict with unrivaled precision. Their ability both to use their dominance in one market as negotiating leverage in another, and to subsidize entry to capture unrelated markets, have the effect of spreading concentration from one market into others, threatening greater and greater portions of the digital economy.

To address this underlying conflict of interest, Subcommittee staff recommends that Congress consider legislation that draws on two mainstay tools of the antimonopoly toolkit: structural separation and line of business restrictions.[2408] Structural separations prohibit a dominant intermediary from operating in markets that place the intermediary in competition with the firms dependent on its infrastructure. Line of business restrictions, meanwhile, generally limit the markets in which a dominant firm can engage.

[2408] *See* Submission from Sally Hubbard, Dir. of Enforcement Strategy, Open Mkts. Inst. et al., to H. Comm. on the Judiciary, 7–8 (Apr. 17, 2020) (on file with Comm.) AR_003670

Congress has relied on both policy tools as part of a standard remedy for dominant intermediaries in other network industries, including railroads and telecommunications services.[2409] In the railroad industry, for example, a congressional investigation found that the expansion of common carrier railroads' into the coal market undermined independent coal producers, whose wares the railroads would deprioritize in order to give themselves superior access to markets. In 1893, the Committee on Interstate and Foreign Commerce wrote that "[n]o competition can exist between two producers of a commodity when one of them has the power to prescribe both the price and output of the other."[2410]

Congress subsequently enacted a provision to prohibit railroads from transporting any goods that they had produced or in which they held an interest.[2411] Congress has legislated similar prohibitions in other markets. The Bank Holding Company Act of 1956 broadly prohibited bank holding companies from acquiring nonbanking companies.[2412] Vertically integrated television networks, meanwhile, were subject to "fin-syn" rules, which prohibited networks from entering production and syndication markets.[2413]

Both structural separations and line of business restrictions seek to eliminate the conflict of interest faced by a dominant intermediary when it enters markets that place it in competition with dependent businesses. In certain cases, structural separations have also been used to prevent monopolistic firms from subsidizing entry into competitive markets and to promote media diversity.[2414]

At a general level, there are two forms of structural separation: (1) ownership separations, which require divestiture and separate ownership of each business; and (2) functional separations, which permit a single corporate entity to engage in multiple lines of business but prescribe the particular organizational form it must take.[2415] Importantly, both forms of structural limits apply on a market-wide basis, while divestitures in antitrust enforcement generally apply to a single firm or merging party.

[2415] John Kwoka & Tommaso Valletti, *Scrambled Eggs and Paralyzed Policy: Breaking Up Consummated Mergers and Dominant Firms* 22 (forthcoming Oct. 2020) (on file with Comm.).

A benefit of these proposals is their administrability. By setting rules for the underlying structure of the market—rather than policing anticompetitive conduct on an *ad hoc* basis—structural rules are easier to administer than conduct remedies, which can require close and continuous monitoring.[2416]

The challenges of crafting and implementing structural solutions vary by market and market participants. In response to the Subcommittee's requests for comments on potential reforms, some antitrust experts have cautioned that crafting separations can pose a major cost and challenge, especially in dynamic markets.[2417] Others have responded by identifying certain principles that can make identifying the fault lines easier. In the case of separations undoing vertical mergers, the fault lines designating the separate companies are likely to still be apparent, even in the new structure.[2418] In cases where a firm grew through internal expansion or when the constituent parts are no longer clearly distinguishable, scholars have suggested identifying distinct business operations.[2419] Experts have also noted that business-initiated corporate restructuring and divestitures may in some cases also provide a guide to designing and implementing successful break-ups.[2420]

Several enforcement bodies around the world are exploring the use of structural separations in digital markets. In July 2020, the United Kingdom's Competition and Markets Authority recommended that its digital regulatory body have powers to "implement ownership separation or operational separation," concluding that "there could be significant benefits if there were more formal separation between businesses with market power" in digital advertising markets in particular.[2421] Meanwhile, the OECD in 2001 adopted recommendations to structurally separate vertically integrated regulated firms that operate in concentrated markets.[2422] In its 15-year overview, the OECD concluded that "structural separation remains a relevant remedy" and identified other market areas where it might be adopted.[2423]

2. Implement Rules to Prevent Discrimination, Favoritism, and Self-Preferencing

As discussed throughout this Report, the Subcommittee identified numerous instances in which dominant platforms engaged in preferential or discriminatory treatment. In some cases, the dominant platform privileged its own products or services. In others, a dominant platform gave preferential treatment to one business partner over others. Because the dominant platform was, in most instances, the only viable path to market, its discriminatory treatment had the effect of picking winners and losers in the marketplace.

Google, for example, engaged in self-preferencing by systematically ranking its own content above third-party content, even when its content was inferior or less relevant for users. Web publishers of content that Google demoted suffered economic losses and had no way of competing on the merits. Over the course of the investigation, numerous third parties also told the Subcommittee that self-preferencing and discriminatory treatment by the dominant platforms forced businesses to lay off employees and divert resources away from developing new products and towards paying a dominant platform for advertisements or other ancillary services. They added that some of the harmful business practices of the platforms discouraged investors from supporting their business and made it challenging to grow and sustain a business even with highly popular products. Without the opportunity to compete fairly, businesses and entrepreneurs are dissuaded from investing and, over the long term, innovation suffers.

In response to these concerns, the Subcommittee recommends that Congress consider establishing nondiscrimination rules to ensure fair competition and to promote innovation online. Nondiscrimination rules would require dominant platforms to offer equal terms for equal service and would apply to price as well as to terms of access. As several experts noted, nondiscrimination has been a mainstay principle for governing network intermediaries, especially those that play essential roles in facilitating transportation and communications.[2424]

The 1887 Interstate Commerce Act, for example, prohibited discriminatory treatment by railroads.[2425] In the century years since, Congress and policymakers have continued to apply nondiscrimination principles to network monopolies, even as technologies have rapidly evolved. Most recently, the Open Internet Order written by the Federal Communications Commission (FCC) in 2015 was effectively a nondiscrimination regime, prohibiting internet service providers from picking

winners and losers among content providers and other users.[2426] Other jurisdictions have begun to apply nondiscrimination principles to digital markets. For example, after determining that Google had engaged in illegal self-preferencing, the European Commission required that Google follow "the simple principle of equal treatment."[2427]

Historically, Congress has implemented nondiscrimination requirements in a variety of markets. With railroads, the Interstate Commerce Commission oversaw obligations and prohibitions applied to railroads designated as common carriers.[2428] More recently, the Cable Act of 1992 included a provision requiring the Federal Communications Commission to oversee a nondiscrimination requirement for cable operators.[2429] Some experts have proposed establishing a similar venue to adjudicate discrimination disputes between dominant platforms and the third parties that depend on them.[2430] Others note that the Federal Trade Commission could also use its existing competition rulemaking authority to "require dominant gatekeepers to apply a rule of neutrality in operating their platforms."[2431]

Finally, on several occasions, nondiscrimination rules have been treated as an important complement to divestitures in antitrust enforcement. For example, the Justice Department combined AT&T's divestiture of the Regional Bell Operating Companies with an equal access obligation, requiring AT&T to offer independent long-distance providers access to its network on equal terms of quality and price.[2432] The DOJ argued that requiring equal access without mandating divestiture would be insufficient due to AT&T's incentive and ability to discriminate against local carriers.[2433]

[2426] Protecting and Promoting the Open Internet, 30 FCC Rcd. 5601, 5603, para. 4 (2015) ("[C]arefully-tailored rules that would prevent specific practices we know are harmful to Internet openness—blocking, throttling, and paid prioritization—as well as a strong standard of conduct designed to prevent the deployment of new practices that would harm Internet openness.").

[2433] Mitchell Submission at 4 ("It's important to note here that applying this kind of [nondiscrimination-based] regulatory oversight to the big tech firms will not be effective unless it's done in conjunction with breakups. In the case of Amazon, it's my view that several factors make it virtually impossible to establish a system of oversight and adjudication that would be robust enough to protect competition and fair market access, absent spinning off its shopping platform from its other divisions. These factors include the enormous number of sellers and transactions, the low dollar value of most transactions, and the many subtle and hard-to-detect ways that Amazon can skew outcomes to favor its own interests. Therefore, oversight must be combined with structural separation, which would do much of the work by removing the underlying conflicts of interest, thus allowing for an effective and less bureaucratic system of oversight.").

AR_003674

3. Promote Innovation Through Interoperability and Open Access

As discussed elsewhere in the Report, digital markets have certain characteristics—such as network effects, switching costs, and other entry barriers—that make them prone to tipping in favor of a single dominant firm. As a result, these markets are no longer contestable by new entrants,[2434] and the competitive process shifts from "competition *in* the market to competition *for* the market."[2435]

This dynamic is particularly evident in the social networking market. As discussed earlier in the Report, Facebook's internal documents and communications indicate that due to strong network effects and market tipping, the most significant competitive pressure to Facebook is from within its own family of products—Facebook, Instagram, Messenger, and WhatsApp—rather than from other social apps in the market, such as Snapchat or Twitter. In the case of messaging apps, Facebook's documents show that network effects can be even more extreme. And because Facebook is not interoperable with other social networks, its users face high costs to switch to other platforms, locking them into Facebook's platform.

High switching costs are also present in other markets. In the smartphone market, switching costs include learning a new operating system, which can discourage users from leaving Google or Apple due to familiarity with their distinct operating systems, as well as the inability to easily port all of their data, such as messages, call history, and photos. In online commerce, sellers have high switching costs associated with their reputation. Sellers can be locked into an incumbent platform for online commerce if they are unable to transfer their reputation—ratings and customer reviews accrued over a long period of time—to a different platform. Switching costs involving data for other services, such as email, can also contribute to user lock-in.[2436] In response to these concerns, Subcommittee staff recommends that Congress consider data interoperability and portability to encourage competition by lowering entry barriers for competitors and switching costs for consumers. These reforms would complement vigorous antitrust enforcement by spurring competitive entry.

a. Interoperability

Interoperability is fundamental to the open internet.[2437] It is present in email, which is an open, interoperable protocol for communicating online regardless of a person's email service or the type of

[2434] Competition & Mkts. Auth. Report at 10–11.

[2435] *See* Stigler Report at 29; Michael Kades & Fiona Scott Morton, *Interoperability as a Competition Remedy for Digital Networks*, WASH. CTR. FOR EQUITABLE GROWTH 1 (Sept. 2020) (on file with Comm.) ("The monopolist operates in a market with significant network effects, scale and scope economies, and low distribution costs. Therefore, the competition that matters most is often *for* the market not *within* the market. Anticompetitive conduct is more likely to succeed. And, the harm to consumers greater because the market tends to be winner-take-all, or most.").

[2437] *See generally id.* at 18–24.

device they use to send the email.[2438] It has also been built into numerous other services online[2439] and is a "core technical structure of the Internet."[2440] Interoperability standards are also present in other communications systems, from telephones to telegraphs.[2441] Telecommunications would not work without the ability of users on one carrier's network to interconnect with other carriers.[2442] And in the absence of interoperability, dominant carriers could foreclose new entrants from offering lower prices or better services, reinforcing their monopoly power while harming consumers and competition.[2443]

An interoperability requirement would allow competing social networking platforms to interconnect with dominant firms to ensure that users can communicate across services.[2444] Foremost, interoperability "breaks the power of network effects" by allowing new entrants to take advantage of existing network effects "at the level of the market, not the level of the company."[2445] It would also lower switching costs for users by ensuring that they do not lose access to their network as a result of switching.

The implementation cost of requiring interoperability by dominant firms would be relatively low. Unlike interconnecting in traditional communications markets, there is little direct cost associated with interoperating with dominant platforms.[2446]

("Interoperability is an anti-monopoly tool that has been used successfully many times to promote innovation by reducing barriers to entering markets.").

[2445] Michael Kades & Fiona Scott Morton, *Interoperability as a Competition Remedy for Digital Networks* 13–14 (Sept. 2020) (on file with Comm.).

[2446] *Id.* at 15 ("Unlike the familiar AT&T example, there would be no cost to interconnection in the digital platform context. The standard is simply a way to present and transfer information that is already being presented and transferred. No wire needs to be connected to achieve it, nor do machines need to be co-located, or special workers employed. Transferring digital files has almost zero cost, but regardless of that cost, Facebook would be transferring those files to serve its users in any case. Facebook might need to pay some costs to redesign the format in which it transfers text and images, but if it has been found liable for monopolization by a court, it is expected that a remedy will have costs. The real cost of ongoing interoperability to Facebook.com is the possibility that it loses customers once the barriers to entry fall. But that risk is what every firm faces in a competitive market and represents a benefit to consumers.").

Finally, interoperability is an important complement, not substitute, to vigorous antitrust enforcement. As discussed in this Report, Facebook has tipped the social network toward a monopoly, and due to its strong network effects, does not face competitive pressure. On its own, interoperability is unlikely to fully restore competition in the social networking market due to the lack of meaningful competition in the market today. On the other hand, in the absence of pro-competitive policies like interoperability, it is also possible that enforcement alone may provide incomplete relief due to future market tipping.[2447]

b. Data Portability

Data portability is also a remedy for high costs associated with leaving a dominant platform. These costs present another barrier to entry for competitors and a barrier to exit for consumers. Dominant platforms can maintain market power in part because consumers experience significant frictions when moving to a new product.[2448] Users contribute data to a platform, for example, but can find it hard to migrate that data to a rival platform.[2449] The difficulty of switching tends to keep users on incumbent platforms.[2450] Providing consumers and businesses with tools to easily port or rebuild their social graph, profile, or other relevant data on a competing platform would help address these concerns.[2451] Although complementary to interoperability, data portability alone would not fully address concerns related to network effects since consumers would still need to recreate their networks on a new platform and would not be able to communicate with their network on the incumbent platform.[2452]

[2447] *Id.* at 10. ("A divestiture may reduce the existing market power of the dominant network but not eliminate the market power due to network effects that was achieved through anticompetitive conduct. And, alone, divestiture may not prevent future tipping. Thus, on their own, they risk being insufficient to fully restore the lost competition.").

Warner (D-VA), Josh Hawley (R-MO), and Richard Blumenthal (D-CT) introduced S.2648, the "Augmenting Compatibility and Competition by Enabling Service Switching (ACCESS) Act," bipartisan legislation to require that dominant platforms make user data portable and their services interoperable. Additionally, this proposal would also allow users to delegate management of their privacy preferences to a third-party service. Press Release, Sen. Mark R. Warner, Senators Introduce Bipartisan Bill to Encourage Competition in Social Media (Oct. 22, 2019), https://www.warner.senate.gov/public/index.cfm/2019/10/senators-introduce-bipartisan-bill-to-encourage-competition-in-social-media.

4. Reduce Market Power Through Merger Presumptions

The firms investigated by the Subcommittee owe part of their dominance to mergers and acquisitions. Several of the platforms built entire lines of business through acquisitions, while others used acquisitions at key moments to neutralize competitive threats. Although the dominant platforms collectively engaged in several hundred mergers and acquisitions between 2000-2019, antitrust enforcers did not block a single one of these transactions. The Subcommittee's investigation revealed that several of these acquisitions enabled the dominant platforms to block emerging rivals and undermine competition.

Despite a significant number of ongoing antitrust investigations, the dominant platforms have continued to pursue significant deal-making. Over the last year, for example, Google purchased Fitbit for $2.1 billion and Looker for $2.6 billion; Amazon purchased Zoox for $1.3 billion; and Facebook acquired Giphy for an undisclosed amount.[2453] Meanwhile, all four of the firms investigated by the Subcommittee have recently focused on acquiring startups in the artificial intelligence and virtual reality space.[2454]

Ongoing acquisitions by the dominant platforms raise several concerns. Insofar as any transaction entrenches their existing position, or eliminates a nascent competitor, it strengthens their market power and can close off market entry. Furthermore, by pursuing additional deals in artificial intelligence and in other emerging markets, the dominant firms of today could position themselves to control the technology of tomorrow.

It is unclear whether the antitrust agencies are presently equipped to block anticompetitive mergers in digital markets. The record of the Federal Trade Commission and the Justice Department in this area shows significant missteps and repeat enforcement failures. While both agencies are currently pursuing reviews of pending transactions, it is not yet clear whether they have developed the analytical tools to challenge anticompetitive deals in digital markets. For example, the Justice Department in February permitted Google's acquisition of Looker, a data analytics and business intelligence startup, despite serious risks that the deal would eliminate an independent rival and could allow Google to cut

[2453] Chaim Gartenberg, *Google buys Fitbit for $2.1 billion*, THE VERGE (Nov. 1, 2019), https://www.theverge.com/2019/11/1/20943318/google-fitbit-acquisition-fitness-tracker-announcement; Lauren Feiner & Jordan Novet, *Google cloud boss Thomas Kurian makes his first big move — buys Looker for $2.6 billion*, CNBC (June 6, 2019), https://www.cnbc.com/2019/06/06/google-buys-cloud-company-looker-for-2point6-billion.html; Karen Weise & Erin Griffith, *Amazon to Buy Zoox, in a Move Toward Self-Driving Cars*, N.Y. [2454] *See infra* Appendix.

off access to rivals.[2455] These concerns are especially acute today, given the combined national health and economic crises, which have widened the gap between the dominant platforms and businesses across the rest of the economy.

To address this concern, Subcommittee staff recommends that Congress consider shifting presumptions for future acquisitions by the dominant platforms. Under this change, any acquisition by a dominant platform would be presumed anticompetitive unless the merging parties could show that the transaction was necessary for serving the public interest and that similar benefits could not be achieved through internal growth and expansion. This process would occur outside the current Hart-Scott-Rodino Act (HSR) process, such that the dominant platforms would be required to report *all* transactions and no HSR deadlines would be triggered. Establishing this presumption would better reflect Congress's preference for growth through ingenuity and investment rather than through acquisition.

5. <u>Create an Even Playing Field for the Free and Diverse Press</u>

The free and diverse press—particularly local press—is the backbone of a healthy and vibrant democracy. But as discussed in this Report, the rise of market power online has corresponded with a significant decline in the availability of trustworthy sources of news.[2456] Through dominating both digital advertising and key communication platforms, Google and Facebook have outsized power over the distribution and monetization of trustworthy sources of news online,[2457] creating an uneven playing field in which news publishers are beholden to their decisions.[2458]

To address this imbalance of bargaining power, we recommend that the Subcommittee consider legislation to provide news publishers and broadcasters with a narrowly tailored and temporary safe harbor to collectively negotiate with dominant online platforms.

In April 2019, Subcommittee Chairman Cicilline and Doug Collins (R-GA), the former-Ranking Member of the Committee on the Judiciary, introduced H.R. 2054, the "Journalism

---

[2456] Free and Diverse Press Hearing at 3 (statement of David Chavern, Pres. & CEO, News Media Alliance) ("In effect, a couple of dominant tech platforms are acting as regulators of the digital news industry.").

[2457] Submission of Source 52, to H. Comm. on the Judiciary, 12 (Oct. 30, 2019) (on file with Comm.).

[2458] Submission from Source 53, to H. Comm. on the Judiciary, 7 (Oct. 14, 2019) (on file with Comm.). Although Apple News and Apple News Plus are increasingly popular news aggregators, most market participants that the Subcommittee received evidence from during the investigation do not view it as a critical intermediary for online news at this time. Some publishers raised competition concerns about the tying of payment inside Apple's news product.

Competition and Preservation Act of 2019."[2459] H.R. 2054 would allow coordination by news publishers under the antitrust laws if it: (1) directly relates to the quality, accuracy, attribution or branding, or interoperability of news; (2) benefits the entire industry, rather than just a few publishers, and is non-discriminatory to other news publishers; and (3) directly relates to and is reasonably necessary for these negotiations, instead of being used for other purposes. As Subcommittee Chairman Cicilline noted at the time of the bill's introduction:

> The free press is a cornerstone of our democracy. Journalists keep the public informed, root out corruption, and hold the powerful accountable. This bill will provide a much-needed lifeline to local publishers who have been crushed by Google and Facebook. It's about time we take a stand on this issue.[2460]

Mr. Collins added that the proposed legislation would allow "community newspapers to more fairly negotiate with large tech platforms that are operating in an increasingly anti-competitive space," which would "help protect journalism, promote competition and allow communities to stay informed."[2461]

We recommend the consideration of this legislation as part of a broader set of reforms to address the rise of market power online. This proposed legislation follows a long congressional tradition of allocating coordination rights to individuals or entities that lack bargaining power in a marketplace.[2462] Although antitrust exemptions have been disfavored, at various times lawmakers have created exemptions in order to rectify imbalances of power or to promote non-competition values.[2463] In this instance, the risk associated with antitrust exemptions to preserve the free and diverse press—a bedrock constitutional value—is low, while the benefits of preserving access to high-quality journalism are difficult to overstate. As discussed earlier in the Report, the bill would follow steps that other jurisdictions are similarly taking to rebalance the power between news publishers and the dominant platforms.

6. Prohibit Abuse of Superior Bargaining Power and Require Due Process

By virtue of functioning as the only viable path to market, dominant platforms enjoy superior bargaining power over the third parties that depend on their platforms to access users and markets.

[2459] Press Release, Rep. David N. Cicilline, Collins Introduce Bill to Provide Lifeline to Local News (Apr. 3, 2019), https://cicilline.house.gov/press-release/cicilline-collins-introduce-bill-provide-lifeline-local-news.

[2460] *Id.*

[2461] *Id.*

[2462] *See generally* Submission from Sanjukta Paul, Ass't Prof. of Law, Wayne State Univ., to H. Comm. on the Judiciary, 2–4 (Apr. 21, 2020) (on file with Comm.) [hereinafter Paul Submission].

[2463] *See, e.g.*, Clayton Act, 15 U.S.C. § 17 (1914); Capper-Volstead Act, ch. 57, 42 Stat. 388–89 (1922) (codified as amended at 7 U.S.C. §§ 291, 292 (2012)).

Their bargaining leverage is a form of market power,[2464] which the dominant platforms routinely use to protect and expand their dominance.

Through its investigation, the Subcommittee identified numerous instances in which the dominant platforms abused this power. In several cases, dominant platforms used their leverage to extract greater money or data than users would be willing to provide in a competitive market. While a firm in a competitive market would lose business if it charged excessive prices for its goods or services because the customer would switch to a competitor, dominant platforms have been able to charge excessive prices or ratchet up their prices without a significant loss of business. Similarly, certain dominant platforms have been able to extort an ever-increasing amount of data from their customers and users, ranging from a user's personal data to a business's trade secrets and proprietary content. In the absence of an alternative platform, users effectively have no choice but to accede to the platform's demands for payment whether in the form of dollars or data.

The Subcommittee's investigation found that dominant platforms have also leveraged their market power in negotiations with businesses and individuals to dictate the terms of the relationship. The dominant platforms frequently impose oppressive contractual provisions or offer "take-it-or-leave-it" terms in contract negotiations—even when dealing with relatively large companies represented by sophisticated counsel.[2465] Lacking bargaining power, dependent third parties often find themselves at the whims of the platform's arbitrary decisions. Subcommittee staff encountered numerous instances in which a third party had been abruptly delisted or demoted from a platform, without notice or explanation, and often without a clear avenue for recourse.

The dominant platforms' ability to abuse their superior bargaining power in these ways can cause long-term and far-reaching harm. To address these issues, the Subcommittee recommends that Congress consider prohibiting the abuse of superior bargaining power, including through potentially targeting anticompetitive contracts, and introducing due process protections for individuals and businesses dependent on the dominant platforms.[2466]

B. Strengthening the Antitrust Laws

1. Restore the Antimonopoly Goals of the Antitrust Laws

The antitrust laws that Congress enacted in 1890 and 1914—the Sherman Act, the Clayton Act, and the Federal Trade Commission Act—reflected a recognition that unchecked monopoly power poses a threat to our economy as well as to our democracy.[2467] Congress reasserted this vision through subsequent antitrust laws, including the Robinson-Patman Act of 1936, the Celler-Kefauver Act of 1950, and the Hart-Scott-Rodino Act of 1976.[2468]

In the decades since Congress enacted these foundational statutes, the courts have significantly weakened these laws and made it increasingly difficult for federal antitrust enforcers and private plaintiffs to successfully challenge anticompetitive conduct and mergers.[2469] By adopting a narrow construction of "consumer welfare" as the sole goal of the antitrust laws, the Supreme Court has limited the analysis of competitive harm to focus primarily on price and output rather than the competitive process[2470]—contravening legislative history and legislative intent.[2471] Simultaneously, courts have adopted the view that underenforcement of the antitrust laws is preferable to overenforcement, a position at odds with the clear legislative intent of the antitrust laws, as well as the view of Congress that private monopolies are a "menace to republican institutions."[2472] In recent decades, the Justice Department and the Federal Trade Commission have contributed to this problem by taking a narrow view of their legal authorities and issuing guidelines that are highly permissive of market power and its abuse. The overall result is an approach to antitrust that has significantly diverged from the laws that Congress enacted.

[2467] *See generally* First & Fox Submission at 10–11; Steinbaum Submission; Submission from Robert H. Lande, Venable Prof. of Law, Univ. of Balt. Sch. of Law, to H. [2470] Jonathan Sallet, *Protecting the "Competitive Process"—The Evolution of Antitrust Enforcement in the United States*, WASH. CTR. FOR EQUITABLE GROWTH (Oct. 31, 2018), https://equitablegrowth.org/competitive-edge-protecting-the-competitive-process-the-evolution-of-antitrust-enforcement-in-the-united-states/.

[2471] Submission from John Newman, Assoc. Prof. of Law, Univ. of Miami Sch. of Law, to the Subcomm. on Antitrust, Commercial and Admin. Law of the H. Comm. on the Judiciary, 2 (Apr. 1, 2020) (on file with Comm.) [hereinafter Newman Submission]; Stucke Submission at 2.

[2472] 21 CONG. REC. 3146 (1890) (statement of Sen. Hoar).

In part due to this narrowing, some of the anticompetitive business practices that the Subcommittee's investigation uncovered could be difficult to challenge under current law.[2473] In response to this concern, this section identifies specific legislative reforms that would help renew and rehabilitate the antitrust laws in the context of digital markets. In addition to these specific reforms, the Subcommittee recommends that Congress consider reasserting the original intent and broad goals of the antitrust laws by clarifying that they are designed to protect not just consumers, but also workers, entrepreneurs, independent businesses, open markets, a fair economy, and democratic ideals.[2474]

2. Invigorate Merger Enforcement

Section 7 of the Clayton Act of 1914 prohibits any transaction where "the effect of such acquisition may be substantially to lessen competition, or to tend to create a monopoly."[2475] In 1950, Congress passed the Celler-Kevauver Anti-Merger Act to broaden the types of transactions covered by the Clayton Act, specifically to include vertical mergers, conglomerate mergers, and purchases of assets.[2476]

As noted above, since 1998, Amazon, Apple, Facebook, and Google collectively have purchased more than 500 companies.[2477] The antitrust agencies did not block a single acquisition. In one instance—Google's purchase of ITA—the Justice Department required Google to agree to certain terms in a consent decree before proceeding with the transaction.[2478]

The Subcommittee's review of the relevant documents revealed that several of these acquisitions lessened competition and increased market power. In several cases, antitrust enforcers permitted dominant platforms to acquire a competitive threat. For example, documents produced during the investigation demonstrate that Facebook acquired Instagram to neutralize an emerging rival, while Google purchased Waze to eliminate an independent provider of mapping data. In other instances, the platform engaged in a series of acquisitions that enabled it to gain a controlling position across an entire supply chain or ecosystem. Google's acquisitions of DoubleClick, AdMeld, and AdMob, for example, let Google achieve a commanding position across the digital ad tech market.

2473 *See* Wu Submission at 2 ("If read broadly, the prohibitions on 'monopolization,' 'unfair means of competition,' and 'restraints on trade' could be used to handle the challenges of our time. But 'broadly' is manifestly not how the laws are read by the judiciary at this point. For the courts have grafted onto these laws burdens of proof, special requirements and defenses that are found nowhere in the statutes, and that have rendered the laws applicable only to the narrowest of scenarios, usually those involving blatant price effects. And it is this that makes the laws inadequate for the challenges presented by digital markets.").

2477 *See infra* Appendix.

2478 Stipulation and Order, United States v. Google Inc. & ITA Software Inc., No. 1:11-cv-00688 (D.D.C. 2011).

In light of this, Subcommittee staff recommends that Congress considers a series of reforms to strengthen merger enforcement.

a. Codify Bright-Line Rules and Structural Presumptions in Concentrated Markets

A major change in antitrust enforcement over the last few decades has been the shift away from bright-line rules in favor of "rule of reason" case-by-case analysis. Although the rule of reason approach is said to reduce errors in enforcement through fact-specific analysis, in practice the standard tilts heavily in favor of defendants.[2479] The departure from bright-line rules and presumptions has especially affected merger enforcement, where enforcers seeking to challenge a merger must fully prove that it will have anticompetitive effects, even in cases where the merging parties are dominant firms in highly concentrated markets. Scholarship by Professor John Kwoka of Northeastern University shows that the antitrust agencies acted in only 38% of all mergers that led to price increases, suggesting that the current approach to merger review is resulting in significant underenforcement.[2480]

To respond to this concern, the Subcommittee recommends that Members consider codifying bright-line rules for merger enforcement, including structural presumptions.[2481] Under a structural presumption, mergers resulting in a single firm controlling an outsized market share, or resulting in a significant increase in concentration, would be presumptively prohibited under Section 7 of the Clayton Act.[2482] This structural presumption would place the burden of proof upon the merging parties to show that the merger would not reduce competition. A showing that the merger would result in efficiencies should not be sufficient to overcome the presumption that it is anticompetitive. It is the view of Subcommittee staff that the 30% threshold established by the Supreme Court in *Philadelphia National Bank* is appropriate, although a lower standard for monopsony or buyer power claims may deserve consideration by the Subcommittee.

By shifting the burden of proof to the merging parties in cases involving concentrated markets and high market shares, codifying the structural presumption would help promote the efficient allocation of agency resources and increase the likelihood that anticompetitive mergers are blocked.

[2479] Michael A. Carrier, *The Rule of Reason: An Empirical Update for the 21st Century*, 16 GEO. MASON L. REV. 827 (2009).

[2480] JOHN KWOKA, MERGERS, MERGER CONTROL, AND REMEDIES 155 (2014).

[2481] For support of codifying the structural presumption, *see* Submission from John Kwoka, Finnegan Prof. of Econ., Northeastern Univ., to H. Comm. on the Judiciary, 3 (Apr. 17, 2020) (on file with Comm.) [hereinafter Kwoka Submission]; Submission from Michael Kades, Dir., Mkts. & Competition Pol'y, Wash. Ctr. for Equitable Growth et al., to H. Comm. on the Judiciary, 9 (Apr. 30, 2020) (on file with Comm.) [hereinafter Kades Submission]; Lande Submission at 5; Slaiman Submission at 3; Foer Submission at 9. *See also* Herbert Hovenkamp & Carl Shapiro, *Horizontal Mergers, Market Structure, and Burdens of Proof*, 127 YALE L.J. 1996 (2018); Steven C. Salop, *The Evolution and Vitality of Merger Presumptions: A Decision-Theoretic Approach*, 80 ANTITRUST L.J. 269 (2015).

[2482] Although some courts still follow the structural presumption adopted by the Supreme Court in *Philadelphia National Bank*, it is not universally followed, especially given the D.C. Circuit's decision in *United States v. Baker Hughes Inc.*, 908 F.2d 981 (D.C. Cir. 1990).

b. Protect Potential Rivals, Nascent Competitors, and Startups

The Subcommittee's investigation produced evidence that several of the dominant platforms acquired potential rivals and nascent competitors. Potential rivals are firms that are planning to enter or could plausibly enter the acquirer's market. Nascent competitors are firms whose "prospective innovation represents a serious future threat to an incumbent."[2483] In digital markets, potential rivals and nascent competitors play a critical role in driving innovation, as their prospective entry may dislodge incumbents or spur competition. For this reason, incumbents may view potential rivals and nascent competitors as a significant threat, especially as their success could render the incumbent's technologies obsolete.

To strengthen the law relating to potential rivals and nascent competitors, Subcommittee staff recommends strengthening the Clayton Act to prohibit acquisitions of potential rivals and nascent competitors. This could be achieved by clarifying that proving harm on potential competition or nascent competition grounds does not require proving that the potential or nascent competitor would have been a successful entrant in a but-for world.[2484] Given the patchwork of cases that are unfavorable to potential and nascent competition-based theories of harm, this amendment should also make clear that Congress intends to override this case law.[2485]

Since startups can be an important source of potential and nascent competition, the antitrust laws should also look unfavorably upon incumbents purchasing innovative startups. One way that Congress could do so is by codifying a presumption against acquisitions of startups by dominant firms, particularly those that serve as direct competitors, as well as those operating in adjacent or related markets.[2486]

Lastly, Subcommittee staff's review of relevant documents produced by the Federal Trade Commission and Justice Department demonstrated that the antitrust agencies consistently underestimated—by a significant margin—the degree to which an acquisition would undermine competition and impede entry. In light of this tendency, Subcommittee staff recommends that Congress consider strengthening the incipiency standard by amending the Clayton Act to prohibit acquisitions that "may lessen competition or tend to increase market power."[2487] Revising the law

would "arrest the creation of trusts, conspiracies, and monopolies in their incipiency and before consummation." [2488]

c. Strengthen Vertical Merger Doctrine

The Subcommittee's investigation identified several ways in which vertical integration of dominant platforms enabled anticompetitive conduct. For this reason, the Subcommittee recommends that Congress examine proposals to strengthen the law relating to vertical mergers. The current case law disfavors challenges to vertical mergers. Specifically, courts tend to defer to claims from the merging parties that the transaction will yield efficiencies through the "elimination of double marginalization" and are skeptical about claims that the merger will result in foreclosure.

To address this concern, the Subcommittee recommends that Congress explore presumptions involving vertical mergers, such as a presumption that vertical mergers are anticompetitive when either of the merging parties is a dominant firm operating in a concentrated market, or presumptions relating to input foreclosure and customer foreclosure.[2489]

3. Rehabilitate Monopolization Law

Section 2 of the Sherman Act makes it illegal to "monopolize, or attempt to monopolize, or combine or conspire with any other person or persons, to monopolize any part of the trade or commerce among the several States."[2490] Over recent decades, courts have significantly heightened the legal standards that plaintiffs must overcome in order to prove monopolization. Several of the business practices the Subcommittee's investigation uncovered should be illegal under Section 2. This section briefly identifies the relevant business practices and the case law that impedes effective enforcement of Section 2 of the Sherman Act.

a. Abuse of Dominance

Robert H. Lande, *The Merger Incipiency Doctrine and the Importance of 'Redundant' Competitors*, 2018 WIS. L. REV. 783 (2018).

[2488] S. REP. NO. 698 (1914) in EARL W. KINTNER, THE LEGISLATIVE HISTORY OF THE FEDERAL ANTITRUST LAWS AND RELATED STATUTES 1744–52 (1978) (noting that the Senate Judiciary Committee report stated that the purpose of the bill was to supplement the Sherman Act "by making these practices illegal, to arrest the creation of trusts, conspiracies, and monopolies in their incipiency and before consummation").

[2489] Kades Submission at 5; Jonathan Baker et al., *Five Principles for Vertical Merger Enforcement Policy*, 33 ANTITRUST 3 (2019).

[2490] Sherman Act, 15 U.S.C. § 2 (1890).

The Subcommittee's investigation found that the dominant platforms have the incentive and ability to abuse their dominant position against third-party suppliers, workers, and consumers. Some of these business practices are a detriment to fair competition, but they do not easily fit the existing categories identified by the Sherman Act, namely "monopolization" or "restraint of trade." Since courts have shifted their interpretation of the antitrust law to focus primarily on the formation or entrenchment of market power, and not on its exploitation or exercise, many of the business practices that Subcommittee staff identified as undermining competition in digital markets could be difficult to reach under the prevailing judicial approach.

To address this concern, Subcommittee staff recommends that Congress consider extending the Sherman Act to prohibit abuses of dominance.[2491] Furthermore, the Subcommittee should examine the creation of a statutory presumption that a market share of 30% or more constitutes a rebuttable presumption of dominance by a seller, and a market share of 25% or more constitute a rebuttable presumption of dominance by a buyer.[2492]

b. Monopoly Leveraging

The Subcommittee's investigation found that the dominant platforms have engaged in "monopoly leveraging," where a dominant firm uses its monopoly power in one market to boost or privilege its position in another market. For example, Google's use of its horizontal search monopoly to advantage its vertical search offerings is a form of monopoly leveraging. Although monopoly leveraging was previously a widely cognizable theory of harm under antitrust law, courts now require that use of monopoly power in the first market "actually monopolize" the secondary market or "dangerously threaten[] to do so."[2493] The Subcommittee's investigation identified several instances in which use of monopoly power in one market to privilege the monopolist's position in the second market injured competition, even if the conduct did not result in monopolization of the second market. For this reason, Subcommittee staff recommends overriding the legal requirement that monopoly leveraging "actually monopolize" the second market, as set out in *Spectrum Sports, Inc. v. McQuillan.*[2494]

c. Predatory Pricing

[2491] First & Fox Submission at 2; Foer Submission at 2–4; Newman Submission at 7–8; Stucke Submission at 14; Waller Submission at 13.

[2492] Waller Submission at 12.

[2493] 506 U.S. 447 (1993).

[2494] *Id. See also* Alaska Airlines, Inc. v. United Airlines, Inc., 948 F.2d 536 (9th Cir. 1991).

The Subcommittee's investigation identified several instances in which a dominant platform was pricing goods or services below-cost in order to drive out rivals and capture the market. For example, documents produced during the investigation revealed that Amazon had been willing to lose $200 million in a single quarter in order to pressure Diapers.com, a firm it had recognized as its most significant rival in the category. Amazon cut prices and introduced steep promotions, prompting a pricing war that eventually weakened Diapers.com. Amazon then purchased the company, eliminating its competitor and subsequently cutting back the discounts and promotions it had introduced.

Predatory pricing is a particular risk in digital markets, where winner-take-all dynamics incentivize the pursuit of growth over profits, and where the dominant digital platforms can cross-subsidize between lines of business. Courts, however, have introduced a "recoupment" requirement, necessitating that plaintiffs prove that the losses incurred through below-cost pricing subsequently were or could be recouped. Although dominant digital markets can recoup these losses through various means over the long term, recoupment is difficult for plaintiffs to prove in the short term. Since the recoupment requirement was introduced, successful predatory pricing cases have plummeted.[2495]

The Subcommittee recommends clarifying that proof of recoupment is not necessary to prove predatory pricing or predatory buying, overriding the Supreme Court's decisions in *Matsushita v. Zenith Ratio Corp.*,[2496] *Brooke Group Ltd. v. Brown & Williamson Tobacco Corp.*,[2497] and *Weyerhaeuser Co. v. Ross-Simmons Hardwood Lumber Co.*[2498]

d. Essential Facilities and Refusals to Deal

The Subcommittee's investigation uncovered several instances in which a dominant platform used the threat of delisting or refusing service to a third party as leverage to extract greater value or more data or to secure an advantage in a distinct market. Because the dominant platforms do not face meaningful competition in their primary markets, their threat to refuse business with a third party is the equivalent of depriving a market participant of an essential input. This denial of access in one market can undermine competition across adjacent markets, undermining the ability of market participants to compete on the merits.

To address this concern, the Subcommittee recommends that Congress consider revitalizing the "essential facilities" doctrine, the legal requirement that dominant firms provide access to their

[2495] Hubbard Submission at 20; Stucke Submission at 7; Teachout Submission at 12; Christopher R. Leslie, *Predatory Pricing and Recoupment*, 113 COLUM. L. REV. 1695 (2013).

[2496] 475 U.S. 574 (1986).

[2497] 509 U.S. 209 (1993).

[2498] 549 U.S. 312 (2007).

infrastructural services or facilities on a nondiscriminatory basis.[2499] To clarify the law, Congress should consider overriding judicial decisions that have treated unfavorably essential facilities- and refusal to deal-based theories of harm.[2500]

e. Tying

The Subcommittee's investigation identified several instances in which a dominant platform conditioned access to a good or service that the dominant platform controlled on the purchase or use of a separate product or service. This business practice undermines competition on the merits by enabling a firm with market power in one market to privilege products or services in a distinct market.

Although antitrust law has long treated tying by a monopolist as anticompetitive, in recent decades, courts have moved away from this position. Subcommittee staff recommends that Congress consider clarifying that conditioning access to a product or service in which a firm has market power to the purchase or use of a separate product or service is anticompetitive under Section 2, as held by the Supreme Court in *Jefferson Parish Hosp. Dist. v. Hyde*.[2501]

f. Self-Preferencing and Anticompetitive Product Design

The Subcommittee's investigation uncovered several instances in which a dominant platform used the design of its platform or service to privilege its own services or to disfavor competitors. This practice undermines competition by enabling a firm that controls an essential input to distort competition in separate markets. The Subcommittee recommends that Congress consider whether making a design change that excludes competitors or otherwise undermines competition should be a violation of Section 2, regardless of whether the design change can be justified as an improvement for consumers.[2502]

4. Additional Measures to Strengthen the Antitrust Laws

In response to the Subcommittee's requests for submissions, experts identified other proposals that Subcommittee staff believes warrant review by Congress. These include:

[2499] Submission from the Am. Antitrust Inst., to H. Comm. on the Judiciary, 4 (Apr. 17, 2020) (on file with Comm.) [hereinafter AAI Submission]; Waller Submission at 13.

[2500] Verizon Commc'ns Inc. v. Law Offices of Curtis v. Trinko, LLP, 540 U.S. 398 (2004); Pacific Bell Telephone Co. v. LinkLine Commc'ns, Inc., 555 U.S. 438 (2009).

[2501] 466 U.S. 2 (1984).

[2502] This would require overriding *Allied Orthopedic Appliances, Inc. v. Tyco Health Care Grp. LP*, 592 F.3d 991 (9th Cir. 2010).

- Overriding *Ohio v. American Express* by clarifying that cases involving platforms do not require plaintiffs to establish harm to both sets of customers;[2503]

- Overriding *United States v. Sabre Corp*., clarifying that platforms that are "two-sided," or serve multiple sets of customers, can compete with firms that are "one-sided";[2504]

- Clarifying that market definition is not required for proving an antitrust violation, especially in the presence of direct evidence of market power;[2505] and

- Clarifying that "false positives"—or erroneous enforcement—are not more costly than "false negatives"—or erroneous non-enforcement—and that, in relation to conduct or mergers involving dominant firms, "false negatives" are costlier.[2506]

C. Strengthening Antitrust Enforcement

1. Congressional Oversight

As discussed earlier in the Report, Congress has a strong tradition of performing vigorous oversight of the enforcement and adequacy of the antitrust laws. Over the last century, Congress at key moments responded forcefully to the courts' narrowing of antitrust laws, the rising tide of economic concentration, or other challenges to the sound and effective administration of the antitrust laws.[2507]

This tradition includes the creation of the Federal Trade Commission and concurrent enactment of the Clayton Antitrust Act in 1914, as both a response to the Supreme Court's narrow construction of the Sherman Act in 1911 and an effort to limit the discretion of the courts.[2508] It also includes Congress's broadening of merger enforcement to cover non-horizontal acquisitions and other transactions in the Celler-Kefauver Anti-Merger Act of 1950 as well as establishing a mechanism for judicial oversight of consent decrees in response to political interference in merger enforcement with

[2505] Hovenkamp Submission at 3–4; Newman Submission at 5–6.

[2506] Subcommittee staff believes that Congress could clarify that the views set out by then-Professor Frank Easterbrook in *The Limits of Antitrust*, 63 TEX. L. REV. 1 (1984) do not reflect the views of the Congress in enacting the antitrust laws. *See also* Submission from Bill Baer, Visiting Fellow, Brookings Inst., to H. Comm. on the Judiciary, 3 (May 19, 2020) (on file with Comm.) [hereinafter Baer Submission] ("That is my fundamental concern with the state of antitrust enforcement today. It is too cautious, too worried about adverse effects of "over enforcement" (so called Type I errors).").

[2507] *See generally,* Marc Winerman, *The Origins of the FTC: Concentration, Cooperation, Control, and Competition*, 71 ANTITRUST L.J. 1 (2003).

[2508] Clayton Act, 15 U.S.C. § 12; Fed. Trade Comm'n Act, 15 U.S.C. § 41.

the Tunney Act of 1974.[2509] Additionally, Congress has regularly investigated the rise and abuse of market power in important markets.[2510] In support of these efforts, Congress dedicated substantial congressional and agency resources to perform the task of identifying and responding to anticompetitive conduct.[2511]

In recent decades, Congress has departed from this tradition, deferring largely to the courts and to the antitrust agencies in the crafting of substantive antitrust policy.[2512] Its inaction has been read as acquiescence to the narrowing of the antitrust laws and has contributed to antitrust becoming "overly technical and primarily dependent on economics."[2513]

In other cases, congressional attention has fallen short as lawmakers tried to address competition problems without sustained efforts to implement enforcement changes, leading some reform efforts in recent decades to misfire.[2514] Responding to these concerns, Congress has increased appropriations and provided modest improvements to the Federal Trade Commission's budget and remedial authority during this period. But these efforts were insufficient without sustained support in the face of "ferocious opposition" from large defendants and businesses lobbying Congress.[2515]

To remedy these broader trends, Subcommittee staff recommends that Congress revive its long tradition of robust and vigorous oversight of the antitrust laws and enforcement, along with its

[2509] 5 U.S.C. § 16. *See also Consent Decree Program of the Dep't of Justice: Hearings Before the Subcomm. on Antitrust of the H. Comm. on the Judiciary, 85th Cong.* (1957); REPORT OF THE SUBCOMM. ON ANTITRUST OF THE H. COMM. ON THE JUDICIARY, CONSENT DECREE PROGRAM OF THE DEP'T OF JUSTICE, 86TH CONG., 1ST SESS. (1959).

[2510] In the 1990s, the Committee on the Judiciary conducted significant oversight of competition in the telecommunications market in the wake of the breakup of Ma Bell and through oversight of the 1982 consent decree. These efforts culminated in the passage of H.R. 3626, the "Antitrust and Communications Reform Act," by the House of Representatives in 1994 by a vote of 423 to 5. Chairman Jack B. Brooks introduced this bill—a precursor to the Telecommunications Act of 1996—to address monopolization in the telecommunications market. *See generally* H. REP. NO. 103-559 (1994); Robert M. Frieden, *The Telecommunications Act of 1996: Predicting the Winners and Losers*, 20 HASTINGS COMM. & ENT. L.J. 11, 57 n.8 (1997).

[2511] Submission from Alison Jones & William E. Kovacic, to H. Comm. on the Judiciary, 4 (Apr. 17, 2020) (on file with Comm.) [hereinafter Jones & Kovacic Submission].

[2512] Harry First & Spencer Weber Waller, *Antitrust's Democracy Deficit*, 81 FORDHAM L. REV. 2543, 2556 (2013) ("[D]espite a history of bipartisan congressional support for the importance of the antitrust laws and their enforcement, of late Congress has done little. And when it has done something, it has focused on the micro rather than the macro changes that have occurred in the field.").

[2513] *Id*. at 2559.

[2514] Jones & Kovacic Submission at 4 ("The miscalculation of Congress (and the agencies) about the magnitude of implementation tasks in this earlier period came at a high price. Implementation weaknesses undermined many investigations and cases that the federal agencies launched in response to congressional guidance. The litigation failures raised questions about the competence of the federal agencies, particularly their ability to manage large cases dealing with misconduct by dominant firms and oligopolists. The wariness of the federal agencies since the late 1970s to bring cases in this area—a wariness that many observers today criticize as unwarranted—is in major part the residue of bitter litigation experiences from this earlier period.").

[2515] *Id.* at 6.

commitment to ongoing market investigations and legislative activity. Additionally, greater attention to implementation challenges will enable Congress to better see its reform efforts through.

2. Agency Enforcement

Over the course of the investigation, the Subcommittee uncovered evidence that the antitrust agencies consistently failed to block monopolists from establishing or maintaining their dominance through anticompetitive conduct or acquisitions. This institutional failure follows a multi-decade trend whereby the antitrust agencies have constrained their own authorities and advanced narrow readings of the law. In the case of the Federal Trade Commission, the agency has been reluctant to use the expansive set of tools with which Congress provided it, neglecting to fulfill its broad legislative mandate. Restoring the agencies to full strength will require overcoming these trends.

As a general matter, Congress created the FTC to police and prohibit "unfair methods of competition,"[2516] and to serve as an "administrative tribunal" that carefully studied ongoing business practices and economic conditions.[2517] To enable the agency to carry out these functions, Congress assigned the Commission powers to "make rules and regulations for the purpose of carrying out the [FTC Act's] provisions," as well as broad investigative authority to compel business information and conduct market studies.[2518] Notably, Congress established the provision prohibiting "unfair methods of competition" to reach beyond the other antitrust statutes, "to fill in the gaps in the other antitrust laws, to round them out and make their coverage complete."[2519] Lawmakers delegated to the FTC the task of defining what constituted an "unfair method of competition," recognizing that an expert agency equipped to continuously monitor business practices would be best positioned to ensure the legal definition kept pace with business realities.

[2516] *See* S. REP. NO. 63-597, 13 (1914) ("The committee gave careful consideration to the question as to whether it would attempt to define the many and variable unfair practices which prevail in commerce and to forbid [them] . . . or whether it would, by a general declaration condemning unfair practices, leave it to the commission to determine what practices were unfair. It concluded that the latter course would be better, for the reason . . . that there were too many unfair practices to define, and after writing 20 of them into the law it would be quite possible to invent others.").

[2517] Neil W. Averitt, *The Meaning of "Unfair Methods of Competition" in Section 5 of the Federal Trade Commission Act*, 21 B.C. L. REV. 227 (1980); *see also* Marc Winerman, *The Origins of the FTC: Concentration, Cooperation, Control, and Competition*, 71 ANTITRUST L.J. 1 (2003).

[2518] 15 U.S.C. § 46.

[2519] Neil W. Averitt, *The Meaning of "Unfair Methods of Competition" in Section 5 of the Federal Trade Commission Act*, 21 B.C. L. REV. 227, 251 (1980) ("Section 5 is not confined to conduct that actually violates, or that threatens to violate, one of the other antitrust statutes. If it were limited to this extent it would be a largely duplicative provision. The legislative purpose instead assigned to Section 5 a broader role. It was to be an interstitial statute: it was to fill in the gaps in the other antitrust laws, to round them out and make their coverage complete. In addition to overt violations, therefore, Section 5 would reach closely similar conduct that violates the policy or 'spirit' of the antitrust laws, even though it may not come technically within its terms.").

In practice, however, the Commission has neglected to play this role. In its first hundred years, the FTC promulgated only one rule defining an "unfair method of competition."[2520] In 2015 the Commission adopted a set of "Enforcement Principles," stating that the FTC's targeting of "unfair methods of competition" would be guided by the "promotion of consumer welfare," a policy goal absent from any legislative directive given to the Commission.[2521] Since the adoption of this framework, the FTC has brought only one case under its standalone Section 5 authority.[2522] The agency has also failed to regularly produce market-wide studies, having halted regular data collection in the 1980s.[2523]

Together with the DOJ, the FTC has also chosen to stop enforcing certain antitrust laws entirely. For two decades, neither agency has filed a suit under the Robinson-Patman Act, which Congress passed in order to limit the power of large chain retailers to extract concessions from independent suppliers.[2524] In 2008, the Justice Department issued a report recommending that Section 2 of the Sherman Act be curbed dramatically.[2525] Although the report was subsequently rescinded, the Justice Department has not filed a significant monopolization case in two decades. Meanwhile, both agencies have targeted their enforcement efforts on relatively small players—including ice skating teachers and organists—raising questions about their enforcement priorities.[2526]

The agencies have also been hamstrung by inadequate budgets. In 1981, FTC Chairman Jim Miller won steep budget cuts at the Commission, a drastic rollback from which the agency has not yet recovered. Prior to this Congress, appropriations for both agencies have reached historic lows.[2527] To

restore the antitrust agencies to full strength, Subcommittee staff recommends that Congress consider the following:

- Triggering civil penalties and other relief for violations of "unfair methods of competition" rules, creating symmetry with violations of "unfair or deceptive acts or practices" rules;

- Requiring the Commission to regularly collect data and report on economic concentration and competition in sectors across the economy, as permitted under Section 6 of the FTC Act;

- Enhancing the public transparency and accountability of the antitrust agencies, by requiring the agencies to solicit and respond to public comments for merger reviews, and by requiring the agencies to publish written explanations for all enforcement decisions;[2528]

- Requiring the agencies to conduct and make publicly available merger retrospectives on significant transactions consummated over the last three decades;

- Codifying stricter prohibitions on the revolving door between the agencies and the companies that they investigate, especially with regards to senior officials;[2529] and

- Increasing the budgets of the Federal Trade Commission and the Antitrust Division.[2530]

3. Private Enforcement

Private enforcement plays a critical role in the nation's antitrust system. The Sherman Act and Clayton Act both include a private right of action. This reflected lawmakers' desire to ensure that those abused by monopoly power have an opportunity for direct recourse.[2531] It also reflected a recognition that public enforcers would be susceptible to capture by the very monopolists that they were supposed to investigate, necessitating other means of enforcement.

Empirical surveys of trends in antitrust enforcement indicate that private enforcement deters anticompetitive conduct and strengthens enforcement overall.[2532] In recent decades, however, courts

[2528] Mitchell Submission at 9–10.

[2529] *See* submission from Source 17.

[2530] *See* Baer Submission at 7–8; Kades Submission at 12–13.

[2531] *See, e.g.*, 51 CONG. REC. 9073 (1914) (remarks of Rep. Webb) (stating that private Section 7 remedies "open the door of justice to every man, whenever he may be injured by those who violate the antitrust laws, and give the injured party ample damages for the wrong suffered").

[2532] Joshua P. Davis & Robert H. Lande, *Toward an Empirical and Theoretical Assessment of Private Antitrust Enforcement*, 36 SEATTLE U. L. REV. 1269, 1276 (2013).

have erected significant obstacles for private antitrust plaintiffs, both through procedural decisions and substantive doctrine.

One major obstacle is the rise of forced arbitration clauses, which undermine private enforcement of the antitrust laws by allowing companies to avoid legal accountability for their actions.[2533] These clauses allow firms to evade the public justice system—where plaintiffs have far greater legal protections—and hide behind a one-sided process that is tilted in their favor.[2534] For example, although Amazon has over two million sellers in the United States, Amazon's records reflect that only 163 sellers initiated arbitration proceedings between 2014 and 2019.[2535] This data seems to confirm studies showing that forced arbitration clauses often fail to provide a meaningful forum for resolving disputes and instead tend to suppress valid claims and shield wrongdoing.[2536]

Several other trends in judicial decisions have hampered private antitrust plaintiffs, including in cases involving dominant platforms. To address these concerns, the Subcommittee recommends that Congress consider:

- Eliminating court-created standards for "antitrust injury"[2537] and "antitrust standing,"[2538] which undermine Congress's grant of enforcement authority to "any person . . . injured . . . by reason of anything forbidden in the antitrust laws;"[2539]

- Reducing procedural obstacles to litigation, including through eliminating forced arbitration clauses[2540] and undue limits on class action formation;[2541] and

Congressional Budget Office
Cost Estimate

September 27, 2022

At a Glance

H.R. 3843, Merger Filing Fee Modernization Act of 2021

As reported by the House Committee on the Judiciary on September 26, 2022

By Fiscal Year, Millions of Dollars	2022	2022-2027	2022-2032
Direct Spending (Outlays)	0	0	0
Revenues	0	0	0
Increase or Decrease (-) in the Deficit	0	0	0
Spending Subject to Appropriation (Outlays)	0	-1,405	not estimated

Statutory pay-as-you-go procedures apply?	No	**Mandate Effects**	
		Contains intergovernmental mandate?	No
Increases on-budget deficits in any of the four consecutive 10-year periods beginning in 2033?	No	Contains private-sector mandate?	Yes, Over Threshold

The bill would

- Change the structure and amount of premerger filing fees levied by the Federal Trade Commission under its Premerger Notification Program
- Impose mandates by raising the fees for companies that file premerger notifications

Estimated budgetary effects would mainly stem from

- Decreases in spending subject to appropriation because of increases in fee collections

Detailed estimate begins on the next page.

See also *CBO's Cost Estimates Explained*, www.cbo.gov/publication/54437;
How CBO Prepares Cost Estimates, www.cbo.gov/publication/53519; and *Glossary*, www.cbo.gov/publication/42904.

Bill Summary

H.R. 3843 would change the structure and the amount of filing fees levied by the Federal Trade Commission (FTC) under its Premerger Notification Program. That program requires companies to notify the FTC and the Department of Justice (DOJ) before proceeding with a large merger or acquisition. The bill also would adjust filing fee amounts each year based on changes in the Consumer Price Index; under current law, fee amounts remain unchanged from year to year.

Estimated Federal Cost

The estimated budgetary effect of H.R. 3843 is shown in Table 1. The costs of the legislation fall within budget functions 370 (commerce and housing credit) and 750 (administration of justice).

Table 1.
Estimated Increases in Spending Subject to Appropriation Under H.R. 3843

	By Fiscal Year, Millions of Dollars						
	2022	2023	2024	2025	2026	2027	2022-2027
Estimated Authorization	0	-110	-294	-314	-333	-354	-1,405
Estimated Outlays	0	-110	-294	-314	-333	-354	-1,405

Basis of Estimate

CBO assumes that H.R. 3843 will be enacted near the end of calendar year 2022 and that the new fee structure would be effective starting on January 1, 2023.

Filing Fees

As of March 3, 2022 (the last time the ranges were updated), companies must pay the following filing fees based on the size of the transaction:

- $45,000 if the transaction size is between $101 million and $202 million,
- $125,000 if the transaction size is between $202 million and $1 billion, or
- $280,000 if the transaction size is $1 billion or greater.

The transaction size ranges are updated annually based on changes in the gross national product. Filing fees are collected by the FTC and distributed evenly between the FTC and the DOJ’s Antitrust Division and credited to their respective salaries and expenses appropriations accounts as discretionary offsetting collections.

The bill would change the number of ranges for transaction size and would require acquiring companies to pay the following filing fees:

- $30,000 if the transaction size is between $92 million and $161.5 million,
- $100,000 if the transaction size is between $161.5 million and $500 million,
- $250,000 if the transaction size is between $500 million and $1 billion,
- $400,000 if the transaction size is between $1 billion and $2 billion,
- $800,000 if the transaction size is between $2 billion and $5 billion, and
- $2.25 million if the transaction size is at least $5 billion.

Spending Subject to Appropriation
Using information from the FTC about historic filings, CBO estimates that H.R. 3843 would increase filing fees by $1.4 billion over the 2023-2027 period. Because those collections are treated as discretionary offsetting collections they are shown as a reduction in spending subject to appropriation. CBO estimates that total collections would increase because the bill would create additional tiers with higher fees and would index those fees to changes in the Consumer Price Index.

For fiscal year 2022, the bill would authorize the appropriation of $252 million for DOJ's Antitrust Division's salaries and expenses account and $418 million for the FTC's salaries and expenses account. CBO has not estimated any budgetary effect for those authorizations because appropriations for 2022 have already been completed.

Pay-As-You-Go Considerations: None.

Increase in Long-Term Deficits: None.

Mandates

H.R. 3843 would increase the cost of an existing private-sector mandate on some businesses by increasing the fees to file a premerger notification with the FTC. CBO estimates that the aggregate cost of the private-sector mandate would be about $325 million in each of the first five years the mandate is in effect, exceeding the annual threshold established in the Unfunded Mandates Reform Act (UMRA) ($184 million in 2022, adjusted annually for inflation).

H.R. 3843 contains no intergovernmental mandates as defined in UMRA.

Estimate Prepared By

Federal Costs:

David Hughes (FTC)
Jon Sperl (DOJ)

Mandates: Fiona Forrester
